REPORTS

OF A

SPECIAL COMMITTEE ON BREECH-LOADING RIFLES.

Lieut.-Colonel H. C. FLETCHER, Scots Fusilier Guards, *President.*

Captain J. Rawlins, 48th Regiment. | Earl Spencer, K.G.
Captain W. C. Mackinnon, 3rd Regiment. | Edward Ross, Esq.

Captain R. W. Haig, R.A., *Secretary.*

REPORT ON SELECTION OF A BREECH-LOADING RIFLE FOR THE SERVICE.

(With reference to War Office Minute 21st March 1867 $\frac{85}{\text{Gen. No.}\ 1034}$, and to Minute 10th December 1867, $\frac{7669}{1385}$.)

The Committee have the honour to submit their final Report on Military Breech-loaders.

Position of the Committee in respect to the inquiry.

Before proceeding to details, it will be convenient to consider their position in connexion with this inquiry.

The Committee were originally appointed to award prizes offered by the Secretary of State for War for the best military arm, and for the best ammunition submitted in response to an advertisement of 22nd October 1866, $\frac{7669}{534}$.

This advertisement laid down certain strict conditions to which the arms were to conform.

Besides those which had reference to length, weight, and form of arm, which could be ascertained without experiment, there were others which could only be determined by practical tests.

Many arms were at once disqualified from competing for the prizes, and of those that were qualified a certain number only were considered worthy of a long-continued trial, the result of which was given at length in report No. 4905, $\frac{7669}{1459}$ 12th February 1868.

The consequence of adhering strictly to the conditions laid down in War Office advertisement, 22nd October 1866, was that at the very outset many promising arms were excluded from the competition, and it seemed possible that the best military breech mechanism might not be amongst those selected.

The Committee therefore examined very carefully the rejected arms, setting aside those which seemed to merit further trial, *vide* report, No. 4636, $\frac{7669}{1194}$, 4th July 1867.

The Committee to extend their inquiries.

At this stage of the proceedings, the Secretary of State for War decided that the Committee should extend their inquiries, with a view of deciding upon what breech-loading arm they would recommend for adoption into the service, *vide* minute, 10th December 1867, $\frac{7669}{1385}$.

The steps to be taken to carry out this object.

They therefore considered carefully the steps that should be taken for the carrying out of this object.

The competitive trials showed the Committee that in the manufacture of breech-loaders accurate shooting had not been considered as attentively as ingenious methods for closing the breech.

Failure of the competitive arms to reach the required standard.

The Committee had before them rifles of several calibres, of which the principal were the ·577 inch, ·5 inch, and the ·451 inch, but none of the arms submitted for the competition had reached the standard of accuracy laid down by the War Office, a standard which it was well known could readily be surpassed by muzzle-loaders shooting under similar conditions of weight, bore, and charge, and to which standard there appeared no reason that breech-loaders should not attain.

The system of breech mechanism does not affect the shooting of the arm.

It was further clear that the system of closing the breech by one or another kind of breech mechanism, if metal cartridges should be used, could not affect the accuracy of the arm, unless it was such as to preclude a cartridge case of dimensions sufficient to contain a suitable charge.

Questions to be settled independently.

The questions, therefore, of the weight of bullet, bore, grooving, weight and description of barrel, charge of powder and cartridge case, could be settled independently; and having determined these points it was considered that a decision on breech mechanisms which could not readily be compared when fired with cartridges of different lengths would be more easily arrived at. This question was also pressed on the attention of the Committee by several of the inventors, who asked to what barrel they should attach the improved breech mechanism which they desired to submit.

Evidence procured.

Before proceeding any further the Committee obtained the permission of the Secretary of State for War to procure evidence from distinguished gunmakers and others who had studied the subject of military arms.

The following were requested to assist the Committee, vizt. :—

Lieutenant-General C. Hay; Mr. C. W. Lancaster; Colonel H. St. J. Halford; Mr. Alexander Henry; Major G. V. Fosbery, V.C.; Colonel Haliday (Inspector General of Musketry); Mr. J. H. Burton; Colonel W. M. Dixon (Superintendent R. S. A. Factories); Colonel E. M. Boxer (Superintendent Royal Laboratories); Mr. James Kerr; Mr. John Rigby; Mr. Whitworth; Mr. Westley Richards; Captain W. H. Noble, R.A.; Mr. F. A. Abel (Chemist War Department); Mr. Metford; Mr. Eley. Also H.R.H. the Field Marshal Commanding-in-Chief.

They all, with the exception of Mr. Eley and Mr. Metford, gave evidence, *vide* Appendix I.

Objects of the evidence.

The evidence was directed to ascertain—

1st. The most important qualifications of a military arm.

2nd. What bore, barrel, grooving, and ammunition appeared most likely to give those qualifications.

3rd. Whether there was a prospect of obtaining from a breech-loader as high a degree of excellence in these particulars as from a muzzle-loader.

4th. What was the best mode of arriving at these requirements.

5th. The method of stocking, the description of lock, and the quality of powder best adapted for a military arm.

On these points the evidence was clear, and the majority of the witnesses agreed in a very satisfactory manner.

The principal qualifications of a military arm.

All were of opinion that the principal qualifications required for an efficient military arm were strength, lightness and safety, flatness of trajectory and accuracy.

Stress was also laid by some of the witnesses on the importance of procuring a bullet of great penetrating power.

Recommendations to attain these qualifications.

To obtain these qualifications the majority of witnesses concurred in recommending a ·45 inch bore with a solid bullet of 480 grains, a charge of powder of 85 grains, and a central fire metallic cartridge case. The mode of rifling and chambering to remain open questions.

They also seemed satisfied that although the subject had not yet been fully worked out, there was nothing in the nature of breech-loaders to prevent their attaining to a high degree of accuracy of shooting.

Conditions to be laid down.

By many of the witnesses great importance was attached to the necessity of laying down conditions as to cartridge case, bore, and weight of bullet and powder, before commencing trials for accuracy of shooting.

On the method of stocking, the description of lock, and the quality of powder, the evidence was various and conflicting.

The future course of proceeding laid down.

With these opinions before them, which the results of the experiments made during the competitive trials fully corroborated, the Committee were able to decide their future course of proceeding.

Separation of the question of breech mechanism from that of barrel.

They determined on separating the question of breech mechanism from that of barrel. The former to be decided by an open competition of all the systems which either had been or should be brought before them. The latter to be confined to those systems of rifling which had given the best results as muzzle-loaders, viz., those of Messrs. Henry, Lancaster, Metford, Rigby, Westley Richards, Whitworth, and the Enfield represented by Colonels Dixon and Boxer, R.A.

Conditions fixed.

They decided on laying down the length, weight, and calibre of barrel.

Length of barrel.

The length to be 35 inches, as regulated by the War Office advertisement, which fixed the total length of the arm at 51 inches.

Weight.

The weight to be 4 lbs. 6 oz., viz., the weight of the Henry barrel, from which as yet the best results had been obtained, and the calibre to be ·45 inch, as appearing the most suitable for a military arm, not only from the results of the experience already gained and from the evidence received, but also from the reports of previous committees who had recommended that bore as likely to produce the best results. (*Vide* Appendix II., page 68.)

Cartridge case.

They decided on using the Government cartridge case, which as they have already reported (*vide* Report No. 4937, 16th March 1868, $\frac{7669}{1499}$) proved itself to be the best during the long course of the competitive trials.

Bullet, powder, and lubrication.

They also fixed the weight of bullet at 480 grains, of powder at 85 grains, and that the lubrication should be pure beeswax, as best adapted to withstand variations of climate and long keeping.

Henry breech action to be used during trials.

It was considered better that in the trial of the barrels the breech mechanisms should be identical in pattern, and the Snider system was at first selected; but as it appeared from information received from Colonel Dixon that a longer time would be required to produce a sufficient number of this description of breech action for a ·45 inch bore than to obtain the same number from Mr. Henry, it was resolved to adopt the Henry system, which had gained the prize of 600*l*.

Circular letter sent.

A circular letter embodying these conditions (*vide* Appendix XIX., page 85), was sent to the before-mentioned gentlemen on the 9th March 1868, and they were requested to inform the Committee whether they would assist them by preparing barrels under the conditions laid down.

Mr. Metford declines to assist.

Objections of Westley Richards and Colonel Boxer, R.A.

Mr. Metford declined to afford his assistance, but the replies from the other gentlemen were generally satisfactory, the exceptions being Mr. Westley Richards, who although agreeing to furnish barrels, stated that he could not undertake to obtain accurate shooting with ammunition made up as required, and Colonel Boxer, who considered it undesirable to lay down any particular weight or construction of bullet or weight of powder charge.

The committee adhere to the conditions laid down.

After consideration of these objections, the Committee bearing in mind the difficulties they had encountered in their first competition, owing to the latitude allowed in these respects, decided to adhere to all the conditions of the circular letter.

Experiments made during the preparation of the barrels.

During the preparation of the barrels, which occupied considerable time, the Committee continued the consideration of the breech mechanisms which were brought before them.

They were also engaged in trials of cartridges made with compressed powder, which the evidence of Colonel Boxer, R.A., Captain Noble, R.A., and Mr. Abel, chemist, W.D., led them to hope would prove satisfactory.

Having briefly stated the course which the Committee decided on adopting, the results of the trials of breech mechanisms, barrels, and powder are given under separate headings.

TRIALS OF BREECH MECHANISMS.

General course of experiments.

The general course of experiments to which the rifles submitted for trial in regard to their breech mechanisms were subjected was as follows:—

The arms were carefully examined, and, if approved, 20 or more shots were fired for rapidity. Sand was thrown over the breech actions both open and closed, and the rifle fired without any cleaning except what could be done with the hand. Three cartridges, purposely damaged to ensure an escape of gas, were fired to test the safety of the arm with imperfect ammunition.

If the arm passed through these trials satisfactorily, and if the breech action appeared suitable for military purposes, it was put through a course of long-continued firing, being allowed to rust at intervals between the days of firing.

Explanation of experiments.

Some exception may possibly be taken to this course of experiments. It may be urged that too great stress should not be laid on great rapidity, a satisfactory degree of excellence in this respect being all that should be required.

To this it is answered that a test for rapidity of firing involves also a test for simplicity and convenience of manipulation, and that the hurry and excitement which attend a trial for rapidity frequently develope some weakness of the arm which might otherwise escape notice.

The sand trial was imposed in order to represent the effects of dust or sand on arms when used in dry countries, especially in India. It is a severe test, but one which the best breech mechanisms pass through without being impeded in their working.

The long-continued firing and rust tests represent the ill-usage which arms in war time may have to endure; they also tend, like the test for rapidity, to draw forth any weakness which the firing of only a few shots might fail to develop.

The state of the inquiry.

Having thus shortly explained the nature of the experiments made to test the merits of the several breech mechanisms, it remains to describe the course of the trials and the results which were thereby arrived at.

The committee had before them for consideration—

The list of arms.

1st. The arms which had gone through the competitive trial, viz.:—

Albini and Braendlin, Burton, No. 1, Burton, No. 2, Fosbery, Henry, Joslyn, Martini, Peabody, Remington.	Vide Report, No. 4905, 12th Feb. 1868. $\frac{7669}{1459}$

2nd. Those which had been disqualified, but which had been set aside for further consideration, viz.:—

Berdan, Carter and Edwards, No. 3, Fosbery, No. 4, Greve and Dowling, No. 4, Hammond, Needham, No. 1, Poulteney, Westley Richards, No. 1, Westley Richards, No. 3 b, Sharp, Wilson.	Vide Report, No. 4636, 4th July 1867. $\frac{7669}{1194}$

3rd. Those which had been submitted since the dates of the above-mentioned reports, and previous to the 26th October 1868, after which date none were received, viz.:—

Adams,
Amsler-Milbank,
Bacon,
Berdan—with spiral spring lock,
Do. with side lock,
Do. sliding bolt,
Benson,
Braendlin-Snider,
Cole - - 0·577 inch
Do. - - 0·45 „
Conroy,
Cooper,
Chassepôt,
Davies,
Fosbery—an improvement 0·5 inch on systems previously submitted,
Do. 0·45 inch falling block,
Gordon,
Kerr,
Money-Walker,
Peabody, adapted for Boxer compressed powder cartridges,
Do. lever above instead of below, adapted for brass drawn central-fire cartridges,
Peabody-Gielgud,
Peabody-Gielgud-Wessely,
Prussian needle gun,
Punshon-Snider,
Reilly-Comblain,
Ross (P. Campbell),
Russian converted (needle rifle),
Russ and Hammond, metallic cartridge,
Do. paper do.
Roden-Snider,
Stoakes - - 0·577 inch
Do. - - 0·45 „
Stiff,
Tranter,
Wanzel,

Werndle,
Wilson,
Witney,
Wiley - - 0·577 inch
Do. - - 0·45 „
Westley Richards, paper cartridge,
Do. do. do. with a subsidiary lever for cocking,
Do. do. falling block, metallic cartridge,
Do. do. elevating block do. do.

The arms in the first list had been so carefully tested that no further information was required during the preliminary period of the investigation. The arms in the first list.

Out of the second and third lists a certain number were at once rejected, and those which appeared to possess most merit, having been put through the trials for rapidity and the tests with sand and damaged cartridges, were subjected to a further elimination. The causes of rejection are given in the Appendix III., page 69. The arms in the second and third lists.

The remainder, together with a few arms selected from the first list, were set aside to go through the trial of long-continued firing. The arms selected for further trial.

The eliminations were made at different periods of the inquiry, as the several arms were brought before the notice of the Committee; but (to avoid confusion) it has been thought well to include in one list all those selected as arms which appeared likely to fulfil the desired qualifications of a military breech-loader. The list is as follows, viz.:—

Bacon,
Berdan (one system),
Carter and Edwards,
Henry,
Kerr,
Martini,
Money-Walker,
Westley Richards (two systems, differing from those previously submitted),
Wilson.

For a description of these arms, *vide* Appendix IV., page 70.

It should be observed that several arms were placed in this list, not because they had proved themselves superior to those which had gone through the competitive trials, and which have been omitted, but because further experiments were needed to enable the Committee to compare their merits with the Henry and Martini arms, selected as possessing merits superior to those of the other arms which had passed through the competitive trials. Why these arms were selected.

As the selected arms were likely to be damaged during the course of experiments which it was proposed to carry out, it was decided, with the sanction of the Secretary of State for War, to purchase one arm of each system. One arm of each system bought.

All these arms were adapted to fire metallic cartridges, but, from the result of preliminary experiments, none were believed to be dependent for safety on the strength of their cartridge cases, but all were thought able to withstand the explosion of a defective cartridge. These arms adapted for metallic cartridges.

They may be divided broadly into two great systems, the bolt and the block, of which the Division into two systems.

Bacon,
Carter and Edwards,
Kerr,
Wilson,

represented the bolt; and the

Berdan,
Henry,
Martini,
Money-Walker,
Westley Richards (two systems),

the block.

It was after considerable doubt that the Committee selected for trial breech mechanisms on the bolt system, as from evidence they had received, and from their own observation, they were inclined to believe that there might be some danger lest a cartridge in a rifle on this system should explode, or be fired, before the bolt had been firmly secured. Doubt entertained of the bolt system.

Recommendations in favour of bolt systems.

On the other hand, the bolt system was simple in manipulation and manufacture; it had found favour with the armies of Prussia and France, and, in the systems selected for trial, apparently satisfactory mechanical arrangements had been made to secure the safety of the arms.

It was, therefore, decided to put the above-mentioned bolt systems through the long and exhaustive course of experiments to which the other rifles were to be subjected.

On selection of a cartridge.

It now became a matter of some importance to fix upon a cartridge with which the trials for breech mechanism should be made, as the working of some of the systems depended upon the length of cartridge they might be required to receive and to eject.

Difficulty in making a selection.

On this point there arose a difficulty. The trials for accuracy were not concluded, consequently neither the cartridge nor the bore had been definitely determined upon, and it still remained a matter of doubt whether compressed or loose powder would be the best adapted for securing accuracy of shooting.

Option as to bore left to inventors.

As the Committee were unwilling to postpone the trials for breech mechanism until those for accuracy were finished, it was decided to make it optional with the inventors of the selected breech mechanisms whether they would send in rifles suitable for a ·5 or ·45 inch bore cartridge.

It was also intended to make final experiments under similar conditions in regard to bore and cartridge, if, after the termination of the trials, the comparative merits of any of the arms should still remain doubtful.

Alterations made in Berdan and Martini arms.

As the Boxer cartridge case was used in the trials for accuracy, a preference was also given to it for the trials of breech mechanisms, consequently it became necessary to make alterations in two of the selected arms, viz., the Berdan and the Martini, to adapt them for this description of cartridge case. These alterations were made at the Royal Laboratory by the desire of the Committee, as the manufactory of the Berdan arms was in America, and of the Martini in Switzerland, and there were no working representatives in England.

Martini's specifications.

It should be observed that Mr. Martini in the specifications sent in with his competitive arms had stated that his system was adapted equally to central fire as to rim fire cartridges.

Westley Richards and Money-Walker arms.

The Westley Richards arms having been manufactured to receive a drawn brass cartridge case, and the Money-Walker to receive the Daw cartridge case, it was decided, to avoid delay, as their breech mechanisms were submitted at a late period of the inquiry, to make the necessary experiments with the cartridges for which they had been prepared.

The experiments made with the breech mechanisms carried on for the concluding trials have been already alluded to, and may be summarized as follows:—

Summary of experiments.

The rifles were fired for rapidity, and with cartridges purposely damaged at the base and side. Fine sand was thrown over the breech actions when open and when closed.

They were then subjected to a long course of firing, being allowed to remain uncleaned and under the influence either of rain, or of water artificially applied to the breech actions both open and closed, for several days and nights.

Exceptional trials of arms on the bolt system.

The arms on the bolt principle were also put through a trial with cartridges made exceptionally sensitive, to test their safety in the event of ammunition being thus accidentally manufactured.

For this purpose the Superintendent of the Royal Laboratories prepared cartridges containing 12 different descriptions of defects, which might possibly although rarely occur in the manufacture of large quantities of ammunition.

Mode of conducting the trials.

To test the safety of the arms, the cartridges so prepared, and loaded with coal dust instead of powder, were placed in the chamber and the bolt pushed against them with considerable force. They were also laid in the shoe and forced sharply home with the bolt. Should they have passed through these tests satisfactorily, an obstruction was placed in the shoe or chamber, to prevent the cartridge from freely entering the chamber, and the bolt was driven against the cartridge to force it into its place.

Why these trials were made.

These experiments were intended to represent what might possibly occur on service, with arms on the bolt system, as when firing rapidly the soldier would naturally endeavour to force home the cartridge by means of the bolt.

The last experiment was suggested by the accident which occurred in 1867 to Sir H. Halford, which he described in his evidence (*vide* Appendix I., page 15, questions 319 to 326).

The action of the breech-blocks of guns on the block system did not admit of similar experiments being made, on which account it was believed that they were not liable to similar accidents.

The following is a summary of the results of the several trials :—

Rapidity Trial.

Twenty-one rounds were fired from the shoulder, the cartridges being placed on a table, and the time of firing 20 rounds was obtained by observing the interval between the 1st and 21st shots.

Systems	Fired by	Min.	Sec.
Bacon, ·45 inch bore	Lieutenant Bacon	1	0
	do.	0	58
Berdan, ·45 inch bore	Serjeant Bott, R.M.	1	10
Carter and Edwards ·5 inch bore	Serjeant Bott	0	51
Henry, ·45 inch bore	Serjeant Ward, R.A.	1	17
	Private Crofts, R.M.	1	7
(*Vide* Appendix to Report, No. 4905 $\frac{7669}{1459}$, 12th February 1868.)			
Kerr, ·45 inch bore	Mr. Kerr	1	15
Martini, ·433 inch bore	Serjeant Bott, R.M.	1	2
Money-Walker, ·5 inch bore (Daw ammunition).	Mr. Walker	1	14
	Serjeant Bott	1	23
Westley Richards (falling block) ·45 inch bore	Foreman (Brass-drawn cartridge.)	1	7
Westley Richards (elevating block) ·45 inch bore	Foreman (Brass-drawn cartridge.)	1	0
Wilson, ·5 inch bore	Mr. Wilson	1	26

As the rifles were of different calibres, and as they all showed a satisfactory degree of rapidity, it was not thought necessary to have them fired by the same man, in order to obtain a more exact comparison than that here given.

Damaged Cartridges.

The cartridges were filed so as to ensure a considerable escape of gas. Three rounds were fired, the damaged part of the cartridge being placed in different positions.

The following are the results :—

Bacon	The extractor was blown away.
Berdan	Not affected by the trial.
Carter and Edwards	Do. do.
Henry	Do. do.
Kerr	Do. do.
Martini	Do. do.
Money-Walker	Do. do.
Westley Richards (Elevating block.)	Do. do.
Westley Richards (Falling block.)	Do. do.
Wilson	Do. do.

Sand Trial.

Bacon	Went through satisfactorily.
Berdan	Do. do.
Carter and Edwards	Do. do.
Henry	Do. do.
Kerr	Do. do.
Martini	Do. do.
Westley Richards (Elevating block.)	Do. do.
Westley Richards (Falling block.)	Do. do.
Wilson	Do. do.

Test for Exposure.

The test for exposure was as follows :—

A hundred rounds were fired on four consecutive days, and the rifles were left in the open air exposed to rain or to water artificially applied during the intervals, the breech actions being left alternately closed and open.

The rifles, still uncleaned, were left exposed during three or four days and nights, and were again fired for the purpose of ascertaining whether they were serviceable. They were then taken to pieces and examined.

The following results were obtained from this trial :—

Bacon. This rifle was not put through the exposure test, for the following reason :—When Serjeant Ward, R.A., was selecting some cartridges with which to try it, he placed a cartridge in the shoe and pushed it home with his thumb. He was in the act of closing the bolt when the cartridge exploded. The breech mechanism was separated from the barrel and destroyed, and that portion of the stock containing it was broken into pieces. The cartridge used was an ordinary one manufactured in the Royal Laboratory. The serjeant's face and hands were slightly injured.

Berdan. In this system, unless the block be carefully closed, the hammer is apt to fall on the hinge in place of on the striker. This defect was especially remarked after the first night's exposure. As the trial proceeded the breech block became jammed, and was opened with some difficulty. At the close of the trial the piston remained out, and force was needed to press it back. On being taken to pieces the side lock, as also the interior of the block, was rusty.

The quick and proper working of the breech block depends upon the hinge, (called by General Berdan "the brace,") which readily becomes affected by exposure.

Carter and Edwards. At the end of the exposure the bolt was set fast with rust, but was loosened by blows from a mallet, after which it worked stiffly. On stripping the gun the breech bolt and its bearings were much rusted, but the lock and piston worked well, and were comparatively free from rust.

Henry. The piston once jammed forward in the cap of the cartridge. The piston spring was found during the trial to be unserviceable, the piston remaining forward whenever pressed by the hammer. Another piston spring was substituted, one cartridge was accidentally placed in front of the extractor, and being thus held between the claw of the extractor and the end of the breech, was with difficulty forced out with a ramrod. Towards the close of this trial the piston remained out, but acted properly after a few rounds had been fired. At the end of the trial the extractor worked stiffly, and did not return of itself when the breech was opened. After oil had been applied it acted properly. On stripping the rifle the spring of the extractor was found to be broken, notwithstanding which it worked well. The spring was free from rust.

Kerr. After a considerable number of rounds, a small portion of the point of the keeper screw was found to be worn or broken by the repeated working of the breech bolt, but by screwing it a little further in, it again became serviceable. Towards the close of the trial the piston remained out, the sear spring was rusted and broken, and a new sear spring was substituted. Some difficulty was also noticed in ejecting the cartridge case. This was caused by the wearing away of the head of the keeper screw, consequently there was nothing to hinder the bolt, together with the extractor holding the empty cartridge case, from being drawn back beyond the proper distance. If this were done the base of the cartridge case caught in the shoe and did not fall out readily. On stripping the rifle there was a good deal of rust on the side lock, and the main spring was broken in two places.

This rifle was exchanged, at Mr. Kerr's request, for one he submitted with improvements, in which the keeper screw was at the side instead of underneath the breech action. This latter rifle was not submitted to the exposure tests, as, irrespective of the defect in the keeper screw, the Committee had formed their opinion on Mr. Kerr's system.

Martini. During the trial several of the cartridge cases cut, and more pressure than usual was required to open the breech block. Some of the iron discs of the cartridge cases also broke, in which case the extraction was difficult. These defects are entirely attributable to faulty cartridges, as was subsequently proved by the substitution of a fresh supply. The arm worked well during the trial, and when stripped the breech mechanism was in perfect order, and free from rust or dirt.

Money-Walker. In firing this arm the breech block required to be closed carefully, or with a smart blow. Care was also required in pushing the cartridges home, to prevent their catching in the extractor. As the trial advanced the breech mechanism worked with difficulty, and finally could not be opened with the hand, and the rifle became unserviceable. On stripping it the parts were found rusted.

Westley Richards, (elevating block, side extractor,) During the firing of the first 100 rounds the breech action was very hard to open after every shot, but worked easily enough when there was no cartridge in the rifle; the stiffness was therefore attributed to the setting up of the brass cartridge cases, which Mr. Westley Richards stated could be improved. At the close of the trial the breech

action was jammed, and on stripping the arm the whole of the breech action, including the main spring, was much rusted, and the arm was quite unserviceable. submitted with special cartridge.

At Mr. Westley Richards' request, this rifle was taken away and another with elevating block substituted. Westley Richards, (elevating block).

This arm worked stiffly, and during the first few rounds jammed, requiring blows to open the breech. This was probably owing to defects in the cartridge case, as previously mentioned. After the second night's exposure several parts of the breech action were found rusted, a few more rounds were fired, but the breech block jammed after every shot, and it was decided that it was unnecessary to continue the trial further. Mr. Westley Richards stated that by the application of a certain lubrication to his rifles, all possibility of their becoming rusted by exposure would be removed.

After the second night's exposure 50 rounds were fired, but as several cartridges burst at the rim, causing escape of gas and consequently some risk to the firer, it was decided to continue the trial for exposure without firing. At the conclusion of the trial the working of the action had not been affected by the exposure, but on stripping it all the parts were much rusted. It was also remarked that the wood of the stock on either side of the breech block was much warped and opened away from the breech action. Westley Richards, (falling block) No. 1.

During the firing on the first day, there was sometimes a difficulty in opening the breech. After the first night's exposure 60 rounds were fired, when the arm burst while being fired from the shoulder by Earl Spencer, who was slightly injured in the face. The breech bolt was blown back about an inch and the fore part of it was bent upwards and jammed. The piece of metal with lugs for taking the recoil was blown off with considerable force; it appeared to have struck the stock and glanced, as the wood was dented. Wilson.

Sensitive Cartridge Test.

A cartridge containing a cap with a rounded anvil, without shoulders, was purposely jammed in the entrance of the chamber, and force was used to push it home with the bolt; whilst doing this, and before the bolt was secured, the cap exploded. It was observed that the piston had been forced out by the concussion and had struck the cap. A like result was produced with a cap made up with a pointed anvil, without shoulders, but in this instance the cartridge had not been jammed in any way. Another cartridge with a similar defect was exploded in pushing forward the bolt, the cartridge not being jammed. Bacon.

The different sorts of sensitive cartridges were tried in this rifle; none, however, were exploded. The piston was not forced forward, and the concussion, which in some instances was very great, failed to fire or even to indent the cap. The cartridges were fired afterwards in the usual way to prove that they could be exploded. Carter and Edwards.

Similar experiments were made with this arm. A cartridge with a cap containing a long rounded anvil was purposely jammed in the entrance of the chamber, and force was used to push it home with the bolt; whilst doing this, and before the bolt was secured in its place, the cap exploded. It was remarked that the cap had been indented by the piston. A similar result was obtained when using a cartridge made up with a cap containing a pointed anvil, without shoulders. Kerr.

The improved rifle submitted by Mr. Kerr was subjected to these tests, and in every instance the cap was deeply indented by the piston, although no cartridge was exploded.

With this rifle only three sensitive cartridges were tried. They were not fired, but there were evident signs of the caps having been struck by the piston. Wilson.

During the course of these experiments the Committee were confirmed in the idea which they had previously entertained, that the bolt system of breech mechanism was not so safe as the block, from its greater liability to accident. Bolt system more liable to accident than block systems.

As has been already stated, two accidents had occurred during the trials from bolt guns, of a dangerous character, but happily without serious results. The rifles were so much damaged by the explosions that it was impossible to determine exactly the causes of these accidents. Accidents with bolt guns.

It appeared to be probable that the Bacon rifle exploded whilst the bolt was being pressed quietly home, either through a fault in the catch which held back the piston spring, or by the blow of the bolt on the base of the cartridge. Accident with the Bacon.

Accident with the Wilson.

The Wilson rifle exploded as it was being fired in the usual way. It is supposed that the bolt had not been secured, and that the special arrangement which was intended to prevent the piston from striking the cap until the breech was firmly closed had miscarried.

In both accidents pieces of the breech mechanisms were blown away; in that with the Wilson, the bolt only escaped being driven back into the firer's face through its being bent upwards by the explosion, and so becoming jammed in the shoe of the breech-block.

On bolt guns.

Irrespective of the evidence obtained from these accidents, the question of the security of bolt guns had been carefully considered during the course of the experiments, and a distinction had been drawn between those which worked by means of main and sear spring locks, like the Carter and Edwards, and Kerr, and those which worked with spiral springs, as the Bacon and Wilson.

On the Carter and Edwards and Kerr rifles.

Unless under exceptional circumstances the Carter and Edwards, and Kerr, were doubtless perfectly safe.

But, as has been already pointed out, when cartridges became jammed in the chamber and force was used to push them into it, the piston of the Kerr rifle, notwithstanding the precautions taken to keep it withdrawn, marked the caps sufficiently to explode them.

In the Carter and Edwards rifle this defect does not exist, no mark of the piston on the cap having on any occasion been noticed; but evidence had been received that among the many millions of cartridges manufactured, some caps so over sensitive would be found that even a fall of the cartridge on the floor of the manufactory would cause an explosion. If such were the case, the mere blow of the bolt (especially if the cartridge had become in any way jammed), irrespective of any projection of the piston, would appear sufficient to explode the cartridge.

Rejection of arms on the bolt system.

Under these circumstances, and having before them arms on the block system which appeared to unite all the required qualifications, without the disadvantages above mentioned, it was decided to reject from further consideration arms made on the bolt system.

Good qualities of the Carter and Edwards and Kerr rifles.

It was with great regret that the Committee arrived at this conclusion. They appreciated very highly the excellent qualities of the Carter and Edwards and Kerr rifles, and took into consideration the fact that the piston of the former had not marked the caps when undergoing the trial with sensitive cartridges.

Carter and Edwards.

There were, however, disadvantages connected with the Carter and Edwards system, which added their weight to the decision to reject it. First, the great length of the breech mechanism, especially when prepared for a ·45-inch cartridge. Secondly, the liability that exists of the rifle, when held at the "present," being accidentally placed on half cock by the left hand coming in contact with the handle of the bolt. Thirdly, the rusting of the long surfaces of the bolt and shoe, as was proved by the exposure tests. Notwithstanding these defects, the Committee entertain a high opinion of the facility and rapidity of manipulation of the breech mechanism of this system of arm.

Kerr.

The Kerr rifle also showed many excellent qualities, especially in its method of securing the bolt, and at the same time pushing the cartridge home into the chamber; also in its ingenious mode of extracting the empty cartridge case.

Consideration of arms on the block system.

The arms on the bolt system having thus been disposed of, those on the block system were next considered.

After weighing the results of the trials, the Berdan, Money-Walker, and Westley Richards (elevating block) were at once rejected, and there remained the Henry, the Martini, and the Westley Richards (falling block). Of these, the Henry and the

The Westley Richards arm.

Martini were deemed to possess superior excellence, as, although the Westley Richards worked with facility after the exposure test, yet the several parts of the breech block were much rusted and a weakness in the system of stocking was developed. The method of extracting the cartridge in the Martini arm was also preferred to that of the Westley Richards arm.

In regard to the rusting of his breech block, Mr. Westley Richards stated that a remedy could be easily applied by steeping the parts in a special lubrication; but as this had not been used in the other systems, which had gone through the trials without any need of lubrication to keep off rust, the experiment suggested was not thought desirable.

These decisions the Committee saw no reason to alter from subsequent representations, and patterns of proposed improvements submitted to them by Messrs. Simpson (on the part of the Carter and Edwards arm), Kerr, Westley Richards, and Wilson.

Application from Mr. Westley Richards.

On a special application from Mr. Westley Richards, dated 22d October 1868, in answer to a letter informing him of the rejection of his systems of breech mechanism, the Committee, having regard to the merits of the falling block arm, were prepared to consider an arm resembling, in nearly all respects, that already rejected, but on the 2d November 1868, Mr. Westley Richards decided on withdrawing his rifles, and the arms were accordingly returned to him. Judging from the results of the previous trial, the Committee are of opinion that this system is not equal in serviceability to either of those which were retained for consideration, viz., the Henry and the Martini.

The Henry and Martini systems.

Of these two systems, the Martini gave the best results in the trial for endurance, and consequently showed that the defects mentioned in the previous Report, No. 4,905, of the 12th February 1868, had been owing to the bursting of the defective ammunition submitted with the arm sent in for the competition.

Trials of Martini made with Boxer cartridge and compressed powder.

The present trials of this system (as before mentioned) were made with the Boxer cartridge case and compressed powder, which it was hoped at the time the trials were made would prove suitable for arms of a ·45-inch bore. But during these trials (as will be seen in a subsequent part of the Report), it was ascertained that ammunition made with loose powder was preferable as regarded accuracy to that made with compressed powder, and the loose powder entailed a longer cartridge case. It became, therefore, necessary to test the Martini system with the longer case, to ascertain whether any defect would thereby be developed.

The Martini arm to be tried with longer cartridge.

Mr. Martini was in Switzerland, and from previous experience (*vide* Report, 12th February 1868), the Committee were aware that great delay would ensue if the arm and gauges for cartridges on which to model a new breech block were transmitted to Switzerland.

The arm to be made at Enfield.

It was consequently decided (written communication having been made to Mr. Martini) to request Colonel Dixon, Superintendent Royal Small Arms Factories, to prepare an arm on the Martini system, to take the long cartridge case ·45-inch bore, and at the same time to make one or two minor alterations not affecting the principle of the breech mechanism.

The arm received.

The arm was received on the 21st October 1868, with some slight improvements not in any way affecting the principle, nor embodying any ingenious novelty belonging to other arms, such as seems to be referred to in section 5, War Office advertisement, 22d October 1866. At the same time it failed to represent perfectly the Martini system, as was pointed out by Mr. Martini, who in the meantime had arrived in England.

The Martini arm put through the trials.

The weight was slightly in excess of that laid down in the War Office advertisement, and adopted by the Committee as the maximum of weight for the future arm; but Mr. Martini pointed out how this could be reduced, and the arm was consequently put through the trials already mentioned, viz., the sand, damaged cartridge, exposure, and rapidity tests.

All these trials it passed through most satisfactorily. The rapidity, when fired by Serjeant Bott, R.M., was 20 rounds in 53 seconds, and when fired by Captain Mackinnon, after the arm had been exposed to the influence of rain or of water artificially applied for seven days and nights, and after it had fired during this period 400 rounds, was 20 rounds in 1 minute and 3 seconds. The breech action worked as smoothly after the exposure tests as it had done when the arm was clean, and in every case the extractor ejected the cartridge.

When taken to pieces and examined, the block containing the spiral (main) spring was entirely free from rust, and the other portions of the breech mechanism only slightly discoloured by it.

The Martini system suitable for a long cartridge case.

It was now apparent that the Martini system of breech mechanism was adapted equally for the longer as for the shorter cartridge, but it remained to be proved whether, with the weight reduced and made entirely on Mr. Martini's plan, it would be equally serviceable.

A new Martini to be made at Enfield.

An order for a breech mechanism, to be constructed under Mr. Martini's supervision, was therefore made on the Superintendent Royal Small Arms Factories.

Proposed improvements in the Henry arm.

In the meantime, Mr. Henry had submitted at different dates two models of proposed improvements in his system of breech mechanism; one to overcome the possibility of placing the cartridge in front of the extractor, the other to remedy the liability of the piston occasionally sticking in the caps of the cartridges, and so hindering or preventing the opening of the breech block.

The improvements of the Henry and Martini arms to be tested by trial.

As the Henry and Martini breech mechanisms appeared to the Committee to be those most likely to fulfil all the requirements of a military breech-loader, it was decided to procure one breech mechanism embodying Mr. Henry's latest improvements fitted to any barrel, to compete under similar conditions with the Martini arm in course of construction

at Enfield. The option was given to Mr. Henry either to make his own breech mechanism or to have the work performed at Enfield, and Mr. Henry elected to make the breech mechanism at his own manufactory.

The arms are received.

The arms were received and examined. The Martini arm made entirely on Mr. Martini's plan was found to be within the required weight. The Henry arm embodied a slight improvement to ensure the withdrawal of the piston after firing.

The arms were put through a course of long-continued firing, rough usage, and exposure, and the results were satisfactory.

Final selection to be made.

It now remained for the Committee to make a final selection from these two systems, both of which had given proofs of high excellence.

Points to be considered.

The principal points to be considered were—

Safety,
Strength,
Number and simplicity of parts,
Facility of manipulation,
Cost.

Safety.

Safety.—In regard to safety, both systems appeared equally secure against accident.

Strength.

In regard to strength, both systems necessitate divided stocks, which the Committee believe to be stronger, and without doubt cheaper than whole stocks. The method of securing the ends of the stocks to the breech-action in both the Henry and Martini arms appears sufficiently strong.

Number and simplicity of parts.

In the number and simplicity of the parts, the advantage lies with the Martini, the number in the Henry system, including the parts in the lock, are 49; the number in the Martini are 30.* (The screws and pins in both instances are included.)

Besides a greater number of detached pieces, the Henry arm has the manufacturing disadvantage of an extractor plate soldered on the barrel.

In simplicity of construction of these several parts, the Committee believe that the Martini has the superiority.

For drawings of the several parts of these arms, see Plates I. and II.

Facility of manipula-

In regard to facility of manipulation, both systems show remarkable excellence; they can be fired with great ease and rapidity. The absence of cocking gives a slight superiority to the Martini. In the Henry there is a possibility of placing the cartridge in front of the extractor. If this be done, there is considerably difficulty in withdrawing the cartridge over the claw of the extractor.

Cost.

In cost of manufacture the Committee believe from evidence received that the advantage lies with the Martini.

On side locks.

One other question occupied the attention of the Committee, viz., that of side locks. From the results of experience and from evidence, they believe that side locks are sometimes liable to become woodbound when exposed to wet. This disadvantage is obviated in the Martini lock, which is entirely contained in the metal breech-block.

Selection of the Martini breech mechanism.

After a careful consideration of the relative advantages and disadvantages of the two systems, and of the results of the many trials to which both have been subjected, the Committee decide on giving the preference to the Martini breech mechanism, and on recommending it as the one best qualified for a military arm of any that has been brought before them.

Comparison between the Martini and Snider.

It now remains to make a comparison under similar conditions between the Martini and the Snider breech mechanisms in use in the service.

Safety.

In safety the Martini is superior to the present Snider arm, as in the event of a defective cartridge being fired the block of the Snider is liable to be blown open. This defect has (it is believed) been remedied by the addition of a catch bolt in Snider arms of a more recent pattern.

Strength.

In strength the Committee believe that the divided stock on the Martini principle is stronger than the whole stocking of the Snider, the cutting away of the wood for the lock being a weakness in the Snider arm. They would add that both systems appear to be sufficiently strong. In strength of breech-action, after a careful comparison of the several parts, including pins, screws, and springs, the advantage lies with the Martini.

Number and simplicity of parts.

In number and simplicity the advantage lies with the Martini, the number in the Martini being 30,* in the Snider 39, and if the safety catch of the last pattern Snider be added, 43 parts. (For drawings of the several parts of the Snider arm without safety catch, see Plate III.)

* In the new pattern of the Martini breech machanism the three pieces belonging to the indicator have been dispensed with, as the new indicator forms one piece with the tumbler pin, thus reducing the number of parts to 27.

In regard to facility of manipulation the advantage lies with the Martini, especially if the long cartridge suitable for a ·45 inch bore be used. The loading of the Martini arm is fully as easy, if not easier, than that of the Snider. The extraction is far simpler, as it avoids two motions necessary in the Snider, one for extracting the cartridge from the chamber, the other for throwing it out by canting the arm to the right. Facility of manipulation.

In cost, from a comparison of the several parts of the two systems, especially if the question of stocking be considered, the Committee believe that the Martini system will be found cheaper to manufacture than the Snider. With regard to the stocking, it seems evident that the divided stocks are less costly than the whole stocks, possibly in manufacture, certainly in material. Cost.

According to an estimate received from Mr. Martini, it appears that he would undertake an order for 25,000 arms similar in pattern to that submitted for the previous competition, and including barrel and bayonet, at 63 francs per arm, or without barrel and bayonet, at 45 francs. The arms to be manufactured in Switzerland. This estimate Mr. Martini stated would give a considerable profit to the manufacturer.

According to an estimate received from Colonel Dixon, R.A., Superintendent Royal Small Arms Factories at Enfield, the Martini arm of the pattern made under Mr. Martini's supervision at Enfield could be manufactured without barrel, and including bayonet, at 2*l.* per arm.

The same remarks in respect to side locks made in the comparison of the Henry and Martini arms apply to a comparison of the Martini and Snider arms. Side locks.

After a careful comparison of the merits of the two systems, the Committee decide on recommending the Martini system of breech mechanism in preference to the Snider system. Preference given to the Martini over the Snider breech-action.

TRIALS OF BARRELS IN RESPECT TO ACCURACY, TRAJECTORY, PENETRATION, &c.

As has been already stated, the trials of barrels were kept perfectly distinct from those of breech mechanisms. Mode of conducting trials.

They were made from fixed rests, and, as far as was possible, under similar conditions.

The breech mechanisms to which the several barrels, with two exceptions, were attached, were identical in description and construction, and therefore their fittings in the fixed rests were similar.

Four barrels, with an interchangeable Henry breech mechanism, to be supplied by Mr. Henry, were required from each of the several gentlemen who had engaged to send in samples of rifling and ammunition, viz. :— Barrels, from whom supplied.

Messrs. Henry,
Lancaster,
Rigby,
Westley Richards,
Whitworth,
and
Colonels Dixon and Boxer.

And it was determined to fire 100 rounds from each of the barrels, at the several ranges, *i.e.* :— Number of rounds to be fired.

The 300 yards.
500 ,,
800 ,,
1,000 ,,

In targets of 20 shots each. Two barrels firing the 100 rounds without cleaning out; two with cleaning out after every 20 rounds, varying the barrels at each range.

A hope had been entertained that the trials might have been made simultaneously, but the different dates at which the barrels were received from the several manufacturers precluded the possibility of so doing. It was therefore determined that, should any of the systems give nearly similar results, they should be tested simultaneously, by firing them either down the range or at any selected distance. Mode of conducting comparative trials.

The exceptions in the fittings of the barrels (previously alluded to) arose from the trial of the ·5-inch rifles with Snider breech mechanism (to which reference will be made), and from a request of Mr. Westley Richards, that the Committee would test a complete arm with special cartridges and his own breech mechanism, in addition to one barrel sent in, in accordance with the conditions laid down by the Committee. The ·5-inch Snider and Westley Richards arms.

In conducting the experiments the Committee reserved to themselves the right of discontinuing the trials of the rifles which showed a marked inferiority of shooting to others, Right to discontinue trials reserved.

and which in no respect attained to the standard of accuracy laid down in the War Office advertisement, 22d October 1866.

Circular letter of 9th March 1868.

The circular letter containing the conditions was sent out on the 9th March 1868, and the barrels were received by the Committee on the following dates:—

Mr. Henry's	During the 1st week in June.
Mr. Whitworth's	The 2d week in August.
Colonel Dixon's	The 2d week in September.
Mr. Westley Richards	The 3d week in September.
(The arm submitted with drawn brass cartridges)	The 4th week in October.
Mr. Lancaster's	The 1st week in October.
Mr. Rigby's	The 4th week in October.
His ammunition	The 2d week in November.

It will be observed that Mr. Henry's barrels were received by the Committee at a much earlier date than those of the other gentlemen. This was partly owing to Mr. Henry having chambered his rifles without waiting for the gauges prepared at the Royal Laboratory, and partly to his having long turned his attention to the production of breech-loading rifles adapted to metal base cartridges for a ·45-inch bore.

Colonels Dixon and Boxer's report on ·5-inch.

In the interval between the sending out of the above-mentioned circular letter and the receipt of the barrels, a report from Colonels Dixon and Boxer, made to the Secretary of State for War on the 20th April 1868, had been submitted for the perusal of the Committee, in which, after a long course of experiments, these officers advocated a ·5-inch bore rifle, rather than a ·45-inch bore, on account of the greater tendency to fouling observed in the latter bore.

Decision to try a ·5-inch arm.

As this report was favourable to a ·5-inch bore, the Committee decided on trying the rifles made at Enfield of this bore, fitted to the Snider breech mechanism, in comparison with those of a ·45-inch bore, received in answer to their circular letter.

Details of shooting.

The details of the trials for accuracy of the several systems are now given.

The trials commenced on the 23d June 1868, by firing the ·45-inch bore Henry (four barrels) in comparison with two barrels of the ·5-inch Snider, and were continued at intervals as the barrels were received from the several gentlemen who were preparing them.

The following is a description of the barrels and ammunition, together with a summary of the results of the shooting at different distances, of which 500 yards was selected as the first at which the rifles should be tried. For a more detailed account of the shooting, see Appendix V., page 72.

Description of the Barrels and Ammunition.

Barrels of uniform Weight and Length. Weight 4 lb. 5 oz, length 35″.
Ammunition, Boxer Cartridge Case; Powder, Curtis & Harvey's No. 6,* 85 grains.

Rifle.	Bore.	Twist.	Number and Description of Grooves.	Cartridge. Description.	Cartridge. Length.	Cartridge. Weight.	Description of Bullet.	Length.	Diameter.

* Men were working behind the butt during the firing of the Henry rifle, and consequently it was necessary to make the point of impact lower than usual, in order to prevent the chance of a shot going over the target. Thus misses (short) occurred in shots which would otherwise have struck the target, and the average was consequently slightly deteriorated.
† *Vide* remark at 500 yards.
‡ Not sufficiently good at other ranges to warrant its being carried forward to this range.
§ *Vide* remark at 300 yards.

Mr. Westley Richards' arms.

In addition to the barrels submitted in answer to the circular letter of the 9th March 1868, two rifles with drawn brass cartridges were received and tried at the especial request of Mr. Westley Richards. The shooting of these rifles is given in detail in Appendix V., page 75, and it is sufficient to state that the systems did not appear to have been thoroughly worked out when brought before the notice of the Committee, and that the results in respect to accuracy were not nearly equal to those obtained from other barrels.

His cartridge.

At the same time the system of cartridge case submitted by Mr. Westley Richards, but which was first brought before the notice of the Committee by General Berdan's agent, appears to possess merit and may deserve consideration at a future day, if its further development should give satisfactory results. At present, in the form presented to the Committee, it is not equal to the Boxer cartridge case.

Comparison of the shooting.

Accuracy.

Trajectory.

From a comparison of the shooting at the several distances it will be seen that the Henry barrels were superior to the others in accuracy at all the distances, excepting 300 yards, at which distance the shooting of all the rifles was nearly equal, the Enfield showing an almost imperceptible superiority. In flatness of trajectory, judging from the angle taken by the clinometer, the Henry rifle was also practically equal to any of the other rifles of ·45 inch calibre, whilst, it was only slightly excelled in this particular at the shorter ranges by the ·5-inch bore.

But as during the long course of experiments it was discovered that it was difficult, if not impossible, to ascertain the true trajectory by firing from the fixed rests and laying the rifles by means of a clinometer, owing to the angle of departure of the bullet being so greatly dependent on the fittings of the rest, it was determined to carry out the experiments described in page 19 as the best means of obtaining the trajectories of rifles fired from the shoulder.

By reference to these experiments it will be seen that even at the shorter ranges the Henry ·45-inch had a flatter trajectory than the ·5 inch, and the truth of this conclusion was verified by the experiments made by Captain Noble, R.A. (given in page 20), which show a higher initial velocity in the ·45-inch than in the 0·5 inch Snider.

Fouling.

The defect of fouling supposed to attach to ·45 bore rifles was not observable in the Henry arm. The firing of 100 rounds without cleaning out produced no deterioration in the shooting, and when additional experiments were made, by firing intermediate targets of 20 shots with great rapidity, the accuracy of the shooting improved rather than deteriorated, *vide* Appendix V., page 75.

The Henry arm the best of the ·45 bores.

In every respect the Henry rifle may be taken as the most favourable type of arm of a ·45-inch calibre.

Remarks on the trials.

Before proceeding further it is due to the other gentlemen who submitted arms to remark that, either previous or subsequent to sending in their barrels, many of them expressed an opinion that the time allowed was insufficient to enable them thoroughly to work out the difficult question submitted to them, viz., that of procuring good shooting from systems adapted to breech loaders, which had shown excellent qualities when applied to muzzle loaders, and that Mr. Westley Richards, in his answer to the circular letter of the 9th March 1868, did not anticipate that good shooting could be obtained under the conditions therein laid down. At Messrs. Lancaster and Rigby's request letters giving their opinion on this matter are annexed (*vide* Appendices VI. and VII., page 76.)

On the other hand it should be remembered that all these gentlemen had equal opportunities with Mr. Henry for investigating and working out the subject, and that his success is due, not to any sudden discovery, but to the attention he has long given to the production of breech-loading rifles adapted for metallic cartridges.

During the first competition *vide* Report No. 4,905, 12th February 1868, the Henry rifle had shown many excellent qualities, marred only by occasional strip shots, which were probably the results of fouling. These defects Mr. Henry has now completely remedied by improvements in his ammunition. He has substituted pure beeswax for a combination of beeswax and tallow, and a bullet hardened with tin for one of pure lead. The rifles from which this ammunition was fired were similar in system to those sent in during the first competition, excepting that they had nine in place of seven grooves, but Mr. Henry considered that the shooting was little if at all affected by this change, and his assertion was borne out by the good results obtained from the seven-grooved rifles with the improved ammunition.

Remarks on the ammunition fired from the Henry arm.

It remains now to point out clearly in what degree Mr. Henry is entitled to credit for the production of this ammunition and what are its peculiar advantages.

The cartridge case.

The cartridge case, manufactured at the Royal Laboratory and furnished to Mr. Henry in common with the other gentlemen who submitted arms, is similar to that in use in the service and known as the Boxer case. During the long trials of this case, when used with heavy powder charges, its good qualities became plainly apparent, and it proved itself equally suitableto a ·45-inch bore as to a ·577-inch bore. There were very few missfires, and the cartridge cases seldom if ever cut unless placed in rifles the chambering of which was unsuitable. The strength of its construction prevented any defect from its necessarily increased length.

The lubrication.

The lubrication in respect to composition was obligatory, pure beeswax being insisted upon as best adapted for military ammunition, *vide* Mr. Abel's evidence, Appendix I., page 64. The method of applying it in the form of a wad between jute card wads in rear of the bullet is due to Mr. Henry, as is also the shape and composition of the bullet.

The bullet.

It is possible that some, if not all, of these appliances and methods may have been separately employed by others before Mr. Henry, but the Committee cannot forbear remarking that the successful combination is undoubtedly due to him, and that had he not brought it to their notice they would probably at the present time have been unable to recommend the adoption of a ·45-inch bore, the advantages of which are so prominently shown by the numerous experiments here recorded.

The ammunition, when received.

The improved ammunition was submitted to the Committee as early as March 1868, with a request from Mr. Henry that its component parts should be kept secret, excepting from the Royal Laboratory, where the ammunition with which the experiments were conducted was generally made.

Advantages of the Henry ammunition.

The advantages pertaining to this ammunition were four, viz., accuracy, non-fouling, simplicity in form of bullet, and great penetrating power of the bullet.

The first, accuracy, is in part dependent upon the second, and partly upon the form of bullet and system of rifling.

The non-fouling appears to be principally due to the method of applying the lubrication and to the employment of a paper wrapper round the bullet, but the use of a

particular powder, Curtis and Harvey, No. 6, also contributes to this important qualification.

The simplicity of the form of the bullet facilitates its manufacture, and the absence of cavities contributes to its penetrating power, but this latter is also due to the hardness of the bullet and its small diameter as compared with the Snider Enfield bullets of 0·5-inch and 0·577-inch diameter.

The power of penetration.

The penetrating power of the Henry bullet from the ·45-inch bore became so obvious from preliminary trials, that it was decided to make experiments on various substances, in comparison with the bullets from the ·5 and ·577-inch bores.

These were accordingly made and a summary of the results is given, with a more detailed account, in the Appendix VIII., page 77.

PENETRATION TRIALS OF THE HENRY ·45-INCH, THE ·5-INCH, AND ·577-INCH BORES.

When fired through ½-inch elm planks, placed 1 inch apart :—

The Henry ·45-inch hardened bullets made an average penetration of 14½ elm planks.
The ·5-inch Snider hollow lead bullet, 8½ do.
The ·577 do. hollow lead and wood bullet, 8½ do.

Through balks of timber.

When fired through 3-inch balks of dry fir timber, placed close together, at 50 yards distance, the ·5 and ·577-inch Snider bullets were stopped by the second balk The Henry ·45-inch bullet penetrated three balks easily.

At 100 yards distance the Henry bullet also penetrated three balks easily, and a fourth balk of green fir having been added, making in all 12 inches of wood, two out of three bullets penetrated. Thus, whilst two balks of timber at 50 yards distance were proof against bullets from the ·5-inch and ·577-inch bores, four balks of timber at 100 yards distance were not proof against the Henry bullet from the ·45-inch bore.

Through iron plates.

When fired against an iron plate ·261 inch in thickness :—

The ·577-inch penetrated at 75 yards distance, but did not penetrate at 100 yards distance.
The ·5-inch penetrated at 100 yards distance, but not at 150 yards.
The Henry ·45-inch penetrated at 200 yards, but not at 300 yards.

When fired at iron plates ·125-inch thick, placed 1½ inch apart :—

The ·577 and ·5-inch failed to penetrate at 300 yards.
The Henry ·45-inch penetrated at 500 yards.

Through a rope mantlet.

When fired at a rope mantlet (four thicknesses of 3-inch rope) :—

The ·577-inch failed to penetrate at 50 yards distance.
The ·5-inch penetrated at 50 yards but failed to do so at 100 yards.
The Henry ·45-inch penetrated at 350 yards, but failed to do so at 400 yards.

It may be remarked that in two instances pieces of the ·5-inch bullet penetrated at 200 and at 250 yards distance.

Through a gabion.

When fired at an ordinary gabion filled with earth from a clay soil :—

The ·577 and ·5 inch failed to penetrate.
The Henry ·45-inch penetrated at 10 and 25 yards, but failed at the longer distances.
The Jones' (iron band) gabion was proof against all.

Through a sap roller.

When fired at a sap roller :—

The ·577 and ·5 inch failed to penetrate.
The Henry ·45-inch penetrated at 10 yards and at 25 yards, but failed at the longer distances.

Through sandbags.

When fired at a sand bag containing one bushel of sand :—

The ·577 and ·5 inch failed to penetrate.
The Henry ·45-inch penetrated at 10 yards and at 100 yards.

Nature of wounds inflicted.

Experiments were also made to discover the nature of wounds inflicted on an animal. A horse was killed, and immediately afterwards bullets from the ·45, ·5, and ·577-inch bores were fired into his carcass.

The details are given in Appendix VIII., page 77, together with a report from Veterinary Surgeon Harrison, R.H.A., Appendix IX., page 78, who was present during the experiments. It was remarked that the bullets from the Henry ·45-inch bore produced the most severe fractures, the bullets from the ·5 and ·577-inch being more disposed to flatten and to traverse the soft tissues adjoining the bones.

The Henry ·45-inch bullet penetrated in one instance the body of the horse, making a large wound on exit.

The conclusion arrived at from this experiment was, that the ·45-inch bore hardened bullets produced even more severe wounds than the 5· or ·577-inch bullets.

Comparison between Henry ·45, ·5 inch and ·577 Snider-Enfields.

Having now shown the results of the experiments in respect to accuracy, trajectory, and penetration, and having already determined that the Henry barrel with the ammunition submitted with it was the most perfect type of the ·45-inch bore brought under the notice of the Committee, it remains to point out the advantages of this arm as compared with those of the Snider-Enfield of the ·5 and ·577-inch bores.

Facts to be borne in mind during the comparison.

When instituting this comparison, it should be borne in mind that the ammunition and barrel must not be separated.

From the experiments made and the experience gained up to the present time it may be assumed that with the object of attaining good results in shooting, the ammunition submitted with the Henry ·45-inch and Snider-Enfields ·5 and ·577-inch was of the description most suitable for these systems, and must be taken with its advantages and defects.

Instances given.

For instance, to obtain the necessary charges of powder and lead, a long cartridge case is (at the present time) necessary for a ·45-inch bore. Whilst, to obtain accuracy without undue weight, the hollow bullets are preferable to the solid for the ·577 and ·5 inch bores.

Summary of advantages and disadvantages of the three bores.

Having drawn attention to these points, a summary of the advantages and disadvantages of the three systems, *i.e.*, the Henry ·45-inch and the Snider-Enfields ·5 and ·577-inch, is given.

Accuracy.

1. In respect to accuracy, the Henry ·45-inch showed a marked superiority over the 0·5-inch when fired simultaneously with it, and from experiments made at different times by the Committee and from evidence received, it showed a still more marked superiority over the ·577-inch bore, especially at the longer ranges.

Trajectory.

2. To ascertain the trajectories, when fired from the shoulder, of the Henry ·45-inch bore, the Snider ·5-inch, and the Snider ·577-inch, two groups of five shots each were made by two careful shots from each rifle at 500, 400, 300, 200, and 100 yards ranges with the 500-yards sight (the elevation for that range having been carefully ascertained). Aim was taken always at the same point on the target, and the means of the heights of the points of mean impact of these groups at each range above those of the groups at 500 yards gave the heights of the ordinates at each distance; these are plotted out, and the curve connecting them is considered the true trajectory of each rifle.

A diagram showing the trajectories of the three rifles is given, *vide* Plate IV. The advantages of the Henry ·45-inch bore will be seen from the following table.

	Safe distance for Cavalry.	Safe distance for Infantry.	Greatest height of trajectory.
			Feet.
Snider ·577-inch - -	Between 138 and 400 yards -	Between 92 and 438 yards -	11·9
Enfield ·5 „ - -	Between 221 and 325 yards -	Between 123 and 406 yards -	8·9
Henry ·45 „ - -	Nil - - - -	Between 139 and 396 yards -	8·1

Allowance for wind.

3. In respect to allowance for wind the advantage lay greatly with the ·45-inch bore. It has been already reported, *vide* Report, No. 4905, 12th February 1868, that during a high wind across the 1,000 yards range it was observed that "while the Snider rifles (·577-" inch bores) struck 40 to 50 feet, the Henry rifles struck from 20 to 25 feet to the right " of the point aimed at." During the more recent trials the Henry ·45-inch was fired simultaneously with the ·5-inch, with results as shown in the following table:—

Comparison between Henry ·45-inch and Snider-Enfield ·5-inch.

Description of Arm.	Range.	Wind.	Allowance for wind.	Difference in favour of the ·45-in.
	Yards.		Feet.	Feet.
Henry ·45 inch - -	500	Fresh across range.	1·39	5·61
Snider ·5 „ - -	500		7· 0	
Henry ·45 „ - -	800	Fresh, but not much across the range.	0·93	6·71
Snider ·5 „ - -	800		7·64	
Henry ·45 „ - -	1,000	Fresh across range.	13·97	14·57
Snider ·5 „ - -	1,000		28·53	

The advantage thus shown as belonging to the Henry ·45-inch although principally due to the shape of the bullet in relation to its weight, which enables it to retain its velocity in a higher degree than the bullets of the Snider ·5 and ·577-inch, is also partially to be accounted for by the greater initial velocity of the bullet from the ·45-inch bore Henry, as is shown by the following table:—

Nature of Arm.	No. of rounds.	Charge and nature of powder.	Projectile, nature and mean weight.	Mean observed velocity of five shots, at 82 feet.	Calculated mean initial velocity.
				Feet.	Feet.
Henry ·45-inch - -	5	85 grains Curtis & Harvey's No. 6.	Henry bullet, 480 grains.	1316·6	1362·7
Snider ·5-inch - -	5	80 Curtis & Harvey's No. 6.	Boxer bullet, 440 grains.	1283·9	1342·7
Service Snider ·577-inch -	5	70 Rifle F.G. -	Do., 480 grains -	1191·9	1252·8

Fouling. 4. In respect to fouling. There was little or no fouling observed in either the ·45-inch, ·5-inch, or ·577-inch bores after firing (on different days and with different degrees of temperature) upwards of 100 rounds each without cleaning out the rifles.

Penetration. 5. In respect to penetration. The results of the trials (already given) showed a marked superiority of the ·45-inch bore over the ·5-inch, and a superiority, although not so marked, of the ·5-inch over the ·577-inch, whilst the experiments in respect to wounds inflicted made it apparent that the ·45-inch bore was even more deadly and produced more serious injuries than the ·5 and ·577-inch bores.

Form of cartridge. 6. In respect to form of cartridge the advantage lay with the larger bores; their respective lengths being

·45-inch bore - - - -	3″·75
·5 „ „ - - - -	3″·29
·577 „ „ - - - -	2″·45

In strength, estimated not by the results of firing but by rough usage, the longer cartridge appears slightly inferior to those of the ·5-inch, and that again inferior to the ·577-inch, but all these cartridges are sufficiently strong for the requirements of the service.

Measurement and weight of ammunition. 7. In respect to cubic measurements and weight of ammunition packed for service, the following table will show how nearly equal the three descriptions of ammunition are:

CUBIC MEASUREMENTS and WEIGHT of one packet containing 10 rounds of ammunition, packed as for service.

	Measurement. Cubic Inches.	Weight. lbs. ozs. drs.
·45-inch bore - -	11·481 - -	- 1 0 8
·5 „ „ - -	11·725 - -	- 15 7
·577 „ „ - -	11·583 - -	- 1 0 13

Compressed powder suitable for ·5-inch. It is, however, fair to state that the experiments made with compressed powder charges (*vide* p. xxx. Compressed Powder Report) showed that the ·5-inch bore was adapted to this description of powder, and that therefore, if compressed powder were used, the respective lengths and cubic measurements of the cartridges of the ·5-inch bore could be reduced.

Superiority of the ·45 bore Henry. Having carefully considered the advantages and disadvantages of the ·45, ·5, and ·577-inch bores, the Committee decided that the Henry ·45-inch bore was best adapted to the requirements of the service. Its superiority in point of

Accuracy,
Trajectory,
Allowance for wind, and
Penetration

appeared to them to counterbalance the other conditions in which it was, in some degree, excelled by the ·5 and ·577-inch bores, especially as they believed that, with care and attention, some means might be discovered of remedying the slight disadvantage pertaining to the ·45-inch bore, viz., the length of cartridge.

Incidental experiments. Connected with the trials to determine the best shooting barrel there were many incidental experiments, which although necessitating considerable time to carry out may be briefly alluded to.

Method of fastening the bullets into cases. The method of fastening the Henry bullets into the cartridges required consideration. When submitted first by Mr. Henry they were fastened into their cases sufficiently tight

for all ordinary purposes, but, inasmuch as when ammunition is carried loose in the soldier's pouch there is great wear and tear, and a tendency in the bullets to shake out of the cartridge cases, it was thought better that they should be secured in their cases somewhat more firmly. This was first done by Mr. Henry by means of a slight cannelure in the bullet formed by choking it into the case after the cartridge had been made up, but subsequently Colonel Boxer, R.A., Superintendent Royal Laboratories, made some bullets of the Henry pattern with one cannelure cut in the ordinary manner.

Experiments were made to ascertain whether the accuracy of the shooting had been affected, and it was found that such had not been the case, but that the rifle showed equal accuracy with bullets either with or without a cannelure.

Cast and compressed bullets.

The question of cast and compressed bullets also occupied the attention of the Committee and necessitated experiments. Cast bullets had been originally submitted by Mr. Henry and good results had been obtained, but as compression is considered at the Royal Laboratory to be a better method for manufacturing bullets in large quantities than casting, experiments were made to discover whether any change would thereby be effected in the accuracy of the shooting. Cast and compressed bullets were therefore fired simultaneously from Henry barrels, and the results, as regarded accuracy and non-fouling, were equally good.

Powder Curtis and Harvey and F.G.R.

The description of powder likewise required consideration. All the gentlemen who submitted ·45-inch bore rifles employed the Curtis and Harvey's powder No. 6 (of which the superiority for small-bore rifles is attested in the report of the Ordnance Select Committee, of which Brigadier-General St. George was then President, *vide* Appendix II. page 68).

On inquiry of Colonel Younghusband, R.A., Superintendent of the Royal Gunpowder Manufactory at Waltham Abbey, it was found that this description of powder was more expensive to manufacture than the present service powder. Experiments were therefore carried out to ascertain whether the present service powder was equally suitable to the Henry ·45-inch bore.

Many targets were made, and the results obtained proved that, although the present service powder produced fair shooting and evinced but little tendency to foul, yet the Curtis and Harvey's No. 6 showed better results in both these particulars.

It was also remarked that the cartridges made up with the service powder were slightly longer than those made up with the Curtis and Harvey's No. 6.

Letter to Col. Younghusband on Curtis and Harvey's powder.

These advantages in the Curtis and Harvey's No. 6 powder were communicated to Colonel Younghusband, who, in a letter (Appendix X., page 78), recommended that further and more extended trials should be made with powder of a description similar to Curtis and Harvey's No. 6, but manufactured at the Royal Gunpowder Manufactory. These trials have not yet been completed owing to want of time.

Experiments with short barrel.

Experiments were made to ascertain whether a diminution in the length of barrel would affect its shooting. The length of barrel fixed in the circular letter of the 9th March 1868 had reference to the total length of arm, which the War Office advertisement 22/10/66 laid down as obligatory for a military weapon, and was based upon the length of the Henry barrel submitted for the first competition. Thus the total length of the arm with short stock was 51 inches, and the total length of barrel 35 inches. As, however, the arms served out to serjeants are shorter than those of the rank and file, trials of shooting were made from a barrel shortened to 31 inches, and the results in respect to accuracy and non-fouling were as good as those from the longer barrel.

Experiments with enlarged chamber.

A communication was received from Colonel Boxer, R.A., Superintendent Royal Laboratories, to the effect that, "taking into account the necessary limit of manufacture "both in the gun (Henry ·45-inch) and ammunition, it will be necessary to increase the "diameter of the top of the chamber of the ·45-inch bore rifle by seven thousandths of an "inch, in order to admit of easy loading under all circumstances when the Henry bullet "is used."

In consequence of this communication the chambers of several of the Henry barrels were enlarged, and comparative experiments for accuracy of shooting were made between them and the barrels whose chambers remained unaltered. The results of many trials showed that the accuracy of shooting had not deteriorated from the enlargement of the chamber.

The Henry barrel suitable for the requirements of the service.

In every respect as regards shooting the Henry barrel had proved itself suitable to the requirements of the service. There remained only the questions of durability and expense of manufacture. The former, viz., the durability of the rifling may possibly be affected by long continued shooting, but is more liable to show deterioration by incessant and careless cleaning and polishing.

Its durability.

From the results of the experiments, which involved the firing of upwards of 2,080 rounds from the same barrel, and from evidence received that as many as 30,000 rounds

had been fired from a barrel which showed no indications of wear, it was clear that the Henry system of rifling was sufficiently strong to resist any effects from mere shooting.

In regard to cleaning it is evident that a long course of scrubbing and polishing must wear out any barrel, especially if steel ramrods without any protection be employed, but after an examination of the Henry rifling in comparison with the others submitted for trial, and after a careful consideration of the statements made by Mr. Henry, the Committee are of opinion that the Henry rifling is better calculated to resist wear and tear than the Enfield, which in a ·45-inch bore gave the second best results in respect to accuracy.

The method of cleaning the barrel.

It may be a question whether some better method of cleaning barrels than that at present in use may not be invented, as it must be a matter of regret if a really good and accurately shooting arm should be injured by excessive cleaning, as was the case with the muzzle-loading Enfield.

Its cost.

With reference to the cost of rifling barrels on the Henry system, the Committee received much conflicting evidence. Estimates (*vide* Appendices XIII. and XIV., pages 79 and 80) were submitted by Colonel Dixon, R.A., and Mr. Henry, and from this and other evidence they have received, the Committee are of opinion that the Henry system of rifling will not be found to be more expensive in manufacture than many others. The Henry rifles may be made (as before mentioned) with either seven or nine grooves, and owing to there being two cuts less in the former than in the latter the cost of manufacture may be somewhat less. As, however, the cuts in the seven-grooved are deeper than those in the nine-grooved rifles, the diminution of cost will not be considerable.

Opinion on the Henry barrel.

In regard to both durability and cost of manufacture the Committee are of opinion that the Henry barrels are adapted for military purposes, and having already reported that in other respects they appeared superior to the several systems of rifling brought before their notice, the Committee are of opinion that the Henry barrel, ·45-inch bore, is that most suitable in all respects for the requirements of the service.

CONCLUSION.

Steps taken to combine the Martini breech mechanism and Henry barrel.

The Committee having made separate experiments to determine the breech mechanism and barrel best suited to the requirements of the service, and having decided that the Martini breech mechanism and the Henry barrel with the ammunition submitted by Mr. Henry fulfilled most satisfactorily the necessary conditions, requested Colonel Dixon, R.A., Superintendent Royal Small Arms Factories, Enfield, to construct four arms, of which the breech mechanisms were to be made under the supervision of Mr. Martini, and the barrels under that of Mr. Henry. The breech mechanisms and barrels were consequently manufactured at Enfield, excepting the rifling of the latter, which was done by Mr. Henry.

The barrel whether to be nine or seven grooved.

With regard to the barrel, the Committee had made their more recent trials with Mr. Henry's nine-grooved rifle, but as Mr. Henry informed them that the shooting of his seven-grooved was equal to that of his nine-grooved barrels, that in power of endurance they were possibly superior, and that the cost of their manufacture would be probably less, it was decided that two out of the four barrels should be rifled with seven grooves, and two with nine grooves. A request was at the same time sent to Colonel Dixon, that

Sights of the new rifles.

he would fix on the new rifles sights similar to those known as the "Whitworth" sights. On a barrel of 35 inches in length, the back sight ought to be 7 inches from the breech-end of barrel, and 2 feet 2·5 inches from fore sight; the open space in the flat of this description of back sight is considerably wider, and the V shallower than in the present sight of the long Snider rifle: the Committee are of opinion that this alteration will enable the firer to take quicker and more accurate aim, especially in bad light, than with the present service sight.

The arms received.

Two of these arms were received by the Committee about the beginning of January 1869, and the two others at a somewhat later date. In breech mechanism they were similar in pattern to the last Martini arm with which experiments had been made, excepting that arm No. 2 was fitted with a slightly different safety-bolt, and No. 4 with an improved indicator. The barrels were of the Henry pattern.

Mr. Martini and Mr. Henry inspect the arms.

Mr. Martini inspected and expressed himself satisfied with the breech mechanisms, and Mr. Henry inspected the barrels, and having rectified a slight error in their chambering, expressed himself satisfied.

The arms tried for accuracy.

The arms were fitted into fixed rests, and comparative experiments for accuracy were made between the seven and the nine grooved barrels at the several ranges, viz., 300, 500, 800, 1,000, and 1,200 yards.* Their trajectories up to 500 yards were also tested, by

* The Committee were partly induced to make trials of the arms at 1,200 yards from information they received that field artillery could open upon infantry with shrapnel at this range, and they were desirous (per contra) of ascertaining what effect rifles would probably have on artillery.

firing them in the manner described at page 19, and it was found that the trajectory of the seven-grooved was slightly lower than that of the nine-grooved rifles.

A summary of the results of the shooting is given, and the details will be found in Appendix XV., page 81.

SUMMARY of the Results of Shooting of the Henry Barrels.

Henry barrel.	Mean deviations, being averages of five Targets of 20 shots each from each Barrel.		Corrected Angle.	The best of the five Targets of each Rifle at each Range.

Experiments made with the 380-grain bullet.

Experiments were also made with a lighter bullet of 380 grains, with the object of ascertaining whether the trajectory at the shorter ranges might not be lowered, and the ammunition lightened, without occasioning deterioration in accuracy of shooting. From these experiments it became apparent—

1st. That the accuracy of the 380-grain bullet was not equal to that of the 480-grain bullet, even at the comparatively short ranges of 300 and 400 yards, whilst at the longer ranges, the difference in favor of the 480-grain bullet was of course much more clearly marked.

2nd. That the highest point of the trajectory at 300 yards, of the 380-grain bullet, was only seven inches lower than that of the 480-grain bullet, viz. 2 feet (380-grain) against 2 feet 7 inches (480-grain), and at 500 yards was about one foot lower, viz. $7\frac{1}{2}$ feet (380-grain) against $8\frac{1}{4}$ feet (480-grain). In power of penetration the advantage lay with the 480-grain bullet, which penetrated 23 half-inch elm planks, whilst the 380-grain bullet penetrated 17·3 similar planks.

Advantages and disadvantages of a 380-grain bullet.

Thus, the advantages in favor of the 380-grain bullet were a slightly flatter trajectory at the shorter ranges, and a diminution of exactly one pound in the weight of 70 rounds of ammunition.

Against these advantages were to be placed—

1st. The greater accuracy of the 480-grain bullet;

2nd. Its greater penetrative power.

And if two weights of bullets were used, one for short and the other for long ranges, there would be the disadvantages attending the employment of two descriptions of ammunition, and a double sighting on the rifles.

The Committee recommend the 480-grain bullet and the seven-grooved rifle.

The Committee, after considering the results of the experiments, recommend the 480-grain bullet as best adapted for the requirements of the service. They also recommend the seven-grooved barrel in preference to the nine-grooved. In accuracy the two barrels appear about equal. In flatness of trajectory the advantage lies slightly with the seven-grooved barrel, owing probably to the diminution of friction consequent on the bullet bearing on 14 in place of 18 points.

In durability and cheapness of manufacture the advantage appears to lie with the seven-grooved rifles.

Proof of durability of rifling.

With regard to the rifling, a proof was afforded that continued firing had no appreciable effect on its durability. The seven-grooved rifle (Martini's breech mechanism and Henry barrel), which had already been fired for accuracy, was again tested after the firing of upwards 3,000 rounds, and no deterioration was observed.

The breech mechanism.

The system of breech mechanism had been so frequently tested (as has been already detailed in the former portion of the Report) that the Committee were satisfied with firing several hundred rounds to try its general serviceability and power of endurance. Upwards of 3,000 rounds were fired from No. 1 arm (Martini breech mechanism, Henry barrel), and the breech mechanism worked as well at the end of the firing as it did at the commencement. After firing 2,100 rounds the several parts were tested by gauges, and were not found to have given way or to show any symptoms of wear. The breech mechanism was submitted to the examination of practical mechanics, who expressed their opinion that the construction and fitting of the several parts were mechanically correct.

Inspected by practical mechanics.

A drawing of a section of the breech mechanism is given in Plate VI.

Fouling observed to enter breech mechanism but no injury accrues.

During the trials it was observed that fouling was liable to force itself into the breech action, if the cap of the cartridge should give way or the cartridge burst. But the working of the breech action was in no way impeded by the fouling. It appeared also from the trials, and from evidence received from Mr. Abel, Chemist to the War Department (*vide* Appendix XVI., page 81), that the fouling from gunpowder is a protection against rust, and therefore exerts no injurious effects on the mechanism.

The bolt.

It will be noticed that there is no half-cock position in the Martini system, but to allow the arm to be carried with safety when loaded and ready to be fired, a locking bolt, which prevents the trigger from being pulled, has been added to Mr. Martini's original pattern. This plan the Committee consider preferable both in regard to safety and certainty of working to the half-cock in those systems employing a side lock.

The indicator.

The only weak point that became apparent was the indicator, the spring of which broke. In place of this Mr. Martini has substituted in arm No. 4 a new indicator forming part of the tumbler pin, which cannot get out of order, and is equally efficient for showing when the main spring is compressed. By this arrangement there is a saving of three pieces in the mechanism (*vide* Plate V.)

Opinion on the breech mechanism.

From the results of the many experiments they have made, and from the evidence they have received, the Committee are confirmed in their opinion that the Martini system is the best adapted for military purposes of any that have been brought before them. It is safe, strong, simple of construction and of manipulation, and capable of great rapidity of firing, as is evidenced by the fact that 20 rounds were fired from it by Captain Mackinnon in 48 seconds. The Committee, having by these trials satisfied themselves that the combination of the Martini breech mechanism, with the Henry barrel, had not caused any deterioration in respect to efficiency of either breech or barrel, and having already reported that the Martini breech mechanism and the Henry barrel were each separately the best of the several systems which had been brought under their notice, are of opinion that the arm combining these two systems is that best adapted for the requirements of the service. The arm appears to the Committee to surpass in nearly every particular the standard fixed by the War Office advertisement, 22.10.66., and to be a weapon thoroughly suitable for all military purposes. In accuracy of shooting, flatness of trajectory, power of penetration, strength of barrel, safety, simplicity, and rapidity of manipulation, it excels the present service arm. The recoil appears about the same as that of the muzzle-loading Enfield. The cost of manufacture, as taken from the estimate received from Colonel Dixon, R.A., Superintendent Royal Small Arms Factories, shews that the arm can be made with steel barrel and bayonet for 2*l.* 18*s.* 9*d.**

Opinion on the whole arm.

The ammunition.

The ammunition which combines the case similar to that in use in the service, and known as the "Boxer" case, and Mr. Henry's combination of lubricating wad and bullet, the last of a peculiar form and hardened with tin, appears in all respects suitable for military purposes. With regard to the cost of this ammunition, an estimate from Colonel Boxer, R.A., Superintendent Royal Laboratory, is given (*vide* Appendix XVII., page 82).

By this estimate it appears that the ammunition used for the ·45 inch bore costs at present 4*l.* 7*s.* 5*d.*, whilst that for the ·577 inch bore costs 3*l.* 2*s.* 0*d.* per 1,000 rounds. The increased expense of the former is due to the description of powder employed, and to the doubt whether the process now used in the manufacture of the present service bullet of pure lead would be applicable to a hardened bullet. Both these difficulties the

* The Committee have learnt from Colonel Dixon, R.A., that the price of the new Service Snider Enfield ·577-inch bore, with steel barrel and bayonet, is 2*l.* 13*s.* 2*d.* They have reason to believe, from information they have received, that the cost of the Martini-Henry arm will be diminished when experience is gained in its manufacture. They would also point out that the barrel of the Martini-Henry arm is stronger than that of the new Service arm.

Committee believe will be overcome. They have made trials with satisfactory results of a powder manufactured at the Government factory, which can be made for about the same cost as the present service powder, and would therefore reduce the estimate by 11*s.* 1*d.*, whilst they confidently hope that Colonel Boxer will devise a method for manufacturing the Henry bullet as cheaply as by that at present in use. They would point out also that the use of a solid bullet will render unnecessary the labour and machinery for hollowing the bullets as well as for making the clay plugs and fixing them in the present service bullet.

Conclusion.

Referring to paragraph V. of War Office advertisement 22.10.66, viz., "that the "Secretary of State will take care that no ingenious novelty produced in answer to this "advertisement shall be adopted into the service without proper acknowledgment, and "that the name of the individual with whom it originates should be recorded in connec- "tion with it," the Committee are of opinion that in the event of the arm and ammunition recommended being adopted into the service, the arm should be called the "Martini-Henry," and that the name of "Henry" should be added to that of "Boxer," which at present stands on the service ammunition, and the ammunition should be called the "Boxer-Henry." They are also of opinion that Mr. Martini should receive a reward for his breech mechanism, and Mr. Henry for his barrel and ammunition.

REPORT ON REPEATING ARMS.

(With reference to W. O. Letter 21.3.67 and Report No. 4636 of 4th July 1867.)

Repeating arms before the Committee.

The Committee have the honour to forward their report on the repeating arms which have been brought under their notice.

They had before them the

Ball and Lamson.
*Henry.
Larsen.
Spencer.
Vertelli.
Winchester.

Of these the Winchester and Vertelli were submitted at a late period of the inquiry, the latter at the special request of the Committee. For the Larsen arm no ammunition was supplied, and it appeared open to objections similar to those observed in the single loader of the same name and maker, one of which was blown open. (See Appendix III. page 69.)

Trials of repeating arms.

These arms, with the exception of the Larsen, were subjected to trials somewhat similar to those which were imposed on the breech mechanisms of single loaders. A few shots were also usually fired for accuracy, in order to prove the suitability of the cartridges in that respect for a military arm.

The following is a short description of the

Ball and Lamson,
Spencer,
Henry arms, and ammunition.

ARMS.

Ball and Lamson.

The magazine is a tube in the woodwork of the stock under the barrel, capable of containing eight or nine copper rim fire cartridges, which are constantly pressed towards the breech action by means of a long spiral spring. This supply can be shut off and the arm used as a single loader.

The breech is closed by a block swung backward and forward by means of a lever which forms the trigger guard; the cartridge is fired by a hammer driven by a common side lock, which strikes an exposed portion of the rim.

The face of the block is cut to the shape of the cartridge and its rim, and thus holds the cartridge, which (supplied either from the magazine or placed in it by hand when the action is open) rides in the block; on drawing back the lever the block is swung forward, the cartridge lodged in the chamber, and the breech closed; on moving forward the lever the block is swung back (drawing with it the empty shell, which is flipped to one side by a spring released by this motion), and laid opposite the magazine, from which it can receive a fresh cartridge. Length of arm 3 feet 1 inch.

Spencer repeating rifle.

The magazine is a metal tube in the stock capable of holding seven copper rim fire cartridges pressed against the action by means of a spiral spring:

The cartridge is exploded by a loose piston struck by the hammer of a common side lock The breech is closed by a block swung backwards and forwards by means of a lever which forms the trigger guard.

On pushing forward the lever, the block is swung back, the breech opened, the empty cartridge case withdrawn and ejected by being made to travel over a guide, and a cartridge from the magazine allowed to pass in front of that part of the block which contains the striker and which closes the breech, and is retained there between a part of the block and the guide. In drawing back the lever into its place the block is swung forward, pushing the new cartridge into the chamber, and after bringing the hammer to full cock, the gun is ready to be fired.

Length of arm, 3 feet 6½ inches.

* This is not the Mr. Henry referred to in the previous Report.

The magazine is a tube under the barrel capable of containing 15 drawn copper rim fire cartridges, which are constantly pressed by means of a long spiral spring into the tray or feeder which supplies the chamber. Henry repeating rifle.

The breech is closed by a sliding bolt, consisting of three main pieces; it closes the breech, conveys the blow of the hammer to the cartridge and carries the extractor. The action is worked by a long lever, forming the trigger guard and terminating in a handle; on moving forward this lever the bolt is withdrawn, the gun cocked, the empty cartridge case extracted, the tray holding a cartridge from the magazine raised opposite the chamber, and the empty case lifted out; on drawing back the lever into its place the bolt is moved forward (pushing before it into the chamber the cartridge) and the tray is lowered, when the magazine spring deposits another cartridge in it, the gun is then ready to be fired; the hammer can be placed at full cock, independent of the lever.

Length of arm, 3 feet 7 inches.

AMMUNITION.

Name.	Description of Cartridge.	Length.	Weight.	Description of Bullet.	Length.	Diameter.	Weight.	Powder.
		ins.	grs.		ins.	ins.	grs.	grs.
Winchester	Drawn copper, in two pieces, the powder case fitting into a base cup, which has a rim for extraction, central fire, the fulminate held between base of cup and a perforated metal disc.	1·99	500	Pure lead, solid cylindro-conoidal, 4 cannelures, portion in case slightly smaller in diameter.	·82	·46	320	50
Henry -	Drawn copper case, Rim-fire.	1·34	326	Pure lead, solid cylindro-conoidal, point flattened, 4 cannelures, lubrication apparently wax.	·72	·44	255	23
Spencer -	Drawn copper case, Rim-fire.	1·6	480	Pure lead, solid cylindro-conoidal, two cannelures, wax lubrication.	·82	·5	350	46
Ball and Lamson.	Drawn copper case, Rim-fire.	1·66	477	Pure lead, cylindro-conoidal, two cannelures, solid, compound lubrication, chiefly tallow, apparently.	·86	·5	350	50

TRIALS.

The following comparative trials were made of the three systems:— Trials.

Two targets of 20 shots each from shoulder rest were made from each of the three arms at the 500 yards range. The results were as follows:— Accuracy.

——	Mean Deviation.	
	1st Target.	2nd Target.
	Ft.	Ft.
Ball and Lamson - -	3·66	1·83
Spencer - - -	2·65	2·07
Henry - - -	2·53	4·62

The trials for rapidity were as follows:—

The Ball and Lamson magazine containing eight cartridges was loaded and the magazine emptied five times, giving a total of 40 shots fired in 2 minutes and 52 seconds. It was then fired as a single loader without using the magazine at the rate of 20 shots in 1 minute and 15 seconds. Rapidity Ball and Lamson.

Spencer. The Spencer magazine containing seven cartridges was loaded and the magazine emptied twice, giving a total of 14 shots, in 1 minute 33 seconds. The cartridges then jammed in the magazine while refilling it, so that the stopper could not be forced home. The trial was discontinued.

Henry. The Henry magazine containing 15 cartridges was loaded and the magazine emptied three times, giving a total of 45 shots, in 1 minute 36 seconds.

Sand Trials.

The arms were then put through the sand trials in the usual manner, sand being thrown over the breech actions both open and closed and the arms fired.

The results were as follows:—

Ball and Lamson. The Ball and Lamson stood the test well, although there was some little difficulty in firing the last three shots.

Spencer. The Spencer worked stiffly. Three shots were fired with great difficulty, and the rifle became unserviceable.

Henry. The Henry stood the test very well, and worked satisfactorily.

Decision on the three systems. After a careful consideration of the results of these trials, and an examination of the breech arrangements of the three arms, the Committee decided that the Henry system was on the whole most suitable for a military weapon. But they were also of opinion that a repeating arm, in order to be adapted for the requirements of the service, should be capable of being employed as a single loader, the magazine being kept in reserve for use in case of need.

Communication made with the Winchester Rifle Company. Having understood that this improvement had been embodied in the Winchester rifle, which was on the same principle as the Henry repeating arm, the Committee communicated with the Winchester Repeating Arms Company, in America, requesting them to furnish two specimen arms with suitable ammunition.

Arm received. One of these arms was received about the middle of October 1868. It was similar in construction to that previously described as the Henry, but contained the improvement already alluded to, viz., the capability of being used either as a single loader or a repeater. It was also more suitable for an infantry weapon in point of length and ammunition.

Description of the arm. The following is a description of this arm in those points in which it differs from the Henry already described:

Length from bottom of butt to muzzle	49⅛ inches
Weight without bayonet	8lbs. 12½ oz.
Length of barrel	29¾ inches
Calibre	·45 inch
Number of cartridges in magazine	12
Number of cartridges to one pound	About 14.

The magazine is loaded at the end nearest the breech in place of the end nearest the muzzle, and the arm can be used either as a single loader or a repeater.

Experiments are made. Experiments similar to those to which the other repeating arms were subjected were made with this arm.

Accuracy. Two targets of 20 shots each were made at the 500 yards range from shoulder rest with mean deviations of

1·46 feet,
1·45 feet,

and one target of 20 shots was made at the 800 yards range with a mean deviation of 3·66 feet.

Rapidity. When used as a single loader 20 shots were fired in 1 minute 4 seconds. When used as a magazine arm, 25 shots were fired in 1 minute 18 seconds. The time occupied was—

Loading	25 seconds
Firing twice	28 „
Loading	25 „
Total	1′ 18″

Sand trial. There was some difficulty in making this trial, as the lever which opens the breech had been made too weak and became bent and unserviceable.

It was also found that if sand were thrown over the breech mechanism when closed there was some difficulty in working it. If thrown over it when open, the parts became completely jammed, and the arm consequently unserviceable.

The Vertelli arm received.

About this time a Swiss repeater, named the Vertelli arm, was submitted privately to the Committee.

It contained in the magazine 15 rounds and could also be used as a single loader.

The Winchester arm preferred.

After examination and trial, it was decided that the Winchester repeater was simpler in construction and better adapted to the purposes of a military weapon than the Vertelli, and that it was the most favourable specimen of a repeater that had yet been brought before the notice of the Committee.

Decision on repeating arms.

Notwithstanding, the Committee are not prepared to recommend a repeater for general adoption into the service.

The mechanism of the Winchester is more complicated than that of the Martini and many other single loaders; it is also more liable to injury, and not so well calculated to resist the wear and tear of service.

The principle of closing the breech by means of a bolt is open to the objections already urged against bolt guns in the report on the breech mechanisms of single loaders, *vide* page 10.

For general use by infantry, the weight of the arm when the magazine is loaded is objectionable.

With regard to rapidity of fire, that of the Martini and other single loaders is so great that, except under very exceptional circumstances, nothing further in this respect can be desired.

There may, however, be occasions when a repeating arm might be useful, and if such should be the opinion of the military authorities, the Committee recommend that the Winchester arm should be taken as being the best that has been brought before their notice, and that it be strengthened and otherwise modified to render it more suitable as a military arm.

EDWARD ROSS.

Royal Arsenal, Woolwich,
Feb. 11, 1869.

REPORT ON COMPRESSED POWDER.

The subject first brought before the Committee.

The Committee were first led to the consideration of the subject of cartridges made up with compressed powder by Colonel Boxer, Superintendent Royal Laboratories, who informed them, in January 1868, that from the results of the comparatively few trials he had made he was of opinion that compressed powder would answer well in breech-loading rifles if manufactured in the manner he described, viz., by making a cavity in the centre of the charge, to allow of sufficiently rapid ignition.

The advantages of using compressed powder were at once evident, especially if the ·45-inch bore should be adopted, as the length of the cartridge case would be reduced, and the ammunition would consequently be more portable and better adapted to some systems of breech mechanism.

Additional evidence obtained.

The attention of the Committee having been directed to the subject, they obtained additional evidence from Colonel Boxer, R.A., Capt. Noble, R.A., and Mr. Abel, chemist to the War Department, which is given in Appendix I., pages 39, 59, 66.

Barrels ordered.

This evidence appeared so satisfactory that it was thought desirable to request each of the gentlemen who were preparing barrels for the accuracy trials to put in hand four additional barrels, in order to make comparative experiments of the compressed powder cartridges from their several systems of rifling.

Barrels not to be chambered.

As, however, it was necessary to ascertain the relative strengths of the compressed and loose power, in order to lay down the proper charge with which to make these experiments, and as its ultimate success was still doubtful, it was resolved that the barrels should not be chambered until the Committee had decided on these points. This was the more necessary as the length of cartridge case, influencing the length of chamber, depended on the amount of powder charge.

Trials to be made from a ·45 bore.

At the time when the question of compressed powder was brought before the Committee, they had decided that the experiments for accuracy should be made from a ·45-inch bore. It was therefore requisite to make trial of the compressed powder from that bore.

The Henry ·45 bore.

The Committee had before them the Henry ·45-inch bore, which had given fairly good results during the first competitive trials, but of which the shooting was greatly marred by occasional strip shots.

Mr. Henry sends in improved ammunition.

Whilst they were considering the question of making experiments with the compressed powder, Mr. Henry submitted to them some improved ammunition, which he requested might be tried from his rifles sent in for the first competitive trials. The improvement principally consisted in the substitution of pure beeswax as a lubricant in place of beeswax and tallow, and of a bullet hardened with tin in place of one of pure lead.

The chambers of the Henry rifles shortened.

The results of trials made with this ammunition were so good that it was determined (with the sanction of Mr. Henry) to shorten the chambers of two of his competitive rifles, and with ammunition made up in a similar manner, excepting in respect to the powder, to conduct the necessary experiments with the compressed charges, the aim being to arrive at conclusions which would justify the Committee in laying down the amount of powder charge, in order that the gentlemen who were preparing barrels might be enabled to chamber them and carry out separately their own experiments, before submitting the barrels for the Committee's trials.

The object of the proposed trials.

Experiments made from the ·45, the ·5 inch and the ·577 bores.

This was accordingly done, and comparative experiments were made between Mr. Henry's ·45-inch bore adapted for compressed powder and a similar barrel adapted for loose powder. At the same time, and in consequence of a favourable report received from Colonels Dixon and Boxer, experiments under similar conditions were made between ·5-inch barrels manufactured at Enfield.

Questions to be decided.

The questions to be decided were :—

1st. The description of powder best adapted for compression.

2nd. The method and degree of compression.

3rd. The comparative strength of compressed and loose powder charges, and consequently the size of the pellets.

With the assistance of Colonel Boxer, R.A., Superintendent Royal Laboratories, and Captain Noble, R.A., a long series of experiments was carried out to determine these points. They were commenced in May 1868, about the time of the sending out of the circular letter to the gentlemen who were preparing barrels for accuracy, and were not terminated until October.

The experiments when carried on.

The first question to be decided was the description of powder best suited for compression.

First question to be decided.

In this the Committee were guided by information obtained from Colonel Boxer, which was subsequently borne out by their own experiments, the conclusion being, that the F.G. powder gave better results when compressed than either the F.G.R. or the Curtis and Harvey No. 6.

F. G. powder gives better results than F. G. R. or Curtis and Harvey.

With regard to the method of compression, it was found from experiments, of which the details are given in Appendix XVIII., page 82, that the original method of compression was the best, viz., in one pellet with pressure applied at one end of the pellet, so that its densest portion should be next the cap, and the lightest portion next the bullet; the perforation being in the dense end and the indentation in the light end.

Method of compression.

With regard to the comparative strength of compressed and loose powder, the results of the experiments with ·45 and ·5 inch bores were at variance with the evidence received, which was probably based on previous trials made with the ·577-inch bore, *vide* Appendix XVIII., page 85.

The strength of compressed powder.

It had been supposed that the strength of the compressed F.G. powder was greater than that of Curtis and Harvey's loose powder, the same weight being used; but from the experiments made by Captain Noble, R.A., to determine the initial velocity of bullets, it was found that from a Henry ·45-inch bore a charge of 86 grains of compressed F.G. powder was required to give equal results to those obtained from a charge of 85 grains loose powder, Curtis and Harvey's No. 6, and from the ·5-inch bore Snider that the charge of 75 grains compressed F.G. powder did not give equal velocity to 80 grains loose powder F.G.R., the description of powder used with that arm.

Furthermore it appeared that the relative strength of compressed powder diminished in a small bore as the charge was increased, and consequently lengthened.

The results of these trials for velocity, together with many interesting details, are given in Appendix XVIII.

In conjunction with these trials, experiments for accuracy were made from the ·5-inch barrels manufactured at Enfield and from the Henry ·45-inch bore barrels, the object in view being (as before stated) to fix the charge so that the gentlemen preparing barrels should be in a position to conduct their own trials. The results of the experiments with the ·5-inch bore showed that equally good results could be obtained from compressed as from loose powder, and that the cartridge could be shortened by half an inch.

Experiments for accuracy.

Results from a ·5-inch bore.

The trials with compressed powder from the ·45-inch bore, although not so satisfactory, seemed to warrant the Committee in fixing the charge of compressed powder at 86 grains, and a letter was accordingly sent, on the 24th June 1868, to the several gentlemen preparing barrels, informing them of the results already obtained, and requesting them to continue the experiments. At the same time an offer was made to supply cartridge cases with compressed powder charges from the Royal Laboratory. It was further suggested that, should any variations in the charges be thought desirable, the Committee should be informed, so that the views of the gentlemen who were preparing barrels might be carried out. A letter was also sent to Colonel Boxer, R.A., requesting him to continue the experiments with compressed powder from a ·45-inch bore, and inform the Committee of the result.

From a ·45 bore.

The charge fixed and letter sent to gentlemen preparing barrels.

Letter sent to Col. Boxer, R.A.

Many of the gentlemen preparing barrels applied for a supply of compressed powder cartridges, and Mr. Henry in particular devoted much time and care in conducting experiments before submitting his barrels on the same system of rifling as those for loose powder, but chambered for the compressed powder cartridges.

Applications made for cartridges.

The Committee regret to state that the results of the experiments, including those made by Colonel Boxer, were not satisfactory. The accuracy and regularity of shooting from a ·45-inch bore with compressed powder charges were not equal to those obtained from loose powder charges, *vide* Appendix XVIII., page 85, nor was the reduction in the length of the cartridge case, which was only half an inch, a sufficient gain to compensate for the deterioration of the shooting.

The results of the trials not satisfactory.

The Committee therefore decided that, with their present knowledge of compressed powder, they could not recommend its adoption into the service for cartridges for a ·45-inch bore. At the same time they consider that some improvement in the present powder might possibly be made by which the length and bulk of the cartridge would be reduced.

Decision on compressed powder for a ·45 bore.

Assistance received from Mr. Henry.

The Committee desire also to point out the assistance which they received from Mr. Henry in carrying out their experiments with compressed powder. The good shooting of his rifles with loose powder enabled them to make trial of compressed powder from a ·45-inch bore by shortening the chambers of his barrels, whilst the early preparation by Mr. Henry of his rifles, in response to the Committee's letter of the 9th March 1868, enabled him to conduct many experiments with compressed powder at the expense of much time and labour, the results of which he communicated to the Committee. Therefore, although the experiments already made have not led to the desired result, the Committee feel that they are none the less indebted to Mr. Henry for his assistance.

APPENDIX.

APPENDIX I.

MINUTES OF EVIDENCE TAKEN BEFORE THE COMMITTEE ON BREECH-LOADING RIFLES.

War Office, Thursday, 6th February 1868.

PRESENT:

LIEUT.-COLONEL H. C. FLETCHER, SCOTS FUSILIER GUARDS, IN THE CHAIR.

CAPTAIN J. RAWLINS, 48th Regiment.
CAPTAIN W. C. MACKINNON, 3rd Regiment.
EARL SPENCER, K.G.
E. ROSS, ESQ.
CAPTAIN R. W. HAIG, Royal Artillery, Secretary.

Lieut.-General CHARLES HAY examined.

Lieut.-Gen. C. Hay.

6 Feb. 1868.

1. (*Chairman.*) As Inspector General of Musketry, your attention has been a good deal directed to the question of rifles for some years past?—Yes, for about 13 years.

2. The Committee wish to know what you consider to be the principal requisites for a military arm, more especially with reference to the trajectory and accuracy in firing, and how they bear upon each other?—I consider that one of the essential points for the mass of the troops is to have a flat trajectory, and as flat as you can get it—it is a question really of judging distance.

3. Do you conceive that a flat trajectory is even of greater importance than extreme accuracy in firing?—Yes, at short distances. Decidedly, you must have a certain amount of accuracy; but I should waive much of that at short distances for the purpose of having a flat trajectory for the mass of the men, and when I speak of short distances I mean up to 400 or 500 yards.

4. With regard to the best weight for a military arm, do you consider the present weight, 9 lbs. 8 ozs., a good weight?—I think you may maintain that if you give a better material. If weight is to constitute strength, decidedly our present arm is not strong enough, I consider it is lamentably weak.

5. In what parts do you consider it is weak?—Particularly as you come up to the muzzle, within about 18 inches of the muzzle it is too thin, because there it is scooped out. I have known men in going to the right-about at the slope dent the rifle, and the rifle is then not worth sixpence, it is too weak decidedly. I may say that I recommended many years ago that three inches should be cut off and added to the weight. I do not like increasing the weight if you can compensate it. I have written three or four times about that, taking off about three inches and putting it into the weight of the rifle, I believe that you need not increase the weight.

6. In your opinion it is too weak, not only as a shooting arm, but too weak for service?—Yes, it is too weak for service; it is destroyed in common marching work that men would have to go through in campaigning, and then of course the shooting would be destroyed.

7. Do you think that weakness would be avoided by having a steel barrel?—Yes, to a great extent.

8. With regard to the length of the barrel, supposing that a shorter barrel, say 3 feet long, should be found equally good for shooting, do you see any objection to it?—I cannot conceive any objection. I have recommended over and over again a 3-feet barrel, and many officers with whom I have conversed upon the subject have admitted that a shorter arm would answer all the purpose.

9. Would there be no danger of accident from the muzzles of the guns in the hands of the rear rank men not clearing the front rank?—There might be a trifling risk in that with muzzle-loaders, but certainly not with a breech-loader, because the ranks do not come to the present at the same time; there was perhaps a chance of injuring the front rank men, but still a very remote one, if the men were properly drilled; now that is obviated by the breech loader, because the men are never up to present at the same time.

10. Supposing the weight of the rifle, apportioned in the best way to be 9 lbs. 8 ozs., what, in your opinion, is the best bore for a military rifle?—That is a question which I conceive is to be settled entirely by the weight of the bullet you intend to fire—you must first deal with the weight of lead; 13 years ago one of our first mechanics, Mr. Whitworth, settled the question theoretically by the ·451 bore for a given weight of lead, that is 530 grains, and the theory then propounded by him has been proved, by 12 or 13 years' practical experience, to be right. If the ·451 bore was the right thing for 530 grains of lead, I think it is quite clear that if you reduced the weight of lead you should in the same ratio reduce your bore, unless you choose to do what they have done with the Snider, and sacrifice penetration by putting wood into the bullet instead of lead. You must say what quantity of lead you will fire, that is the point—you must settle that before you settle the bore.

Lieut.-Gen. C. Hay.

6 Feb. 1868.

11. Is there any advantage for military purposes in having a bullet of 530 grains of lead?—Not the least in the world; the idea was entertained some nine years ago, when they got hold of some story about the late Duke of Wellington to this effect, that you could not break a horse's leg with anything under a certain weight, and I being a very strong advocate for a small bore, tried every experiment that I could to meet the opposition that I met with, and among other experiments I tried the effect of a small bore bullet against the thigh bones and shin bones of men. I fired at them from a distance of about 80 yards. I put them up enclosed in canvas, and I fired at them to see what this small-bore bullet would do, and I found that it completely shattered the bone. On one or two occasions a thigh bone was so shattered by a shot, that if it had not been for the canvas holding it up the lower part would have fallen away from the upper part, and, what is more, the bullet, after shattering the bone, went through eight or nine planks that were behind it.

12. Was that a solid or a hollow bullet?—It was a solid bullet, and the weight of it was 530 grains. The idea entertained was that these small-bore bullets would not shatter, and I wanted to show that it was weight and velocity that did the work.

13. Would a lighter bullet be equally serviceable?—Yes. I have not the slightest doubt that 450 grains would do more than you could desire to do.

14. Was it a hardened bullet?—Yes, it was a hardened bullet.

15. In order to get some guide as to the bore, you say that it is better first to fix the weight of the bullet; what weight of bullet would you recommend?—By the light of our present experience, I should say that a bullet for the mass of the troops should not exceed about 440 or 450 grains, but I should wish for a bullet for long-range shooting that would weigh 500, and not less than 500 grains for long-range shooting. If the Committee will allow me, I will read a short extract from the report that I made in 1862 in answer to some observations by the Select Committee. This is the remark that I made: "I am quite alive to the "great inconvenience different ammunition must en- "tail. For these reasons, while I consider it indis- "pensable that all 'marksmen' should be armed with "the best possible rifle, it appears to me that no "pains should be spared to render possible the "adoption of a rifle of one uniform bore, such as "while it would enable the mass of our infantry to "maintain rapid and accurate shooting with a very "low trajectory to 500 or 600 yards, would at the "same time by a slight change in the ammunition "enable the 'marksmen' to command accurate shoot- "ing at 1,100 and 1,200 yards." That was the evidence given in 1862, and I entertain the same opinion now, and indeed I am more confirmed in that opinion than ever.

16. You think there is no objection to two ammunitions?—Not the slightest. If a man had to use ammunition of two kinds he would have perhaps 10 rounds of one and 80 rounds of the other; the only possible effect would be that he would be firing a little too well; he would be able to load just as easily, and he would be firing with the mass of the men at 300 yards, only with superior ammunition if it happened that he ran out of his 80 rounds of common ammunition.

17. If you had a bullet for the mass of the troops, to weigh 450 grains, and for the marksman 500 grains, do you think that would be sufficient?—If I was obliged to fix a standard I should not put it at more than 440 grains and 500 grains.

18. You would fix the bore with reference to the weight of the bullet, upon what weight would you fix the bore?—I certainly should not go beyond ·451, but rather below that. I should make that my maximum most decidedly. Mr. Whitworth had the problem to solve of how he should get the best shooting with a given weight of lead, and he settled ·451; he started a turn in 20 inches, and he did get the best shooting with that weight of lead. If Mr Whitworth's theory is sound you must follow that out, and you must reduce your bore even a little more. I believe that ·451 should be considered quite the maximum; I think it is a question whether you should not go below that.

19. That was fixed, I believe, on the supposition that a 530 grain bullet would be used?—Yes, and it was not for years afterwards that they went to 480, not till after our Committee; and one of the reasons given by me in my memorandum was that by adopting the smaller bore in preference to the Enfield bore it enabled you to reduce the weight of the bullet if found necessary.

20. There is another difficulty, is there not, as to having two ammunitions for the same rifle, viz., as to the sighting. I suppose that the sighting would be different?—The Whitworth rifles were double-sighted; but when you consider that up to 300 yards we do not in action use any sight at all, there could not be very much difficulty.

21. If ·451 bore was adopted, what twist, in your opinion, is necessary?—You must have one turn in 20 inches, and a bullet of about 3 diameters in length without weakening it by wood, the penetration of the Snider bullet is more than one plank less than the muzzle loading Enfield, simply because the proper length of bullet must be kept up by adding wood; you must have a three-diameter bullet, and I think you ought to keep that without packing the bullets, that is, not putting wood into them. The penetration of the Snider rifle, firing the same weight of lead, is more than a plank, it is a plank and a half difference, and why is that so? Simply on account of your having to keep up your length by putting in wood.

22. Do you consider that a solid bullet is better than a hollow one?—Yes, decidedly; it is more easily manufactured, and it does its work better.

23. Do you consider that a bullet of pure lead is necessary?—I should harden it, but I think the extent of the hardening is a matter of trial. You cannot harden your bullet beyond a certain point, unless you shallow your groove to such an extent that the rifle would be perfectly useless in a military arm. In some of the match rifles, Rigby's, for instance, they shallow the grooves to such an extent that the rifle would be utterly useless to a soldier.

24. Do you consider that an expanding bullet is necessary? Is it as good as or better than those bullets which are forced into the barrel?—I think so certainly; in my opinion forcing is decidedly wrong, because it is accompanied with a loss of power.

25. It tends to leading the barrel, does it not?—Yes, and it is contrary I think to all principle, forcing the bullet past the lands.

26. When you say that a bullet should not be hollow, it ought, I presume, to be sufficiently so to produce expansion?—You may make it hollow or solid; if you have a long bullet it will expand, where a short bullet without an auxiliary will not—it shuts up. If you found that you could increase the expansion by hollowing it at the base, I think there is no objection to that, it must expand.

27. The new bullet that has been made by Colonel Boxer has not a plug at the end but is almost a hollow bullet?—That I consider most objectionable, because the bullet is so weak. I have no doubt that if you fired that bullet against planks you would find that its penetration would be two planks at least less than the Enfield, and that would be going back. I think you should go forward, instead of which we are going back. With regard to the trajectory, you are losing that, and you are also losing penetration.

28. Do you consider penetration of very great importance in a military bullet?—Yes, and we tried experiments in the Committee that I was upon; we fired through gabions and through fascines. The Whitworth bullet used to whistle through those things, while the others would not go, they stuck in the middle; the penetration of the hardened Whitworth bullet was something like 25 planks *versus* about

12 or 13. I tried an experiment, and found that the velocity of the Whitworth bullet was so great even when it had travelled 800 yards, in comparison with the other, that supposing both bullets were travelling alongside each other, one would go through just about a third more than the other.

29. With regard to the description of rifling that you would recommend, I think you have already stated that it is not advisable to have very shallow rifling?—You cannot have very shallow rifling, because I think the lands would wear out. If the lands get worn by rubbing the rifle becomes a smooth bore.

30. Have you formed any opinion as to which is the best description of rifling?—My experience has been principally with muzzle-loading rifles, and I think there cannot be a shadow of a doubt that the best principle for rifling is Whitworth's. I have gone into that question and have given diagrams of the firing, and have shown why the loading should be as easy after shooting as before. I have given the experiments after the trials and after a great deal of firing.

31. We are now dealing with breech-loaders?—Yes, and I still think that the polygonal rifle is a sound thing. You cannot get over this, that in the one case you are dealing with straight lines instead of curves; you are dealing with planes, while in the other things you are dealing with curves, and that must be, in a mechanical point of view, an advantage.

32. Do you know the Lancaster rifle?—Yes.

33. Is an elliptical bore, opinion in your applicable to military purposes?—I think it is a good military weapon as long as you keep the major diameter considerably larger than the minor, the groove is pretty deep.

34. Have you seen the Lancaster rifle tried as a small bore?—Yes, I have seen the trials, and in all the trials with the small-bores the Lancaster rifle was nowhere. In all the Woolwich trials, and in all the competitive trials for the National Rifle Association, Lancaster retreated and never came there.

35. Was that with a muzzle-loader?—Yes; the beauty of the polygonal rifling is this, that you have no such thing as land, it is all groove, the land is merely just a point in the centre of the flat, it is all groove; the instant the bullet begins to depart from the line in the centre it is in a groove, and it need not go to the bottom of it, and the reason why you could go on loading with that rifle is manifest.

36. Did it not at the same time cause one or two wild shots when the fouling had accumulated very much?—You did not get such good shooting, but you got your rotation, and if it did not expand above half the length of the flats it was still in the grooves. I will explain what I mean; the instant it expanded it did not want to go to that angle (*describing*), but if it expanded half way, it had sufficient rotation to guide it; the system was found good, because it had a maximum rifling surface, and you should have as much of that as you can.

37. The reason why I asked you the question as to occasional wild shots was because it was found that one of the rifles we have been trying would fire very well for a certain time, and then it would not strike the target, and we thought that that might have been occasioned from the fouling having accumulated, and having thrown the shot off before it had cleared the barrel?—I have fired with blank ammunition, and I have reduced the charge so as not to expand the bullet. I have reduced it to 50 grains. I tried to get a strip from it, but I could not shut the rifle up with very inferior ammunition. I believe that the polygonal system has been proved to be sound in the case of the breech-loader. We have the Westley Richards, and as far as the public trials will go to show it, the Westley Richards rifle, I think, has almost kept its own against anything at long ranges; I think it shoots most beautifully at long ranges.

38. With regard to the bullet, do you consider it is better to have paper on the bullet than not?—Not so, if you can get a bullet that will shoot without fouling. If you can do that why should you have the paper?

39. If no paper was used, would you put any lubrication on the bullet?—In the cannelures.

40. Have you formed any opinion as to whether it is best to use paper with lubrication on it, or to place the lubrication on the cannelure of the bullet?—I really do not think it is material, but I should never object to a cartridge because it happened to require paper on bullet. We know that it lasts for an immense time. It was found that there was an acid in the grease, and that used to corrode the bullet in hot climates. I think the lubrication is now well understood. I do not think it is material, but I think in most instances you will find occasional leading without paper, particularly if you go to a small-bore.

41. But that is not of such great consequence with a breech-loader, because it is more easily removed?—No.

42. With regard to the charge of powder, what charge do you consider the best?—If you went so low as a 440-grain bullet I should be inclined to use 70 grains of powder.

43. Suppose we adopted 500 grains, what charge would you recommend?—Then I should add, I think, another 10 grains, and use 80 or 85 grains.

44. Have you seen the new cartridges which are made of compressed powder with an air chamber running up the centre?—Yes, I have tried that powder, and my experience of it went to show that in moderate weather or in warm weather it shot remarkably well, but directly frosty weather came then it fouled the gun.

45. Can you account for that in any way?—I would account for it in this way. There is a certain gum or moisture which is mixed up with it, and I thought that this gum or moisture got to a certain extent frozen; you have to get rid of this damp in some way or other, it quite upset our theory as to the necessity for having the large grained powder, so that the flame might ignite the powder and get to the front of the charge; these were made solid, there were little grains, but they all stuck together, therefore, according to the old theory, where were the interstices for the flame to get through? I found that it shot most magnificently in warm weather, and it was simply this, that the flame was passing outside—it ran forward outside, and then reached the centre from the sides.

46. In the ammunition that is at present made of compressed powder, there is a sort of air chamber which runs up the centre of the cartridge?—It runs up in order to meet the difficulty which I have spoken of, that of having no interstices between the grains; the objection I find to the long air chamber is that it lengthens the column of powder and consequently the cartridge.

47. It might obviate fouling, might it not?—It might do that, but I do not think there is any fault in the ignition, for I got most magnificent shooting with it.

48. There is great advantage in it, if the theory is correct, because the powder is considerably stronger, and therefore a smaller quantity is required?—It is stronger, no doubt, but it must be made in a different way—there must be a different incorporation, and a difference in the materials; there must be, I think, more saltpetre; this is not compressed powder in grains, but it is made in a sort of paste.

49. I believe the grains are preserved?—I have tried the powder very much, and I think Whitworth has tried it; he wanted to use it for field guns. My experience of it was that it was an utter failure in frosty weather, and I did not go on with it.

50. Do you find that there is much more fouling in rifles in frosty weather than in dry weather?—They fire better in summer or in warm weather than in winter, and for this reason, that the lubrication is better, that is to say it is more slippery. I found that

Lieut.-Gen. C. Hay.
6 Feb. 1868.

I had the best shooting when the barrel was so hot that I could hardly hold it.

51. One of the objections to small-bores is that they are liable to foul from continual firing, so as to interfere with their shooting qualities?—I do not think so, unless the ammunition is not properly made. I do not see why you should not go on shooting for ever with them if the ammunition is properly made. I have a report here that I made to a former committee on that head: "After 24 shots with the Whit-" worth rifle No. 132, with 70 grains of powder, ·432 " bullet, from Woolwich (waxed); after firing 440 " rounds without cleaning on different days at a range " of 600 yards, the angle of elevation being 1° 32′;" and the figure 1·12 ft.

52. How were those rounds fired?—From a rest in a gale of wind. I tried the experiment afterwards and I then fired 21 rounds. I fired two rounds of blank just to see the effect. I passed my 21, and then I fired two rounds of blank cartridge. I expected that my bullet would drop, but between 21 and 22 there was only a difference of 3 inches between the two shots; that was pure beeswax. I applied officially and got the bullet reduced and dipped in beeswax at Woolwich.

53. Did you fire any of those rounds with great rapidity between the firings?—Yes, I fired them as fast as I could, some 20 and some 30 a day.

54. Supposing you fired sufficiently fast to heat the gun greatly, do you think that would be likely to injure the shooting?—I think it would rather improve it; but perhaps I am wrong in saying that, for my trials have been more for rapidity of shooting than otherwise, and I have always found the loading to improve the hotter the rifle was; it was more a matter of loading that I went into, but the shooting was all very good.

55. Ought not a gun to stand 100 or 200 rounds fired with great rapidity, and shoot well after those rounds have been fired?—Yes, it ought to shoot well decidedly.

56. Would it tell against a gun if it deteriorated greatly after 100 rounds had been fired with great rapidity. Suppose you began for accuracy first, then fired some rounds quickly, and then began for accuracy again?—If the shooting should be very wild it would of course tell against it. I do not think you could expect the same accuracy of shooting, although, if the ammunition is all right, I do not think it can make much difference. It is entirely a question of ammunition whether the gun fails or not.

57. When you say it is entirely a question of ammunition, what do you mean? I mean that the powder must be good, that the expansion must be all right, the bullet must be of its right length, and the lubrication must be all right. These Snider rifles might be fired I believe any number of rounds without fouling with good ammunition. I have had some of my supplies which were not all right, and the fouling was considerable, even after 10 rounds; indeed so much so after 10 rounds that I could not get the plug in to take the angle. That shows that even with this beautiful Snider ammunition, excellently and wonderfully made as it is, if it is not made with perfect care it fails, even with fresh hands it was better made under the auspices of those who were directing the makers than any manufacturer almost could secure; and all the failures in shooting with the breech-loaders, I am satisfied, supposing everything else to be right, are due to the want of care in making the ammunition, this Colonel Boxer has got over, because he can apply a remedy on the spot; he has advantages, and the result has been a most wonderful cartridge. But I believe that any small-bore cartridge with some pains and expense could be made perfectly good. I am perfectly sure that Colonel Boxer could make you a small-bore cartridge just as good as any other.

58. Is it not the case that the shooting from the same description of breech-loader is worse than the shooting from the same description of muzzle-loader, and that the shooting generally from breech-loaders is rather deteriorated?—I have not found any deterioration in the Snider at all.

59. Is not that because they have improved the ammunition?—Entirely so; at one time I did not know where the shots were going, and the men at the butt did not know where the shots were going, because the shooting was so wild; they were firing at a very high angle.

60. Then the shooting did deteriorate with the Snider?—Dreadfully, when the ammunition was so bad.

61. Was it not the same ammunition in respect to charge and description of powder and shape and weight of bullet that was used with the muzzle-loader?—No.

62. Was it not made as the ammunition was made for the muzzle-loader?—No, it had 50 grains less lead, so that you cannot compare the two ammunitions; but it was made up apparently with the same care as the good ammunition for the Snider.

63. What the Committee desire to know is why breech-loading has made any change, or whether it has made any change in the conditions of good shooting—whether the fact of loading at the breech has influenced good shooting?—I think it has been proved by the Snider, that such has not been the case when ammunition is all right.

64. But that arm requires a different sort of ammunition, does it not?—Of course it does.

65. Why should it require that different sort of ammunition, referring to the form of the bullet, not of course to the cartridge case?—In the first place you have done away with windage; the bullet is ·550 in the muzzle-loader, and in the other it is ·573, the bore being ·577 so that you have hardly any windage with the breech-loader; but in doing that, and keeping the same weight, you shorten the bullet, and increase the diameter; of course you have to gain your end in some other way, and you do it by putting wood in and weakening the bullet. There is no doubt that you are driven to do that entirely by maintaining the bore which is too large.

66. Do you think there is nothing in the principle of breech-loading that should in any way cause the shooting to fall off?—I do not think so; we have wonderfully good shooting with the Westley Richards rifle, if the ammunition is all right.

67. Then it is a question of ammunition, in your opinion?—Entirely so.

68. With regard to the strength of the stock, do you consider that a divided stock, as many of the American rifles are made, is sufficiently strong for military purposes?—The stocking all up offers I think a certain protection to the barrel.

69. Yes, but it is divided into two pieces; there is the stock and then the breech mechanism, and then a piece of wood that is fastened below the barrel?—I would rather have it all in one piece, in this way (*describing by a sketch*), unless you strengthened it with iron across here (*describing*), and connected the two, it should be weak across *there*, and if a man clubbed his rifle he would be very likely to break it right in two here (*pointing to the sketch*)—you may make it as strong I think.

70. Do you think it is necessary for a military rifle that the stocking should extend quite up the barrel, or supposing the barrels were made of steel, would there not be sufficient strength for the bayonet without it?—The muzzle of a rifle must always be comparatively weak, and if you fix a bayonet on it you must have a certain strength—it must not be too long unsupported. I think it is better to take the wood pretty near to the muzzle.

71. With regard to the lock of a military rifle, have you seen any of the locks that are made with a spiral spring, which are apparently much more simple in construction than the present lock?—Yes; I think that our present lock is quite obsolete. The machinery costs about six times as much as it ought to cost. I may mention that my armourer made a lock with a simple main spring. I believe that the lock may be much simplified.

72. You have seen locks made with one spiral spring to do the whole work, do you know of any objection to spiral springs?—May I ask whether the spiral spring is to be enclosed?

73. Yes, and therefore protected from the weather.—I cannot conceive that it would be more liable to injury than the main springs, they go very often, and so will spiral springs go.

74. With regard to the repeating rifles, do you consider that they would be applicable for military purposes?—I think that under certain circumstances they would be, such as for the defence of towns. You might I think issue them for that purpose, but I cannot conceive that a repeating rifle could be made a general weapon for the field.

75. Supposing that a repeating rifle was so made that it could be used with its magazine when required, and used as a simple breech-loader on other occasions, what should you say?—I think that it would add very much to the weight; but with regard to repeating rifles, when you consider that you have rifles that will fire 12 rounds a minute, I think that is repeating pretty fast. I saw one with which 17 rounds were fired in a minute, and now by an alteration that has been made they can fire 21, and I think that is repeating pretty fast. I should think that for the defence of a breach it would be very serviceable, in fact it would be nothing more than the old Palafox mode of defence, having lots of rifles placed ready loaded, so as to keep on firing. These things would answer the same purpose to repel an assault, and each garrison naturally would have them; but I cannot fancy your being able to get as strong a rifle in one of these repeaters without its being very heavy.

76. (*Earl Spencer.*) The Committee understand perfectly well the advantages of a low trajectory, but it may be well for you to state generally why you think it of such importance?—It is a question of judging distance, it covers your errors in judging distance, it is our first catch for cavalry or infantry, and we should have to alter our book upon that subject. We try to give the soldier a rough idea of the flight of his bullet, and as well as we can to give him some idea of the curve, but this would bring it all down; but it is of primary importance, a flat trajectory.

77. Very much the same thing would apply, would it not, to the allowance made for the wind?—Of course it would; any man who shoots with a small-bore without wind gauges will see the advantage of getting on the edge of the target, instead of going five or six feet off it. The highest order of training is getting on your target when aiming a long way off it, and it is an enormous advantage.

78. Do you think it is easy to combine penetration to which you attribute great importance, with a low trajectory and accuracy, at long ranges?—Yes; the rifle that would give you good shooting at 1,000 or 1,200 yards would give you better shooting at 500 or 600 yards. I should be disposed to sacrifice accuracy, if necessary, to a low trajectory for the mass.

79. Have you made any trials to ascertain the smashing power of a bullet, using a lighter ball and a heavier charge of powder?—No; I merely made an experiment with a hardened bullet, the Whitworth.

80. You would get, would you not, very high destructive power with a light bullet and a heavy charge?—Yes; it is the velocity as well as the weight; you have got velocity with the 440-grain bullet—you have not perhaps the weight, but you have the momentum the weight multiplied by the velocity—the velocity has a great deal to do with it.

81. I presume you consider that freedom from fouling is an important requirement in a military arm?—Yes; I think that a gun should go on loading and firing with accuracy, or be so good that it should be easy in all its action, easy to load, and to fire with accuracy after much shooting.

82. Do you attribute the absence of fouling a great deal to lubrication?—Yes, and to the way in which the cartridge is made up. I could not give the Committee a stronger instance of the necessity of making the ammunition properly than this, that after all the experiments were made, and those experiments were made before the Committee which established the Snider, after that was made I had ammunition supplied that fouled so badly that we could not shoot a bit; it was some ammunition which had been imperfectly made up, and if you get bad shooting with that excellent ammunition imperfectly made up, what will you get with ammunition imperfectly made up by inexperienced people?

83. I suppose it is not entirely a question of beeswax and tallow?—It is a matter of lubrication of the bullet.

84. You have stated that you have not found the Whitworth rifle fail to any extent, have you seen the report which was laid before Parliament in 1867 on the trial with troops of the rifle?—No, they did not send it to me at all; I never saw it. I only know that trials were made under my eye. I saw the regiments from Shorncliffe come down and shoot, and I fired with my own people with it, to give it every opportunity. The people from Shorncliffe who came to fire were shocking bad shots, but they admitted in the fouling trial, and I think they fired 200 rounds of rapid firing, that it loaded better after the second day than it did at first.

85. Did you receive satisfactory reports from the regiments that were entirely armed with those rifles?—The reports did not come to me, but I found, as far as I could glean them, that the reports were decidedly in favour of the Whitworth rifle.

86. Do you happen to have seen Major Gordon's report from India, on the subject of the Whitworth rifles issued there?—No, I have only heard of it.

87. Should you consider his opinion a good one?—Yes, I consider him a very first-rate man.

88. A successful trial in India would be of considerable importance in your eyes?—Yes, but that a failure should to a certain extent arise was evident.

89. Have you considered the subject of paper and copper-cased cartridges?—Yes, to a certain extent I have. The Committee are aware that there are two great points in favour of paper; the first is the weight and next the facility of manufacture; for example, if you should be shut up anywhere, I think it advisable—and we always used to teach so many men in a company cartridge making, the recruits were taught cartridge making—10 men in a company were taught cartridge making. At Lucknow, when we were shut up there, our ammunition ran out, and we have it on record that Colonel North happened to get hold of a few serjeant instructors, and he produced I think some 70,000 or 80,000 rounds of ammunition; he got the lead, and they made the cartridges, and if you can get paper, or any other material more simple, I think it is an advantage. Then you have the weight to consider. I do not know what the weight is, but it must be something considerable if a man is to carry 90 rounds; our future supply in the field will be about that, not less than that, therefore it is an advantage I think if you can get a simple cartridge, there is no doubt about it the Snider cartridge is a very strong one.

90. I suppose it would keep longer?—I do not know about that. I think that the keeping quality will be exactly in the ratio of the damp that you shut up, if there is any in the powder, which I believe there always is, and you shut that in. Then it is to be proved whether in four or five years, when you come to look at the powder in the paper, you will find it considerably deteriorated. I think it will be. I know that one of the rules of the Committee to which I have referred was that no ammunition would be taken which did not fulfil all the conditions of this Snider cartridge, and that is a very strong cartridge indeed, but because you may be able to put it under water for a week. I do not think, if there are other great advantages in favour of another cartridge, that it should be condemned, because it will not stay under water for a week; it may be just as good for

Lieut.-Gen. C. Hay.

6 Feb. 1868.

all practical purposes if it would stay under water, say, for 12 hours or 24 hours, or, in short, if it would stand a good ducking

91. Would the Westley Richards cartridge fulfil all the requirements?—I do not know the experiments which have been made—I believe the only time that it has been tried was in India and in New Zealand. I asked him to make it stronger, and he has made the case stronger—the paper is a good deal stronger now.

92. Could it not be made up by the soldiers in case of necessity?—I think they might be trained to make it up, you might pick men out of a company who might be taught to make it up, it certainly could be made up; they would want a punch to punch the wad.

93. Could they not also make up the old copper-cased cartridges?—You would have to put in an anvil and it would be very difficult.

94. We have seen some that could be made up and used again?—Yes; but what I mean to say is this, that I do not see the necessity for keeping your ammunition, or making it a *sine quâ non* that it should remain under water for a week, if it is in other respects strong and serviceable. It is something like making a barrel—you might get a barrel strong enough for your purpose, and then you might say it would be better if it was stronger; but if it is strong enough, I do not see that there is any great advantage in having that extra strength. Referring to the cartridge, it is a very beautiful cartridge, but it is very difficult to make up.

95. Do you think that the breech-loader, with respect to the strength of its breech arrangements, should be independent of the case of the cartridge?—I think you must connect it with the cartridge. I cannot fancy any breech-loader that will shut out all the escape of gas without some assistance from the cartridge.

96. In the case of the paper cartridge assistance is given by means of the wad?—Yes, it answers very nearly the same purpose, the wad, and, I suspect, the disc.

97. If there were an escape of gas, which is the case sometimes with a damaged cartridge, would the breech be safe?—It is very difficult to get any breech that would be safe. If you take a Snider cartridge and make it imperfectly, you will blow the breech right up. I think if you can get strength of breech without an escape of gas it is better, and it is an important point.

98. You would not object to seeing a prize given at Wimbledon to be competed for by the army?—I think it is a grand idea. Why should soldiers not go anywhere if the prizes were open? It would do much good.

99. (*Mr. Ross.*) In the trials that were made for fouling, were the rifles fired rapidly?—The firing was from the Whitworth rest, and rapidly from the shoulder.

100. Is it to be expected that a military arm should fire 100 rounds with excessive rapidity, 12 or 14 shots a minute, and the shooting not be deteriorated?—I think you must expect that it would deteriorate.

101. I am speaking of a breech-loader. I presume you would not expect troops to fire 100 rounds with excessive rapidity, say 12 or 14 shots a minute, and the shooting not deteriorate?—Decidedly not, but it is the dose that you give the enemy in a short time, the first six or seven rounds, that does the business.

102. Suppose that 20 rounds were fired from a rifle rapidly, and then 20 rounds taking aim in the ordinary way, alternately, and that 100 or 150 shots were fired in this way, if at the end of that number of shots the shooting did not deteriorate, should you consider that a sufficient test?—Yes, I should think so certainly. There are two things to consider with regard to fouling. For example, there is a fouling which destroys accuracy of shooting, but which does not destroy the loading. I think that with a soldier's weapon you should be able to load rapidly.

103. When you speak of two kinds of bullets, a heavy one for marksmen at long ranges, and a lighter one for the mass of the troops to shoot with a lower trajectory at a shorter distance, do you propose to lighten the bullet by shortening it or by hollowing it? I think you must keep as near as possible to 3 diameters in length or with as little wood as possible.

104. You would hollow the bullet to obtain lightness?—Yes. I do not know that you would have to hollow it very much if you reduced the bore of rifle.

105. It would be the difference between 530 grains and 480?—Yes, but you must recollect that 530 grains are for ·451, and I am supposing that if you reduce the bore a little below that you would not have to shorten the bullet very much for a 440-grain bullet; ·451 is quite the maximum in the present day—we have come to that in 12 years.

106. (*Captain Mackinnon.*) Do you think that the great strength of the present Government cartridge is so necessary that it ought to be kept up, even with a sacrifice of the conditions of good shooting?—I think that it should not be kept up at a sacrifice of any other points, provided that the ammunition stood a fair test; for instance, if you dipped it in water for 12 hours—I think that if it stood in water for 12 hours it would be practically just as good as if it was in water for a week. I should say that any ducking you might give it, putting it into water and taking it out again, and doing that two or three times for two or three days running, is all that you want for practical purposes.

107. (*Captain Rawlins.*) Would it, in your opinion, be advisable to give explosive shells to any of the troops?—I have tried shells with the greatest advantage, even with the Enfield rifle. I am speaking of the Metford shell. We used to explode our tumbrils at 600 yards, and fancy these things used against cavalry; they will explode against anything, against a saddle or against a horse. I think that nothing but shell should be fired under certain circumstances.

108. Do you think it would be applicable to a small bore?—Of course it would, you get the same quantity of explosive material in length instead of breadth; you have just the same quantity of room, only it is longer.

109. (*Chairman.*) If you used a shell instead of having a wooden plug in front, do you think that a shelled bullet would be better than a solid one?—It would be more destructive against cavalry.

110. And more applicable for military purposes?—Yes, because it tears everything to pieces, and makes a tremendous wound.

111. You think there is no objection to shells?—I cannot see the slightest objection; you load and fire as quickly.

112. (*Mr. Ross.*) It would weaken the penetration of the bullet a little, would it not?—Yes, but the tearing property of the explosive material assists, to a certain extent, the penetration.

113. (*Chairman.*) In order to obtain a good rifle, what do you consider to be the groundwork? Should a perfect barrel or perfect ammunition be first procurred, and should the barrel be fitted to the ammunition, or *vice versâ*?—I think it is more difficult to get the ammunition for the barrel than to get the barrel for the ammunition. I think you should have a gun of sufficient strength to stand wear and tear. First of all it must stand very rough usage, then it must have sufficient weight in the breech to stand a charge of powder of about 80 grains, and it should stand that without any violent recoil.

114. Is it not the case that in the present state of invention the ammunition and the barrel present the greater difficulty, and that it is less easy to obtain them than to get good breech mechanism?—I think it is difficult to get good practical mechanism. I altered an Enfield rifle, and took three inches off it, I lightened guard brass and the heel plate, but leaving them perfectly strong. I found that I got my barrel as nearly to 5 lbs. as possible. I put all that I saved into the weight of the barrel, and I got my gun just

of the same weight as the Enfield rifle, the weight of the barrel being 5 lbs. instead of 4 lb. 4 ozs.

115. (*Earl Spencer.*) I suppose the Enfield rifle is often worn out from ill-usage long before the groovings are?—Yes, long before. In India and in the Crimea the damage done to the arms, if they fell down and were trodden upon, was very great, and they were done for, because the iron was so soft. My idea of a barrel is the one that I had made of 5 lbs. weight, and that enabled me to make it a section of a cone outside, and I could put a straight edge on it; but if you put a straight edge on an Enfield rifle you have too great an arch, the metal has been scooped out, it has been taken off, and I think that it should stand the test of a straightedge from breech to muzzle. If you have that scooping out it no doubt lightens the gun.

116. Do you find the recoil of a small-bore rifle too great for the comfort of the soldier?—Not a bit, and I can give you a very strong case with regard to the recoil. The year before last a lad, a mere stripling, a Scotch boy, won the Queen's prize; he was quite a lad, and was firing for the first time in his life 530 grains of lead with 85 grains of powder, and sitting on his heel. I think that answers the question about the recoil being too much for a soldier. All I ask for is 500 grains of lead and 80 grains of powder for picked men—the *élite* of the corps—the old Peninsular bullet was only an ounce.

117. The argument as to the recoil is very often used against the small bore?—Yes, but there is the proof that I have just given you, that a boy, a mere stripling, is able to fire, sitting on his heel, without inconvenience.

118. Do you wish to make any statement to the Committee with regard to the French arm?—I would say this, that the French having adopted a rifle with a very much flatter trajectory than ours, it behoves us not to let them have such a manifest advantage as that—it would be madness in us to do so.

119. What is the bore in the French arm?—I think it is ·441, and I think they fire 85 grains of powder with 400 grains of lead.

120. (*Chairman.*) You consider, all other things being equal, their arms being in other respects equally good with our own, that we should be under a great disadvantage from the cause you have mentioned?—Yes, they would mow you down if you came within 400 or 500 yards of them, on account of the lowness of their trajectory.

121. (*Mr. Ross.*) In order to attain a low trajectory at 400 or 500 yards must you not sacrifice, to a certain extent, accuracy at long ranges?—Yes, possibly to a certain extent, that is to say, you might not get accuracy quite so great at 1,000 yards. I should be inclined to keep up about 3 diameter in length of bullet.

122. (*Earl Spencer.*) Is this correct with regard to the Chassepot, that the bullet is made of 393 grains of lead, and it is fired with 86 grains of powder?—I daresay it is, and, as I have before said they would mow you down.

The witness withdrew.

Mr. Charles William Lancaster examined.

123. (*Chairman.*) I believe you have turned your attention to the subject of military arms?—I have for many years.

124. One of the great requisites for a military arm, we conceive, is a low trajectory and accuracy combined; in order to obtain a low trajectory and accuracy combined, what conditions do you consider to be the most essential?—As limited an area of bore as is consistent with military purposes, and as large a charge of powder as it is possible to use with that limited area of bore. Those are the conditions of a low trajectory.

125. And of accuracy?—Yes, the one follows the other.

126. Although you may, by increasing the initial velocity, get a very low trajectory, yet you may fall off in accuracy, may you not?—I do not conceive that that is possible. I think that in rifle shooting the very fact of having a high velocity, assuming the fact to be so, will also give you, if the other conditions are equal, proper rifling and proper twists, increased accuracy, and certainly a greater per-centage of hits. That, I presume, is the object of this Committee, to get the highest number of hits, in a military point of view, at all given distances.

127. Is it not the case that a comparatively light bullet with a heavy charge of powder will create a low trajectory, whereas a heavier bullet will be better for accuracy at long distances?—There is no question about this, that there are certain limits; it does not do to have a long bullet made very light by means of too extensive an excavation. If the cavity for the powder is so great as to render the bullet too light, you would have very great inaccuracies at very long ranges, although you would have a very high initial velocity at short ranges. If you were to hollow out the ball too much, so as to reduce the specific gravity of it, and made it a light ball, when it had passed a certain number of yards the bullet would rapidly lose a large proportion of its initial velocity, or a greater proportion of it than if the ball had been solid, and therefore of greater density—that is well understood. If you take any object, whatever force you exert, you cannot propel it to long ranges without you have a certain specific gravity, therefore the specific gravity of the ball relatively to its length and diameter would be co-efficient, and they would bear upon one another strictly relatively.

128. What would you consider to be the best weight of bullet?—That would entirely depend upon the calibre; you must first define the calibre.

129. To obtain a low trajectory combined with accuracy, what calibre, in your opinion, would be the best?—As a military weapon, I think that the ·500 or $\frac{1}{2}$-inch bore would be as good as any, either that or the ·450, but that is of little consequence. I think that for all military purposes you could not have a better bore than the ·500.

130. Why is the ·500 better than the ·450?—A slightly larger bore renders it more easily cleaned, and it is less liable to damage in passing a steel ramrod down.

131. I am speaking now with regard to breech-loaders?—Yes, you must clean them out; the smaller the bore practically the greater the difficulty in keeping it clean.

132. That would not apply, I suppose, so much to breech-loaders as to muzzle-loaders?—No; but another question also comes in view, as you diminish the calibre; assuming that you retain a high charge of powder as a condition precedent, you also increase the length of the cartridge, without you adopt something analogous to that which the Americans have been trying with considerable success, that of having the cartridge considerably larger in its posterior portion, in this form (*explaining by a sketch*); of course this is very much exaggerated, but I believe myself, in reference to the question of breech-loading arms, that the very first condition which the Committee should consider and decide is the question of the cartridge.

133. You consider that the foundation?—Yes, absolutely, everything follows on that; first settle the cartridge and decide what is the best cartridge, then 20 men can give you guns to suit that cartridge perfectly, assuming it to be a metallic cartridge, you cannot go from that, first decide upon the cartridge and then the gun. It is the work of Tantalus to make the gun and the cartridge, it assumes endless complications, and has cost this country I may say hundreds of thousands of pounds in the prior consideration of arms, in not settling the cartridge first.

134. Then the cartridge being the most important

Mr. C. W. Lancaster.

6 Feb. 1868.

thing, will you be kind enough to state to the Committee what you consider to be the best description of cartridge for breech-loading arms?—My decided impression is that you cannot move from the position of a metallic cartridge, that I believe is a condition absolute for all military arms; whether it may be the very excellent cartridge of Colonel Boxer, or whether it may be a brass cartridge stamped up in one piece, the same as is used by the Americans, is a question for the Committee to try and decide. I think it would be exceedingly difficult to produce a better cartridge than Colonel Boxer's for military purposes, but that is a question which resolves itself into a careful series of trials and deductions. I am not aware of what course the Committee has taken, in reference to the trial of arms or of cartridges, it is merely as a matter of principle that I entertain the strong opinion which I now express to the Committee.

135. Have you seen the cartridges which are now made with compressed powder?—Yes, I have, Colonel Boxer has shown them to me.

136. Have you any opinion to express as to them?—I cannot possibly pronounce an opinion, as I have never seen any trial made; as a matter of convenience the shortening of the cartridge is a great object, but what may be the result of practice with them I cannot say.

137. Would it not to a certain degree obviate one of the difficulties which exist with reference to a smaller bore than the half-inch, namely, that you can get a shorter cartridge by using compressed powder?—That is the object, to get the cartridge as short as possible.

138. If you could shorten the cartridge, is there any objection to ·451 bore?—None whatever, if you can get a short cartridge, and I think the cartridges which I have seen have been limited to 70 grains of powder. I think that I should prefer a larger charge with a small bore; 70 grains of powder even with ·451 bore is not, according to my opinion, a sufficient charge to be used for the model arm, such as ought to be produced by this Government.

139. What do you consider should be the weight of the bullet, and the charge of powder for the ·451 bore?—I think, speaking of course according to the light of my past experience, that the bullet ought to weigh about 500 grains as nearly as possible; 500 grains would make a very nice bullet indeed, assuming it to be a solid one, or a moderate shell-bullet, or an explosive bullet, and in a breech-loading barrel it is decidedly not necessary to have it hollow in the rear; that is to say, in the preparation of the Snider ammunition Colonel Boxer was tied down to hard conditions, he had to obtain a light bullet with a comparatively large bore, therefore he was compelled to have a wood plug in front and in the rear; but with the ·451 bore, or with the ·500 bore, there are no such conditions necessary.

140. Can you produce an expansion without a cavity in the rear?—There is no expansion necessary in a breech-loader, it is all forcing.

141. How do you do away with windage?—By forcing. In the breech-loader you have very important elements in reference to accuracy in shooting. I will assume that these two lines (*explaining by a sketch*) represent the interior of the barrel, irrespective of all question of rifling, and the ·450 bore, and I will assume this (*pointing to the sketch*) to represent the chamber. Now extreme care and nicety are required to ensure good shooting, between the size of this chamber and the size of the barrel, because whatever the diameter of your bore may be, it is upset by the blow of the powder, and is really fitted to the diameter of that chamber; therefore if this chamber (*pointing to the same*) is too large, and you put the ball into the barrel, or force it in with what is technically termed too much slug upon it, the column of lead is too large for the bore; too much is done by the barrel rifling in forcing it through, and one of the consequences is that you get very inaccurate shooting. It is generally attributed to fouling, that is the general impression; but it really in almost every instance is due to the excessive work put on the lead in passing through the barrel, from the ball being made too large in that chamber.

142. Still you consider that, supposing the chamber to be accurately made, forcing is a better principle than expansion?—It is never-failing.

143. Do you lose any initial velocity by forcing, from there being so much more friction?—Not if the proportion of work done is right. You would lose initial velocity if too much work was done, but not if you have the requisite amount of work. What is termed expansion is not really expansion, it is the upsetting of the column of lead when struck by the powder. In an ordinary muzzle-loader it is commonly called expansion, but it really means this, that you take a column of lead and put it in the barrel, and you strike the rear end of that column of lead with the powder at a velocity of so many feet per second—say 1,000 feet per second; that practically amounts to a blow on the rear end of the lead. Now, as lead does not transmit motion very readily, less than any metal, you have actually set the rear end ot that ball in motion before motion has been communicated to the front; and this being still in rest, the pressure of this hinder portion of the ball causes the centre to expand and to swell out and fit the barrel. It is really upsetting; and it is a question between that in the one case, or the forcing of that lead which is first upset into the size of the chamber, and into the barrel. The question resolves itself into this—in one case in a muzzle-loader you upset the bullet directly into the rifle, and in the other you upset the bullet in the chamber, and you introduce it into the rifling. Hence the extreme nicety with which the chamber should be regulated as to the bore and the barrel.

144. Will you state what charge of powder you consider would be the most suitable?—I should feel inclined to use about 85 grains.

145. And the bullet of about 500 grains?—Yes, of course all this would be a matter for careful consideration, but these are about the elements; the Committee will find them as nearly correct as possible.

146. That is with a bore of ·450?—Yes, or ·500.

147. Having fixed the cartridge, what form of barrel do you consider best, and what rifling, and what twist?—I need scarcely mention that I still retain the conviction that the oval bore, which I have for 18 years persistently carried out, will be ultimately the most advisable for military purposes; but, being the inventor of it, I should rather not express an opinion, as it is so strictly a personal matter. I would rather leave it to the Committee's own trials, for I prefer not to speak of what I have done myself.

148. As you have tried it, perhaps you can state what the advantages of it are?—Putting it in that courteous way, if regard is had to the reports made by four or five committees, one after the other, in which the oval bore has constantly and persistently shown superior shooting over all and every kind of rifling, and which the public statistics as to questions of rifling have sufficiently established, I think I may say that there is no question, all things being equal, that the oval bore does give superiority of shooting. The last Special Committee, which sat in 1862, published a series of very elaborate reports, and under every condition of service, with wax lubrication, and the shooting of the oval bore arms at all ranges gave greatly superior shooting—as compared with the Enfield more than 80 per cent., and as compared with the 5-groove rifle from 50 to 60 per cent. better shooting.

149. Have you tried them with the ·451 bore?—That was part of the public trial to which I alluded. The tables are appended to the report, and it will be seen that at all ranges, from 300 yards to 1,200 yards, the oval bore rifles beat consecutively the Enfield, the 5-groove, and the Whitworth rifle, with wax lubrications.

150. The arms were, of course, muzzle-loaders?—Yes.

151. Do you find that the shooting has deteriorated at all since the muzzle-loaders have been converted into breech-loaders?—The official reports state that the first carbines which were converted to the Snider plan for the Royal Corps of Engineers, and sent down to the Select Committee for trial, gave superior shooting, both to the 5-groove and the 3-groove rifles. If I am right, I think that the figure of merit of these arms was made the standard of shooting for other arms of the same calibre.

152. Do you consider that the system of breech-loading at all tends to deteriorate the shooting?—All things being equal, assuming your cartridge is correct, I think the shooting of the breech-loader is quite as good as that of the muzzle-loader.

153. You do not mean that it is so with similar cartridges?—No; everything depends in a breech-loader upon the accuracy of the cartridge, the accuracy of the proportion of the ball, and the accuracy with which the chamber is cut relative to the diameter of the ball. If you have too large a ball in the cartridge, and too large a chamber to receive the bullet, you then put too much work on the rifling, and it is a rather more complicated question. Then with the muzzle-loader you have your rifling, and the ball is expanded, and it has not to fulfil a double duty, first to be expanded into the chamber, and then to enter into the rifling.

154. You think that the steps to be taken to obtain a perfect rifle are first to settle the cartridge, then the barrel, and then the breech mechanism?—Those are the conditions, and if I may repeat them, when once you have settled your cartridge, there are three or four or six plans almost as good as one another as to the mechanical arrangement of the breech-loading; there is very little difference between several modes.

155. Do you prefer a purely leaden bullet or a hardened bullet?—That depends upon what purpose you require it for; is it for penetration?

156. Yes.—If you require great penetration, I am not clear that it is necessary for military arms, but if you require great penetration, then there is a great advantage in having a hardened bullet, but you do it at the price of recoil.

157. Why is there greater recoil from a hardened bullet than from another?—You will see it quite clearly; if you have to force soft lead through the rifling, which you do in a breech-loader, it is on the proposition that the recoil will be measured by the friction between the area of the rifling and the side of the bullet. If you put in a steel ball which is slightly larger than the bore what would be the result? You would have a most tremendous recoil, and you would burst up all the breech-loading arrangement, and very likely burst the barrel.

158. By hardening the bullet you must inevitably increase the recoil; is it not also more difficult to upset the bullet when it is hardened than when it is soft?—It is forcing it through the rifling; there is no upsetting in the breech-loading arrangement; you force it through the rifling, it has to go the length of this chamber first (*explaining*); if it was soft lead it would first expand it into this chamber, if it was hard lead it would enter from that chamber (*explaining*) into the rifling, cutting its way through the rifling, and of course the friction on the inside of the barrel would be in proportion to the metal.

159. As to twist, I believe you have adopted an increasing twist?—Yes.

160. On what principle have you done that?—If you have to start a bullet from a state of rest, and the rifling of the barrel proceeds in a helical direction round the barrel, by starting the bullet at once in this pitch of one turn in 20 inches, suddenly into that one turn in 20 inches, which you would do if it was a regular spiral, you are more likely to have a proportion fail to fill up the rifling than you would have where the rifling starts from a very low proportion of twist—assuming it to start in a straight line, and go on progressively to half a turn, or to start at a quarter of a turn and go on to a whole one.

161. The same reasoning would not apply, I presume, if you forced the bullet, instead of its being expanded?—Yes, it would; but I confess this, that even with a regular spiral you can obtain excellent shooting in either way, so long as you have spiral enough.

Mr. C. W. Lancaster.

6 Feb. 1868.

162. With regard to fouling, do you consider that the small-bores foul very much more than the present bore?—The small-bores must always foul under any condition. Assuming that you employ equal charges of powder, of necessity the residuum from the charge must be deposited thicker on a small bore than on a larger area. If you burn a given quantity of gunpowder in a tube of a given diameter, the residuum amounts to so many grains, and if they are spread over a large area it cannot be so thickly deposited as on a small area.

163. You consider that the fouling is not a question solely of ammunition, but that it is a question of bore as well?—Yes, and a question of rifling.

164. Modifications as to powder and modifications as to weights in making up the cartridge would decrease or increase the fouling?—Of course, as you prepare your ammunition, it may be done injudiciously or properly. I assume that you have the best known ammunition, and the best known modes of preparation. My observation merely shows that no matter how a certain number of grains of powder are prepared, they will, under any conditions, deposit so many grains of solid residuum, which attaches itself to the sides of the barrel.

165. Do you consider that with good ammunition properly made up the fouling would be so great in small bores as to deteriorate the shooting greatly?—Not very greatly. My impression is this, that with properly devised ammunition there is no difficulty in having a ·450 bore rifle with regard to the question of fouling.

166. Do you consider that a gun ought to stand being fired say with 100 rounds, so as to heat the gun thoroughly, and yet fire fairly well afterwards?—Yes, certainly.

167. You think it ought not to deteriorate greatly after that in the shooting?—Not after 100 rounds.

168. Ought it with 200 rounds?—It ought to go 200 without seriously deteriorating the shooting of the muzzle-loading arm. With the oval small-bore, after firing 1,000 rounds without cleaning, the shooting was as good as it was the first round.

169. Were those rounds fired with pauses between them, or rapidly?—They were fired in every possible way; very rapidly some days, then they were fired deliberately, but the guns were tried in every possible way, and they kept their shooting up to 1,000 rounds, the muzzle-loader in the last diagram at 1,000 yards was somewhere about two feet.

170. Have you turned your attention to the locks of rifles?—Yes.

171. Do you consider that the present lock is capable of great improvement?—Do you mean in reference to future breech-loading rifles?

172. Yes.—I believe that the lock as it at present stands is obsolete in reference to breech-loaders to be made.

173. In what does its defects consist?—The lock as it at present stands is an accumulation of many devices which were necessary, first of all for the match, and then for the flint lock; then it came to percussion; but if you are to produce a model arm, according to my view, I think that there is no necessity for the employment of the modern lock at all, and that a modification of the spiral spring, as adopted by the Prussians, is preferable, because it is more simple, so much cheaper, and more easily repaired; furthermore, it permits you to give to the closing motion a motion in right lines with the axis of the bore, which I hold to be a very important matter in reference to any new arm.

174. Why is it so important?—Because it is mechanically correct.

Mr. C. W. Lancaster.

6 Feb. 1868.

175. And therefore practically good?—Yes, and it is much more simple, the most simple.

176. Do you know of any objections to spiral springs?—None when they are properly made.

177. Will the spiral springs stand sea water or sea air, for instance?—I do not conceive that they would be damaged by sea air, if they were properly prepared, any more than any other wearing portion of the gun.

177*a*. Supposing you damaged a spiral spring by sea water, and it was destroyed or broken, what does it cost you to renew it?—6*d*., and it is the only part about a gun of that kind that can be damaged.

178. Except that the whole store, if damaged by sea air, would be damaged in the same time that one could be damaged?—If you can imagine such a thing as that any one would keep them in sea water all the time, I can imagine that they would be destroyed.

179. With regard to the stocking of rifles, do you consider that there is any objection, on the ground of weakening the rifle, to half stocking it, as the American arms are made; there is a division in the stock?—I should prefer the stock all the way along.

180. For what reason?—I am presuming that the gun is what I should believe to be a model arm, doing away with the ordinary lock; to a gun of this kind I conceive that a whole stock would not be applicable; if you have metal behind it, confining the movement up and down or sideways, it would be impossible to have a very long stock all the way along. In many American arms, such as the Sharp breech-loader, it is not possible, because all the iron work comes in the way.

181. Is the Sharp breech-loader objectionable on account of the stock being divided?—Yes, it is more liable to break here (*describing*) than it would be if the stock were continued along; practically it has been proved by American experience that the Sharp breech-loaders have lasted excessively well in hard warfare, but I do not think that that is such a very great point to be considered.

182. Have you formed any decided opinion as to a metal base, or self-consuming cartridge?—I have seen a good deal of shooting with paper cartridges, both from the Chassepôt and other rifles, and the Prussian, and I believe them to be fatal to the accuracy of the arm as they are prepared. With the Chassepôt cartridge, in the trials which I have made with it, the cup repeatedly sticks on the end of the projection that contains the needle; then, in withdrawing it and reloading, this cup drops into the chamber, and when you insert another cartridge you cannot load without knocking out the whole cartridge.

183. That is not only fatal to accuracy, but is also the cause of missfires?—Yes, and that is owing to the very large size of the chamber that the Chassepôt has, to ensure as nearly as possible the combustion of the paper; the cartridge frequently drops below the centre of the needle point.

184. How do you think a paper cartridge should be made?—I think that the Prussian cartridge is better than the Chassepôt cartridge; they rarely have a missfire with the Prussian cartridge, but it has a longer needle, which is a disadvantage.

185. Is there not also an escape of gas in the rear?—Yes, to some extent there is, but in the new arm that is not so much the case.

186. Still there must be an escape of gas?—Yes, there is, but not to a very serious extent now.

187. With constant firing, would not the continual escape of gas deteriorate the arm?—Yes, with constant firing it would; but if you ask me my opinion as to which is the best, a metallic or a paper cartridge, I should say that a metallic cartridge is by far the best. There is no question, I think, that if you have paper tied over the top of the ball, as in the Chassepôt rifle, you never can hope for accurate shooting, because uncertain quantities of paper will go with the front of the bullet, and act like the tail of a kite.

188. Do you consider it is better to have a bullet with lubrication put on it in cannelures, or to put the paper on the bullet and the lubrication on the paper?—I should decidedly prefer wax lubrication in the cannelures, the same as Colonel Boxer has in his Snider cartridges.

189. Is that because you consider the paper is now and then the cause of inaccurate shooting?—It must be from the tail which I have described now and then. It is not cut through. With regard to the Enfield ammunition, until they had the happy thought of cutting it through at the side, it repeatedly formed a tail. Besides, in the breech-loading cartridges you must have cannelures for the ball, to fix it in the metallic case. I consider that absolutely necessary in metallic cartridges.

190. Do you see any objection to cartridges being made so that they could be refilled again. I am referring to the manufacture of the metallic cartridge; do you think you could get as good shooting out of cartridges that had been refilled?—I think you could get as good shooting, but practically I do not think they would ever be refilled.

191. Do you know anything about repeating arms, or have you seen any good ones?—I have seen the Spencer rifle tried, but it has not engaged my attention much.

192. (*Earl Spencer.*) You have said that you thought it indispensable that the cartridge should first be decided upon before you went into the question of the rifle, and that the country had lost a great deal of money in consequence of the contrary course having been taken?—Yes.

193. Would that apply equally to the question of the bore and the bullet, as well as to the question of a paper or copper cartridge?—Certainly. It is requisite to settle the bore, that is, settle the diameter of the bore with reference to weight, and then settle the charge of powder.

194. Fouling depends to some extent, does it not, on the grooving?—Yes, to some extent; the deeper the grooving the more likely you are to have fouling.

195. Your arm, I believe, is particularly free from the defect of fouling?—It is so reported.

196. Has the relative superiority been kept up in the small-bores upon your system as in the application of it to large-bores?—Yes. If you will refer to the report of the Committee in 1862, you will find special reference made to small-bores, and you will see how constantly at all distances it maintained its superiority.

197. I suppose you consider that facility in manufacture is an important thing with regard to rifling or making barrels?—I think, with reference to facility of manufacture, there is very little appreciable difference.

198. Can your system of rifling be made uniform?—Yes, either with an uniform spiral, or with an increasing spiral, with perfect facility, and it will cost no more than any other kind of rifling.

199. The quality of the arm turned out will be pretty uniform?—Perfectly so.

200. You spoke, I think, of the advantage which the spiral-spring system afforded as to mechanical resistance, I mean as to the recoil?—No; it was in reference to securing the admission of the spiral spring, which gives the effect of a blow upon your cap, and by so much more simple a means than by a lock. It is merely bringing back the spiral spring to a catch, and releasing it. In the ordinary lock you first raise the lever, and the blow is given through a circle. With the spiral spring the power exerted is always in right lines with the object to be struck, and therefore it must be a more mechanical and more simple way of doing it. The fewer the parts which you employ in a gun the better and more simple it is.

201. (*Mr. Ross.*) Do you think that cannelures with lubrication on the bullet itself are more liable to foul than when the bullet has paper on it?—I must first presuppose that it is a condition absolute as to all military ammunition, that it should have a waxed lubricator with it. Then I think it is better to put the wax on the bullet than on the paper.

202. Will you be good enough to state your reasons?—Yes. If you employ wax on the paper of a cartridge for a breech-loading arm, the paper will stick to the

Mr. C. W. Lancaster.

6 Feb. 1868.

bullet and produce occasionally wild shots; but there is no difficulty whatever about shooting with wax in the cannelures of the bullet, as long as the slug of the bullet is not so much as to cause a fouling in the rifle.

203. On the principle of forcing the bullets from the chamber into the barrel, I presume it is impossible to have paper upon the bullet, as it would be torn off?—The bullet to a certain extent does partially enter into the barrel, and I apprehend the paper itself would be to a certain extent entered into the barrel; but still to a certain extent the liability would exist of having the paper torn off.

204. In the other case of expanding or upsetting the bullet, the bullet lies completely in the barrel, does it not?—Yes, in the rifling.

205. You can therefore fire a rifle, under the same circumstances, more as if it were a muzzle-loader, upon the upsetting principle?—Yes, if all the rifles are muzzle-loaders and not breech-loaders.

206. I am speaking of a breech-loader; can you not so arrange your rifling that the whole of the bullet shall be in the barrel?—Yes.

207. Do you not more nearly approach to the principle of a muzzle-loader in the case where the bullet is beyond the chamber?—Do you mean without anything to do with the cartridge?

208. The cartridge need not be in the rifling, but that the bullet shall lie there; for example, there (*making a sketch*) is the chamber, and here is the bullet, and might not the bullet lie in the barrel itself?—The rear part of the bullet would be expanded by whatever the chamber is.

209. Might you not do it with a cartridge properly made?—There are some forms in which it could be done. I will endeavour to explain my meaning; this (*making a sketch*) gave very excellent shooting, and I had a paper cartridge; this (*describing the same*) was another bullet with paper round it, and then the plunger came behind it with a closing arrangement something analogous to the Prussian arrangement; you will see by the sketch that the powder is between the two bullets, and the chamber is surrounded there (*pointing to the sketch*); it was fired with a cap underneath, that was 8 or 9 years ago, and when the powder was exploded, this bullet (*pointing to the sketch*) was driven through the barrel, and the rear bullet was upset against that plunger, and when you loaded again you pushed that bullet (*describing*) from A to B into the rifling.

210. Was that altogether paper?—Yes, but it unfailingly cut off the escape of gas.

211. Have you tried the plan of putting a felt wad at the base of the bullet?—Yes, and it helped to clean out the fouling, but it also helped to destroy the shooting.

212. I spoke of a metallic cartridge; is there any reason why you should not have a felt wad in that case?—You could have a felt wadding that would help to clean out the gun. In all sporting cartridges we always put a thin wadding underneath the bullet, and that of course would help to clean the barrel out. But I imagine that the principal difficulty in fouling has been from the little difficulty that occurs as to the diameter of the bullet with reference to the bore, because that rapidly establishes fouling.

213. (*Capt. Mackinnon.*) Have you ascertained whether soft lead or hardened bullets fire the better, and which do you prefer?—They will both fire exceedingly well; there is no perceptible difference in the value of the firing, if they are both accurately made. In the hardened bullet you require a little difference in the diameter as compared with soft lead, and there must be a little difference in the shape of the cannelures upon it; you must put less work upon the ball, and the edges of the cannelures require to be narrower and finer, so as not to have that excessive work to be done that you want where it is of the same shape as the soft leaden bullet.

214. (*Capt. Rawlins.*) Could you determine which was the best cartridge for a breech-loader, by making experiments with a cartridge intended for a muzzle-loader?—No, it is a different proposition altogether.

The witness withdrew.

Colonel Henry St. John Halford examined.

Col. H. St. J. Halford.

215. (*Chairman.*) You have given, I believe, for some time very great attention to the subject of rifle shooting, and especially to military arms?—Yes, for about eight years.

216. And you have made many experiments with regard to military weapons?—Yes.

217. Would you agree that besides simplicity, the two chief requisites for military arms are a low trajectory combined if possible with accuracy at long ranges?—Yes, especially a low trajectory. I would sacrifice an extreme for a moderate range to obtain it.

218. To obtain those conditions, what do you think are the principal requisites?—I think you must have a gauge very much approaching to either side of the ·451, the size usually given to small bores. The departure should not be more than, say $\frac{2}{100}$ of an inch.

219. Is that better, in your opinion, than the half-inch gauge?—Yes, because you can use lighter ammunition and still get sufficient power to smash anything.

220. In order to obtain a really excellent weapon, what do you think is the best groundwork to go upon; is it best to fix the ammunition, then your barrel, and then the breech mechanism, or how would you proceed?—I should first of all settle my charge, my ammunition, in so far as weights go; that is to say, weights of powder and weights of lead, because you have to deal with the subject of recoil, with the weight which a soldier can carry and with the blow that you require to give. I think from what we now know we may form a pretty accurate idea of the weight of ammunition that is required; and I should adapt the gauge accordingly; for after all it is not the rifle that produces the final effect, it is the mass that you strike with, the bullet.

221. Supposing the ·451 gauge to be the best, what weight of bullet would you recommend, and what charge of powder?—I should recommend from 450 to 460 grains, for the bullet, and 80 grains of powder.

222. Do you think that with a bullet containing 450 grains you would not only obtain a low trajectory, but accuracy at long ranges?—Yes, you get with a 460 grain bullet a flatter trajectory at 1,000 yards than with a 530 grain bullet with the same charge; that I have proved. I am taking now a 90 grain charge of powder; the terms are hardly alike, but still given a 90 grain charge of powder, you get a flatter trajectory at 1,000 yards with a 460 grain bullet than with a 530 or even 540 grain bullet.

223. Would that hold good with 80 grains of powder?—I think so.

224. Why do you prefer 80 grains to 90 grains?—Because you get a cartridge very long with 90 grains, and you make your ammunition more cumbersome to carry. There is I think too much consideration given to recoil. I do not feel anything of it.

225. You think that the chief objection to 90 grains rather than 80 is the length of the cartridge?—Yes, that is the chief objection.

226. Supposing you could use the other description of powder, say the compressed powder which Colonel Boxer now uses, would there be any objection to using a larger charge?—None whatever, if the 90 grains of that powder are better than the 80 grains of the other; but (I can only give this as second-hand evidence) I do not believe it to be good, I do not think that the result from 90 grains of compressed

Col. H. St. J. Halford.

6 Feb. 1868.

powder will be so good as from 80 grains of ordinary powder.

227. Taking the 450 grain bullet and 80 grains of powder, what shape of bullet would you recommend—hollow?—I most undoubtedly recommend shell.

228. What shell would you use?—Metford's shell because it is the simplest; my opinion is hardly required on this subject. The War Office has not only the records of the experiments with that shell conducted by the Ordnance Select Committee, and they have pronounced it to be by far the best, but have actually adopted it; I have fired some thousands of them, and never had a failure with one.

229. Do you mean that the shell never failed to explode?—Yes, where it had three-quarters of an inch of anything to go through.

230. Do you get equally good shooting with a shell as with a bullet not used as a shell?—Yes, quite.

231. The shell would rather represent a bullet with a wooden plug at the end than a solid bullet?—Yes, it is used at present, in the Boxer cartridge, but I would substitute percussioning for the wooden plug. You do not require a base plug with a small bore, or even with a half-inch; but you require it with a ·577 gauge.

232. For shooting qualities you think that a bullet with a cavity at the fore end is better than a solid bullet?—In a large gauge certainly it is better; in the ·451 it is quite as good. They have the same angle exactly from a ·451 gauge rifle.

233. With the ·451 gauge why is it that there is no plug required at the base?—Because even with a 350 grain bullet the column of lead is sufficiently long to force the powder to upset it.

234. I mean with regard to breech-loaders?—Because I apprehend that you must have a chamber and force the bullet through the barrel.

235. The experiments which you have spoken of before were with the muzzle-loader, were they not?—Some with the muzzle-loader, and some with the breech-loader.

236. Were the experiments with the breech-loader equally as satisfactory as those with the muzzle-loader?—The shooting was not as good.

237. You spoke of the forcing, I think. Do you consider that the proper way of doing away with windage is by forcing rather than by expansion?—No, I do not think, with reference to windage alone that it is the proper way; but you have the question of loading at the breech. If you have no chamber you must, to ensure ease of loading, make your ammunition so loose that you get no good shooting. If you have your ammunition made the proper size for the barrel without the chamber the fouling prevents you from loading; it is a question of loading. At this moment I have a breech-loading rifle, with a beautiful barrel. It shoots magnificently, but not having a chamber you cannot load it for more than three shots without cleaning. I think, therefore that it is necessary to have a chamber for ease of loading, not to stop windage, as that may be done equally well without a chamber.

238. For a military arm you consider that a chamber is absolutely necessary?—I am afraid so.

239. With the rifle you spoke of the bullet is expanded, is it not?—Yes, the bullet lies completely in the rifling. All the cartridge lies in the rifling, and that rifle is perfect in its shooting; but you cannot load it without cleaning. It is utterly useless as a military arm.

240. You consider that for a military breech-loading arm a chamber is essential?—I regret I am forced to believe so.

241. With a chamber, do you think forcing or expansion the better way of getting rid of the windage?—I should use both and have as small a chamber as possible.

242. Therefore the reason that you do not have a cavity at the end of your ·451 bullet is because you adopt the principle of forcing rather than expansion?—The committee have misunderstood me. I should probably use a cavity. If a chamber must be used the bullet will have to be forced, but very careful experiments are required to show how much you must trust to forcing and how much to expansion.

243. What are the objections to forcing?—The heavy strain on the gun and the distortion of the bullet. You first upset the bullet into one shape and then drive it into another. With expansion the bullet lying in the rifling, the first blow of the powder puts it into its proper shape.

244. Does it not tend to diminish the initial velocity, I mean the forcing?—Not much, unless it is overdone.

245. I think you stated that you would recommend Metford shells as one of the ordinary projectiles to be used. Is there much difference in the price?—For large quantities about 1*s.* 6*d.* in the thousand. The Government could make them for that in the arsenal.

246. Do the shells penetrate well?—Yes. The effect of a shell is to make a hole as when a bullet strikes, but when it gets inside it explodes and blows out a place about as big as a man's two fists; the face and sides of the bullet are blown away, but the base travels on with a velocity amply sufficient to kill a second man. Of course it has not so much penetrating power as an ordinary solid bullet, but I think it has quite sufficient penetration. I am speaking now of a cavalry charge or anything of that sort at close quarters. You want to give a shock that will stop a horse. From what I have seen of deer shooting and what happens with a stag, I know that a horse struck by a shell must drop at once.

247. Are not Metford bullets made of hardened metal?—Yes.

248-9. Do you consider there is any objection to hardened bullets?—None whatever, but very great advantages.

250. Will you be kind enough to state what those advantages are?—Hardened metal will at 1,000 yards give an angle at least 15 minutes better than soft lead, and far greater penetration due to its increased power of keeping its shape on impact. This is because there is much less friction, the metal being to a certain extent elastic. Lead, especially soft lead, when it catches hold of anything causes enormous friction.

251. Do hardened bullets tend to wear the grooves out?—I think less than soft lead, on account of their not getting such a hold. For example, I have seen a steel die ruined by two or three bullets being passed through without oil, but it would not have been so with harder metal; the soft lead clings so tenaciously.

252. With regard to rifling, what system do you consider is the best?—I consider Metford's system the best, I think that the rifling, especially the spiral, should be constructed on the same principle as that of his match rifles. Perhaps it would require rather a deeper groove for a military breech-loader.

253. For what reason?—Because in firing a number of rounds, where you get a great deal of fouling, I think that a deeper groove, that is slightly deeper, will probably give in the long run better results, and that a rifle so constructed will hold its shooting longer, but it is a matter for experiment. Metford's grooving is excessively shallow, from $\frac{5}{1000}$ths to $\frac{6}{1000}$ths, and the same depth all the way through.

254. Is his grooving found to stand the test of continued firing?—He has fired out of his own match rifle from 10,000 to 12,000 rounds; he has used it for five years, and it is as good now as on the day it was first turned out. I also have one which is as good as ever it was. Metford's barrel is a steel barrel, but mine is of soft iron.

255. About how many rounds have you fired out of your rifle?—I suppose I have fired 3,000 or 4,000 out of it.

256. Is the Metford principle of rifling that of an increasing twist?—Yes.

257. Do you consider that a proper principle to adopt as to rifles?—Certainly. I believe it is the only true principle, and that any practical engineer will tell you so. I believe that you get rotation on easier

terms than in any other way. You require a final pitch of a certain amount. Whitworth has taken 20 inches, and others have taken different amounts, but I will presume the barrel to be 36 inches long, and you want 20 inches of final pitch. You have to give nearly two complete revolutions in the barrel with an even spiral throughout, but with Metford's spiral you only give about a turn and a quarter, and get the same final pitch, with less friction. Metford's rifling is constructed on the principles laid down for the expansion of gas, and there is an even pressure on the edge of the grooves to give rotation the whole way up the barrel; or in other words that the torsional force applied to the projectile shall be uniform throughout its travel along the bore. Thus he is able to use few and shallow grooves.

258. What do you consider is the best length of barrel in shooting?—I am inclined to think that for a military arm, if a short sword is not objectionable, that I should give a barrel of about three feet.

259. You spoke, I think, of the comparative shooting between a muzzle-loader and a breech-loader; does the shooting, in your opinion, deteriorate from a breech-loader?—The shooting will always be worse where you foul the barrel before the bullet, and the reason why a muzzle-loader shoots better is because you clean it out every time you load it.

260. Could you not clean out the barrel of a breech-loader with a wad?—Yes, to a certain extent, but the fouling from the last discharge remains before the bullet. I should propose a wad containing lubrication, as thin in quality as it is possible to get it, compatible with its durability. I mean with regard to climate.

261. Do you mean lubrication placed upon the wad?—I should say that the wad ought to be charged with the lubrication, and the powder should be defended from it. Again, I should put some sealing between the wad and the bullet, but it must be of a nature not to suck up anything; in other words, it must be oilproofed.

262. Somewhat like the Whitworth mechanical wad?—No; I should put a thin oilproof wad of some kind, made of some fabric, but not metal. The difficulties will, I fear, be insurmountable, because of the searching nature of the oil.

263. I suppose besides putting the lubrication on the wad you would put it also on the bullet?—Yes, I think so.

264. Would it be better to put lubrication on the bullet or on the paper which is put on the bullet?—Paper has many valuable qualities, and I should be loth to part with it. For a breech-loader, we must dispense with paper unless we can obviate its rucking back. You push the bullet into the chamber with the open end of the paper forward, and it probably rucks and causes a jam; but a naked bullet can be easier forced over any small grit that may be in the way.

265. May it not happen that the bullets are so tightly fitted to the cartridge that as the bullet leaves it it tears off the lubrication from the cartridge, being too tightly necked round it?—Yes. I do not think it would be well to make it very tight, although it should be a close even fit. I do not think that a number of cannelures would be necessary.

266. Are cannelures useful only for holding the wax or for determining the flight of a bullet?—Where there is sufficient rotation only to hold the lubrication. I believe them to be a positive harm afterwards, because the moment the bullet has left the rifle they catch the air and cause friction. I believe you will find that a cannelure bullet will have rather a greater initial velocity, but will lose it quicker than a bullet with no cannelures. It does not touch so much of the barrel.

267. I believe you have directed your attention to the subject of cartridges?—I have somewhat.

268. Have you formed any decided opinion as to what system is the best, metal-based cartridges or paper cartridges?—I think the metal cartridges are the best. I think that in a metal cartridge you get resistance to the weather. It is waterproof. Wet does not affect a metal cartridge if it is properly made, but a paper cartridge, however well made it may be, must be affected by wet. I would not cover the metal cartridge with paper.

269. Supposing those difficulties were overcome, do you think, as to principle, that a paper cartridge is applicable to a breech-loader?—I should doubt whether it would be so good. I think you may get the same strength with a much thinner cartridge in brass. It is an object to get the chamber as near to the size of the bore as you can, and it is a great object to have the cartridge no larger in diameter than the bullet if you can avoid it. Moreover the paper being more compressible than brass would allow the bullet to be too much expanded in the explosion.

270. With regard to fouling, do you consider that small bores could be made, so that they would not be greatly injured in their shooting qualities by fouling?—Yes, I think so. I think that fouling can be got over in a great measure. I think that a small-bore will always catch fouling rather more than a large one, because the proportion of surface of barrel to the powder is less; but I think it may be got over by the wad, which should be much larger than the bore. I think it should be squeezed up behind the bullet. The great evil of the chamber is, that as the bullet leaves the cartridge it passes over the space between the end of the brass cartridge and the bore of the barrel, and there is very likely to be an escape of gas, which is very fatal to good shooting. I do not think there is anything much more fatal to accurate shooting than escape of gas by the bullet.

271. Have you given your attention to the locks of guns?—Yes, I have thought over them a good deal, and I think that for a breech-loader the ordinary lock is hardly the right thing.

272. What should you recommend generally?—I think that about the best lock I have seen is the lock of that gun that I got into trouble with; it is something on the window-bolt principle; it is one of the most simple things in the world. There are I think but three pieces in it, and it acts perfectly. I believe that to be as good a lock as could be applied to a breech-loader; it is a centre lock; it draws back straight behind the central fire, and lies down flush with the stock when it is at full cock.

273. It is also a cheaper lock, is it not?—I should think so.

274. It is not a spiral spring lock?—No, it is a very simple lock. I am not now expressing my own opinion only, but I have known one or two good mechanics who have expressed their opinion in its favor, and who think it is as perfect a lock as can be made.

275. Have you at all turned your attention to the subject of repeating rifles?—I do not know much about them. I am not *primâ facie* fond of them, for I think if you fire a number of shots you will not find them quicker than other rifles, and I believe you must use a very short cartridge with them.

276. (*Earl Spencer.*) You have stated that you consider a low trajectory an important thing for a military weapon; do you consider penetration also of considerable importance?—To a certain extent I do. I do not think that you require more than a certain amount of penetration, but I think there are very few rifles which at a short range will not give the required amount of penetration with a charge of 80 grains of powder.

277. Penetration or smashing power?—I would rather take the smashing power than penetration. You may have enormous penetration through flesh with a long heavy bullet running at low speed, but you will not have the same smashing effect that you would have with a light bullet at high speed that stops sooner. I imagine that you do not want to go through a great amount of flesh, but you want to get a certain result. For example, if the whole shock is received in the breast of a horse it will stop him sooner than if the bullet went through him. The theory is

Col. H. St. J. Halford.

6 Feb. 1868.

that the bullet should just *pass* through the body, and no more, that is, that the whole work (foot pounds) should be absorbed in the animal.

278. What is the lightest cartridge that you would recommend, consistently with its having proper smashing power?—A cartridge containing a 450 grain bullet with 80 grains of powder.

279. Comparing the smashing power of a bullet from a small-bore with that from a large bore, such as you have mentioned, what would the difference be?—You will not have the same speed with a large-bore as with a small-bore bullet, because you cannot make the bullet lighter with a large-bore than 480 grains. You lose power very rapidly. The trajectory with the present service ammunition at 600 yards is, I believe, very bad.

280. With the Chassepot rifle they use a bullet of 393 grains and 86 grains of powder. I suppose that would have at a certain range considerable smashing power?—No, it is the worst trajectory of any rifle out, other things being equal, and the least initial speed, which is, I understand, 1,072 feet per second.

281. Would you attribute that to the lightness of the bullet, or to the bad construction of the arm?—Mainly to the bad construction of the arm.

282. With a light bullet and a heavy charge of powder, do you not get great smashing power if the barrel and the grooving are good?—Yes, but I believe the Chassepot loses its power by the chamber at the back for consuming the paper cartridge, by excess of forcing and by compressing their powder. The French are now converting the Chassepot rifle to take a metal cartridge.

283. You do not require a large heavy bullet to obtain smashing power?—Certainly not. I have been using a 350 grain bullet for a sporting rifle with $5\frac{1}{2}$ drachms of powder, and even with a solid bullet the result is something tremendous.

284. Has not velocity something to do with it?—Yes, the effect is obtained by the velocity.

285. You have said something about recoil, but that you were not aware of it personally. I suppose that soldiers not very well trained to the use of the arm would feel the recoil a good deal?—I am told that they do.

286. Have you made any experiments with compressed powder?—I have only heard of it second-hand. Mr. Metford has made some experiments with it, and he told me about it. He said that he had been trying it and that he could not get better results out of 90 grains than out of 80 grains of ordinary powder.

287. It seems important to obtain a clear explanation of the words "forcing" and "expansion." Can you give the Committee a definition?—Expansion takes place always with soft lead. Where you force a bullet it is expanded into whatever space there is round the site of it, and then it is reduced in size by being forced through the barrel like wire drawing, or rather pushing.

288. In the case of the rifle you have described would you apply the term "forcing"?—I have two rifles, and in one forcing is used, and in the other expansion alone.

289. Will you be good enough to describe the difference between the two?—You can scarcely drive a bullet, which requires to be forced, through a barrel with a hammer. A bullet to be rifled by expansion only will slip down through the barrel easily.

290. Might you not combine the two, and arrange for a bullet which could slip down the barrel to be first expanded into the chamber, and then forced afterwards?—I tried that, and I found an enormous escape of gas with a bullet sufficiently small to pass down through the barrel. I tried it in a chambered gun, the bullet lying in the chamber, but the windage was so enormous before the bullet is expanded that the gas rushed by. I am convinced by experiments since made by Mr. Metford that this source of error can be controlled by a more careful proportion of chamber to barrel.

291. It is expanded into the chamber first before it enters the barrel?—Yes; but I think you are asking it to do too much.

292. With the Snider naval rifle what happens with the ammunition used with it?—I have not tried that. My experiments have been carried out by firing into soft sawdust, and getting the bullets out afterwards.

293. If you have the cavity at the base filled with wood or terra cotta, has that any influence in expanding the bullet?—It squeezes out the sides in the large bore; in the small bore it would have no good effect I think. I do not know whether I have made myself clear when I have talked about expanding in the chamber, but what I mean is, that I think you cannot dispense with a chamber, for if you have the bullet small enough to lie in the rifling and yet ensure ease of loading, you will have an escape of gas by it. You should therefore have the chamber large enough to receive easily a bullet, which, with the help of a wad will block the fire, but not so large as to require an excess of forcing.

294. There are various causes of fouling, are there not?—Yes, some rifles catch more fouling than others. I had one cut to a very heavy pitch indeed, 13 inches, on Metford's principle, and that thoroughly showed what was taking place; there was no fouling in the lower part of the rifling where the pitch was light and could bear it, but within a foot of the muzzle the fouling was so great that we could hardly scrape it off. I believe the fire then could not continue to follow the grooves, but made its way across them. The fouling deposited was so great that I could not load at all.

295. Was not that in consequence of the barrel being too long?—No, it was on account of there being too great a pitch in the barrel; and that in a less degree happens with rifles where there is too deep rifling. The fire runs in waves and impinges on the edges of the rifling—the fouling then sets hard.

296. (*Mr. Ross.*) When you speak of too much rifling, do you mean too much twist?—By too much I mean where it is too deep.

297. (*Earl Spencer.*) What is the utmost amount of twist that you can give with safety?—Fifteen inches will do, and 13 inches will not.

298. You would say one in 15?—Yes; but I should give a final pitch to a ·451 gauge of one in about 17 inches, which is anyhow sufficient to ensure steadiness of flight to 1,000 yards, with a bullet of 450 grains.

299. What would cause the fouling with an uniform pitch at the muzzle end of the barrel and not at the breech?—I apprehend from the lubrication being all used up before the bullet reaches the muzzle.

300. Do deep grooves increase the fouling tendency of a gun?—Yes, certainly.

301. In that way the Metford rifle would be valuable?—Yes; the less grooving you have the less fouling there will be.

302. I did not quite understand why you thought the depth of grooving adopted by Metford for his match rifles would not be sufficient for military purposes?—I think you want rather coarser grooving, partly because of wear, and because you do not get such a perfect fit with the bullet in the barrel. The two are balanced beautifully now in the match rifle. The fit of the bullet is perfect, and I think where you have rather coarser materials to work with, it is safer to get a better hold. I say this because I have had barrels rifled from $\frac{4}{1000}$ths to $\frac{10}{1000}$ths on that principle. The barrel cut to $\frac{4}{1000}$ was evidently too shallow in the rifling, and we had to re-cut it, and we found that five, six, and seven thousandths all shot about equally—you could hardly detect any difference between them—but when we came to 10 we began to collect fouling. I should say that seven to eight would be about the thing. I should think that would be the best.

303. You do not think that practically shallow grooves would wear out soon?—No I do not think that they would.

304. In the case of a hardened bullet can you depend upon the bullet taking the twist with certainty?—Perfectly so. I have some excellent samples

of bullets that are rifled not two-tenths of an inch from the base. They have a very weak base, but the bullet is so hard that the powder has power to only just spread it, and for that distance it is rifled, while the rest of it is not touched with the rifling. These bullets shoot beautifully; though they are half stripped by the lands. In fact, I wish to draw the particular attention of the Committee to the fact that both the position of the rifling and the amount of it as given by expansion can be entirely controlled by the shape of base and hardness of metal. I cannot, while referring to this branch of the subject, feel satisfied unless I observe that perhaps, especially on this question of hardened lead and the governing of its expansion, I have availed myself of the exhaustive experiments of Mr. Metford, to whom we are no doubt indebted for the present expanding hardened match bullet.

305. Have you had any experience of the Lancaster system of rifling?—I have had a little.

306. What do you think of that system?—I think it is the worst system out for everything but fouling, and for this reason, that in giving your rotating force you are acting by two surfaces very oblique to the radial line of the bore grinding against one another, instead of applying the rotating power by the edge of the rifling. I think the rifling should be approaching a radial from the axis of the barrels, as by that means you get a clean hold on the edge; but if you take the two surfaces as he does, and attain your end by their pressing against one another, you cause enormous friction in the barrel. I think Whitworth's invention is open to same objection, but by no means in the same degree. For the matter of fouling this last is very bad, whereas Lancaster's is good.

307. In that way do you suppose that you lose velocity?—Yes, enormously.

308. What bore, upon Lancaster's system, have you tried?—I have tried the small-bore with the ·451 gauge.

309. And as it got smaller I suppose the objection would be greater?—Yes, Mr. Lancaster has beaten the Enfield with his ·577 gauge rifle, but that was due to his having adopted a much quicker spiral in his rifles.

310. Do you think his rifle would be likely to beat the Whitworth?—Do you mean one of Whitworth's small-bore rifles?

311. Yes.—I should prefer the Whitworth even with cylindrical bullets to the Lancaster, provided I was allowed to keep the Whitworth clean.

312. Have you ever seen the Lancaster match rifle?—Not the short stocked. I have seen the long stocked match rifles, and I used to get wild shots out of them very often.

313. Have you paid much attention to the different kinds of lubrication used?—Yes.

314. Which in your opinion is the best?—The best lubrication is oil.

315. Do you think that that can be applied to a military weapon?—I hope so. I should try to use it in the wad. If paper is done away with, my idea is to have two kinds of lubrication, one in a single cannelure and the other behind the bullet in a wad. I think it is hardly fair to send a naked bullet through the barrel with the lubrication only behind it.

316. How would you put the oil into a cartridge?—I should saturate the wad with it, and I should put on both sides of the wad some substance, not india-rubber, that would not suck it up, and defend both the powder and the lead from it. I think it may be sealed in its place in the cartridge, say thus: Having put in the powder, place next a tight-fitting disc of shellaced paper or thin card. Then, with a brush sweep round the joints as well as the surface of the brass with shellac varnish. Leave this to dry. Then push down a thin hard wad saturated with oil of a high quality. Clear off any oil left on the sides of the case, and place another such card disc over the wad. Sweep round again with shellac, and after drying insert the bullet. Whether some such system as this can be carried out in a large manufacture is the point.

317. Do you think tallow grease entirely bad?—I think it is very objectionable, because it corrodes the bullet, and in a cold climate like Canada gets hard and flakes, while in a hot climate it melts; whereas if you use oil and defend it you may keep it, and it can get neither better nor worse.

318. What is your opinion about a lubrication of pure beeswax?—It would do, I think, in a hot climate, but not in a cold one; it is not sufficiently lubricating. I do not think it is suited for this climate. If you were firing quick and got your gun hot it would do very well, but not otherwise. In a cold climate I do not suppose you would ever get the gun hot enough to make the beeswax act well.

319. Do you entertain a strong objection to the principle of a sliding bolt?—Yes, a very strong objection.

320. Will you state the reason why?—I think that whenever you put pressure, as you may have to do, on a cartridge to get it in, and that pressure is directly in the line of fire, accidents must happen. I believe that Major Fosbery's gun is also dangerous on that account. I think the only safe principle is that of either the Snider or the Henry, or some such form where you come across the end of the cartridge and not up to it.

321. You do not think it is sufficient if the cap is countersunk?—No; I think you are putting a very heavy pressure on the powder from the bullet end, and with a faulty construction of the cartridge, or a weak one, I think you may get into trouble.

322. Perhaps not on ordinary occasions, but when the shooter becomes excited?—Yes, as he would become on service.

323. Have you tried any experiments with Major Fosbery's invention?—No, I have not.

324. Your experience is probably derived from the accident which happened to you at Wimbledon?—Yes. I have thought a great deal about it since, and I have come to the conclusion, after what occurred, that when pressure is put on a cartridge with any hard surface it is dangerous. The cartridge ought to be pushed in by the hand.

325. Do you believe that that was the cause of the accident which occurred at Wimbledon?—Yes, quite so.

326. Have you at all considered the spiral spring action of a lock?—Yes, and I do not like it. I do not think such springs are likely to stand wear.

327. For what reason?—Because my impression is that they are more difficult to manufacture at present, and spiral springs have certainly been found to cripple sooner than others.

328. Do you mean in experiments with guns?—Yes. I have a shot gun with spiral springs for the pistons, and for one or two other things I have had spiral springs, and I know they are apt to cripple; they are harder in fact to make.

329. Would you prefer a loose piston to a piston with a spiral spring?—Yes, if it could be got, certainly.

330. (*Mr. Ross.*) Do you think that your objection to a breech-loader on the sliding-bolt principle would hold good if it was impossible for the piston to remain out after firing?—Yes. I do not think it need happen with the piston alone. I think that you are putting tremendous end-on pressure upon the cartridge. The cap is very close to the seat of the blow at one end, and they are making caps of a very delicate kind now.

331. How did the accident happen which has been referred to?—It happened, I believe, from the pushing one of those bolt-guns up with a run and from the cartridge sticking. In that particular instance I think it happened from the piston being driven in with force, by the wrist. It should be recollected that in the gun in question, the other end of the piston was exposed.

332. You spoke just now of occasional wild shots from the Lancaster rifle, has not that happened with other rifles?—Yes, with the Henry and others, but how far this may be due to the faulty ammunition, I am hardly prepared to state.

333. How would you accoun for those occasional wild shots?—I believe they are very much owing to fouling in the barrel, that checks the bullet, or from

Col. H. St. J. Halford.

6 Feb. 1868.

fire getting past the bullet, this is about the worst thing that can happen. When the fire is not blocked the bullet is canted as it leaves the muzzle. I believe that error takes place at the muzzle in 99 cases out of 100. If you find a rifle that will shoot perfectly at 12 yards, given other qualities, that is, sufficient spiral and sufficient weight of bullet, it will shoot at a long range. I have found with match rifles that I could pick a rifle from shooting at 12 yards. The error shows itself distinctly at that distance. You may diagram it out, and you will find that the error of the Enfield rifle at 12 yards is about in the same proportion to its error at 300 yards.

334. I suppose that wild shots may be sometimes accounted for by the paper round the bullet adhering to it after it leaves the barrel?—Yes.

335. With an increasing twist, such as Metford adopts, I suppose a hardened bullet is necessary?—It will make much finer shooting.

336. Can you obtain good results from a soft leaden bullet with an increased twist?—Yes.

337. Would you adopt the same form of rifling and the same amount of twist in the half-inch bore as in the ·451 bore?—No.

338. What alteration should you be inclined to make?—You must take the proportions. First settle the extreme range at which you require accuracy, then presuming that you have the proper amount of rotation settled for one gauge you can take them out for the other by proportion; I think I may put it in this way: That to give two bullets of like proportions, but of different diameters proportional stabilities, you will require to give the surface of each the same velocities of rotation. I assume that the specific gravity of the two bullets is the same.

339. What are the main advantages of the ·451 bore over the present Government bore?—You can use lighter ammunition with a much lower trajectory, and with far greater accuracy. At all ranges you will have greater smashing power, on account of the superior velocity.

340. Do you think that in a proportionate degree the ·451 bore has the same advantages over the half-inch?—Yes. I think I should almost go below ·451 if I had to choose rather than above it. I think it is about as good a gauge as you can get. As an example of what takes place I have a rifle of ·380, which is about 112 gauge, and with a bullet of 150 grains and two and a half drachms of powder the smash is something astounding at 200 yards.

341. (*Captain Machinnon.*) Is there any particular proportion as between the diameter and the length of the solid bullet, which gives the best shooting?—Yes, I think that the steadiest shooting at long range is got out of the 530 grain bullet and a 460 gauge barrel; but it requires 90 grains of powder. I do not think that the 530 grain bullet is the best bullet for military purposes.

342. (*Captain Rawlins.*) You were speaking of the advantages of the small bore over the present service bore; are there no counter disadvantages, or are there any advantages which the large-bore has over the small one?—I cannot see that there are any, except the fouling.

343. Might not two sorts of ammunition be fired out of the same gun, one for long and the other for short ranges?—No. I think you would get into difficulties there. You would want a different sighting in that case, and I think that that would be a great disadvantage. I do not think you will get any advantage by having the heavier bullet for long range, as you get a flatter trajectory at 1,000 yards with the lighter bullet, but lighter bullets in stormy weather do not hold their own so well as heavier bullets; but I do not think there are sufficient advantages in the heavier bullet to counterbalance the advantages which the lighter bullet has. Then, again, you must remember this, that you have a different shape of cartridge, and the gun that is chambered for one will not do for both.

344. (*Mr. Ross.*) Might you not have the same form of bullet outside but hollowed inside, so as to give lightness to it, but its length and circumference still remaining the same?—Yes, you might do that by making the heavier bullet solid, and thereby sacrificing the advantage of using shell. I do not see at all what you would gain by a heavier bullet.

345. (*Captain Mackinnon.*) Are you now speaking of the 450 grain bullet?—Yes.

346. (*Captain Rawlins.*) Might you not have one that would do for 500 yards, and another that would give great accuracy at 1,000 yards?—I think it is not advisable to have two sorts of ammunition.

347. With regard to shells, would you be inclined to substitute an explosive shell for the ordinary bullet?—Certainly; I would use it entirely. It does perfectly well at the targets, and there is no more danger in it than in a solid bullet.

348. Would there not be more danger if it were kept in store?—Not a bit; you may put one of Metford's shells into an empty rifle, and take an iron ramrod and bounce it down until you bounce the ramrod out, but it will not let it off. A 6 lb. hammer will only just let them off if it falls on to them, but the speed gives the blow necessary to explode them; they take from half to three-quarters of an inch of flesh to let them off.

349. They would be applicable to small-bores?—Yes, or for any kind. I have used them for both.

350. (*Chairman.*) Have you used them for small-bores, and are they just as good?—Yes, and weight for weight they require the same angle of elevation as solid shot.

351. (*Captain Rawlins.*) Is it your opinion that the shell has no disadvantage whatever?—Yes, it has none whatever. I have a very strong feeling about the shell. I am almost certain that the French will have these shells at once, and I believe that no troops can stand against them; the moral effect produced is, I am told, fearful. They have been tried in a small way in India. I apprehend that what you want to do is to demoralize the enemy's troops.

352. In the case of a shell striking the body of a man, is it certain that it would explode in him and not go through him and explode afterwards?—Yes, it will explode to a certainty in him; it takes only three-quarters of an inch of meat to do it; I mean that extent of penetration. The base of the shell would pass through him unless stopped by bone, and kill a man beyond.

353. (*Earl Spencer.*) What do you think would be its effect on a rabbit?—That you would have considerable difficulty in finding any of the rabbit.

354. You believe that it would always explode to a certainty?—Yes.

355. (*Captain Rawlins.*) Supposing you fired it at several $\frac{1}{2}$-inch planks, would it explode, do you think, in the first or the second plank?—They go at times through a $\frac{1}{2}$-inch plank without exploding, but in a $\frac{3}{4}$-inch plank they never fail to explode, and they explode in this way: the edge of the lead punches out a plug of the material through which it passes, and if that plug is not of sufficient weight of itself to explode the shell it carries it on without doing it, but we find that anything three-quarters of an inch thick, even of the softest deal, will explode these shells. Then there is another great advantage which I can point out, and that is in getting your range. You can see where the shell explodes; you know where the bullet hits, and very few shots will tell you whether you are firing short of or over the mark. I consider that for the purpose of judging distance they are invaluable.

356. (*Chairman.*) During sieges they would not be so applicable perhaps for penetrating gabions or fascines?—No. I do not think they would go so far through them, though they would shake them to pieces much more.

357. Or through mantlets?—No, they will not penetrate so deeply.

358. I think you have stated that the initial velocity of the Lancaster rifle is much less than that of the Metford?—Yes.

359. Have you ascertained that by experiments?—Yes. It is some years since I had to do with it, but I ascertained the angles of the Lancaster rifle then, and I compared them with the Whitworth. I compared these again with the Metford. The angle of the Whitworth is about 10 minutes better than the Lancaster, with the same charge, at 1,000 yards. Again the angle of the Metford is about 10 minutes better than that of the Whitworth.

360. Were your experiments carried on at different times?—Yes; and they were carried over a number of shots quite sufficient to exhaust all the difficulties arising from weather.

361. Do you think that all the circumstances were similar?—Yes, as regards weather.

362. With regard to lubrication, do you think that beeswax is less adapted for the lubrication of the ·451 bore than for the ·577 bore?—I think it is, because the proportion of the diameter of the barrel which must be taken up by the beeswax in a large-bore is less than in a small-bore. You give in both the same thickness of lubrication, but if you put it into a small bore you take up a greater proportion between the bullet and the barrel than in the large bore.

363. You appear to object to spiral springs, but did you ever try the ribbon springs?—No, but I have been told by a mechanic that they are as bad.

364. Do you consider that oil will stand in cold climates?—I believe it will stand better than anything.

365. Have any experiments been tried with it?—I do not know that they have, but I know the effect that cold has on oil. I have had it nearly frozen, and if it were frozen hard of course it would be less capable of doing its work, but then it would be incomparably better than beeswax, because beeswax becomes solid at a much higher temperature than oil. I believe you cannot have your lubrication too fine. You are using under the best circumstances a very small quantity of lubrication to lubricate a very great surface of metal; it is impracticable to use a larger quantity.

366. (*Earl Spencer.*) You have stated some curious facts about the fire from the explosion outrunning the bullet, have you made any experiments which enable you to tell us anything more about that?—I have made very many experiments, and I find that unless you completely block the fire you get wild shooting.

367. Can you give the Committee the results of any of your experiments?—Firing into sawdust I found the bullets to be scored up the sides by fire when they had been too small for the barrel, or when the wads had been imperfect by being either too small or not sufficiently stiff. I also made some experiments with the Westley Richards rifle, a chambered breech-loader. I wanted to get a different shape of bullet to that he uses for the purpose of improving the shooting. I therefore had different shaped bullets made for me according to their sizes. I found them cut by the fire. The block which ought to be used not being behind them. Then I tried another breech-loader, having a barrel without a chamber, and using a cartridge that was made up without a wad between the powder and the bullet, with lubrication simply on the paper, but the bullet became so cut with the fire that it did no good; and it was some two years before we overcame the difficulty by putting a wad into the cartridge. It was at last done by filling up the cavity in the rear with blotting paper and placing a very large wad crumpled up into the shape of a mushroom, between the bullet and the powder, and this wad being prevented by the blotting paper from entering the cavity, filled up the space by the sides of the bullet, between it and the barrel. You must have a wad, a convex wad in fact, much larger than the barrel, which as it leaves the cartridge opens out like an umbrella.

368. What did you find to be the effect upon the bullet when it had the scored marks upon it?—It was cut in three or four places up the length of the bullet, and the surface of the lead was actually melted.

369. (*Mr. Ross.*) With regard to the size of a wound made by a solid bullet, do you consider that the size of the wound depends upon the velocity and weight of the shot more than upon its diameter?—Velocity, not diameter. I consider that velocity will produce more effect than any additional weight or diameter that could be practically used in a small arm. You cannot get high velocity with a heavy shot without a great increase in the charge of powder.

370. Do you think that a larger wound would be made with a small-bore bullet at great velocity than with a larger bore and less velocity?—Far greater.

371. (*Earl Spencer.*) Why do you dislike the Whitworth system of rifling?—Because I believe it is peculiarly inapplicable to breech-loaders from the excessive depth of the grooving. I think there is a waste of power in giving rotation. The rifle fouls extremely and there is very great friction.

372. Do you get more wild shots out of the Whitworth than out of the Metford?—Certainly. With *cylindrical* bullets the escape of fire causes very wild shooting.

373. Have you fired many shots out of the Metford rifle without cleaning it?—I have fired sometimes 100 shots at a time without cleaning at all, and then I have simply put in a piece of cloth with the ramrod and taken it out and fired again. I never clean a Metford rifle with water.

374. Does the accuracy of firing not deteriorate with that rifle?—Not in the least, that is, not with the muzzle-loader.

375. What is the difference between the Metford rifling and the Rigby rifling?—The cut is very much the same, but Rigby has used nine grooves instead of five, because I suppose he is afraid of stripping, and there is more tendency to strip with an even pitch of rifling. Half the initial velocity is given to the bullet in the first three inches from the powder, and Metford starts with a low pitch of rifling, increasing the spiral until he attains at the muzzle the rotation he thinks desirable according to the law I have already stated. The stripping intention is reduced to a minimum, as fewer grooves and lighter rifling are required. There is less friction and a greater initial velocity is the result. In point of manufacture and for lasting, the fewer the grooves the better. The great thing in the manufacture is to leave as much of the old cylinder as possible in the rifle. You can only test the barrel as to its being straight and parallel before it is rifled, and if you cut nearly all that away you cut away the foundation of truth; every cut that you put in is more liable to make a waster barrel, and so spoil the barrel in manufacture. There is no more difficulty in rifling a Metford than any other shape. The Lancaster is the most difficult.

376. You prefer Metford's rifling to Rigby's?—Yes. I believe that the Rigby rifle will shoot very well, but this has been attained by Rigby having adopted Metford's cut of groove and Metford's bullet.

377. Is there any other system besides those we have mentioned, the Enfield, the naval, the ordinary, the Lancaster, the Whitworth, the Henry, the Metford, the Rigby, and the Westley Richards, that you think worthy of any attention?—The Westley Richards and Whitworth are practically the same; I do not think there is any other. The Turner rifle is of no use at all, it is very faulty; and the Henry, has in my opinion grave faults in its system of rifling.

378. (*Mr. Ross.*) What are your reasons for objecting to the rifling adopted by Henry?—He has so many angles that it is more liable to foul. Henry's rifle would be far better if he left out one of his angles; in each cut the one on the reverse side of the driving edge (*explaining by a sketch*); supposing that this is the driving edge, what does he want with the angle on the reverse side? If he filled that up his rifle would be better.

379. Have you tried any experiments in firing with the Henry and the Metford rifles?—Yes; and I have found that the Henry will only shoot in wet weather, when the fouling gets very slobby indeed; directly you came to any difficulties arising from the weather the Henry throws wild shots.

380. Have you had more experience of fouling with

Col. H. St. J. Halford.

6 Feb. 1868.

muzzle-loaders than with breech-loaders?—I have had a good deal of experience with both.

381. Have you fired rapidly?—Yes, I have fired rapidly, and I have found every breechloader fail from fouling.

382. (*Chairman.*) Will the Metford rifle fired in the same way fire well?—I have not tried it on the same terms with a chambered gun. I have tried the Henry and the Westley Richards, but I have not tried the Metford on the same terms.

383. (*Mr. Ross.*) Do you think it is more trying to an arm to fire out of it a certain number of shots with great rapidity, than the same number of shots slowly?—Yes, it is much more trying.

384. Are the Metford grooves cut square or circular?—They are cut a little circular.

385. (*Earl Spencer.*) If you were about to direct your attention to finding the best breech-loader, would you first decide on the cartridge including the weight of the bullet, and then find a barrel and bore for it, or would you first begin with the barrel and the bore, and then find a cartridge to suit them?—I should take the cartridge first—that is to say, the powder and the lead. I do not refer merely to the shape and internal manufacture of the cartridge, because I think that a number of experiments are required to be made to ascertain the best way of blocking fire behind in the cartridge, and also the best way of applying the lubrication.

386. (*Chairman.*) Powder, lead, and length?—Yes; the powder and lead would give the length.

387. (*Earl Spencer.*) You would probably select two or three principles of construction, and subject them to different tests?—Yes, and I think I am not mistaken in the direction in which success is to be found.

388. You do not perhaps think it is yet decided which principle of rifling the bore would be the best for a military weapon?—I think some small latitude may be allowed to the bore. Having settled the bore, and from that the final pitch of rifling, I should determine the depth of the grooves by experiment. I should adhere strictly to Metford's principles of rifling as they are founded on correct laws proved to be correct by practice, and they are equally applicable to great guns or small arms.

389. You do not think that the breech mechanism would very much affect the shooting?—No.

390. (*Mr. Ross.*) Do you approve of bullets with an enlarged ring round the base such as Westley Richards uses?—I do not like them.

391. With bullets so made, I suppose the whole of the bullet lies in the rifling?—The nose of his bullet only enters the rifling. He uses a large chamber, a bullet ·458 in the body with a rim ·470 in diameter, four thicknesses of paper ·008, making in all ·478, and this has to be driven through a ·451 barrel.

The witness withdrew.

Mr. A. Henry.

Mr. Alexander Henry examined.

392. (*Chairman.*) You have had a great deal of practical experience in the manufacture of rifles?—Yes.

393. Have you directed your attention at all to the manufacture of good military rifles?—Yes.

394. The Committee have had your rifle before them, but in the course of the competition have you gained any experience that has enabled you to improve your rifle?—Yes, very much indeed. The question of ammunition is a most important matter. I can improve that very considerably, and, yesterday and the day before I was trying experiments with some that I shall show you. I find it is possible to make considerable improvement. I have made trials with four different kinds of ammunition. One has a thick wax wad, and no lubrication on the bullet, just like a muzzle-loading bullet, with nothing upon it but the paper wrapper. The other has a compound wad of thin felt above the powder, and then a very fine ebonite wad, of which this is a specimen (*producing the same*); it is cut out of this (*producing the material*); it has very great cleaning power, that is to say, it is hard and keeps a good edge to clean away everything before it, and at the same time there is scarcely any friction in the barrel, it goes above the felt wad, and then the wax wad goes above that again, touching the bullet.

395. (*Mr. Ross.*) I suppose the ebonite wad is waterproof?—Yes, perfectly so. There are some here that I fired the day before yesterday, and you will find them very perfect (*producing the same*); these fell on the ground close before the muzzle of the rifle, taking the bottom of the wrapper with them.

396. Have you made sufficient experiments with these different kinds of cartridges to be able to determine which is the best?—I think it would be premature to come to a conclusion about it at present; I have been only twice out since Friday last. I fired some yesterday and the day before. I fired over 200 yesterday, trying if I could foul the rifle, but I found that these wads prevented it completely, so much so that the shooting was as good at the end as it was at the beginning.

397. Did you make any wild shots?—No. I will show you the diagrams.

398. You have made three or four experiments, I believe?—Yes, and these are the diagrams that were made the day before yesterday at 400 yards (*handing in the same*). The Committee will find that the vertical deviation is very small, and the lateral deviation is entirely in consequence of the wind. The other experiment that I made was with a compound bullet, which I have here to show (*producing the same*); the fourth was with a taper bullet, with a wax wad and an ebonite wad along with it, with no other wad, but simply those two. This is the compound bullet (*producing the same*).

399. (*Chairman.*) That, as I understand, is made of two different metals?—Yes. I have tried them with wax and without. These (*explaining*) are compressed in three pieces with a wad in the centre, that can be put at the base or near the apex.

400. (*Mr. Ross.*) What is this ring round the bullet?—That is the felt wad which is inserted and made solid with the bullet, and it cleans away everything before it. This (*pointing to the same*) is one without wax, of the same description. I find that the wax keeps the rifle rather cleaner than the lubrication I have employed, and which I am sorry I did not know sooner. This (*pointing to the same*) is one with the ebonite in front of the felt.

401. (*Chairman.*) Would not that sort of bullet be very much more expensive?—Not much; it is just as simple to make as the present Enfield bullet. After the present Enfield bullet is made they have to send it round a disc to get the plug put in, and this is just as soon put in as it. These are another sort of wads (*producing the same*) that I have used with wax and ebonite placed in the cartridge immediately below the bullet, and each of these four descriptions have given very excellent results. These are the diagrams (*handing in the same*) showing the accurate shooting that we made while a gale was blowing, which of course accounts for the lateral deviation; the fouling was very slight. I fouled the rifle by firing over 100 rounds with the old ammunition. I then put in one of these ebonite wads with a wax wad, and that removed the fouling at the second shot. I was then ready to go on for accuracy. I also tried a thick wax wad after fouling, and that did pretty well, but did not act quite so well as the ebonite and wax combined; but it is a very great improvement. Veneer or satin wood or box wood would do the same thing as ebonite.

402. Do you think it is a good plan to put paper round the bullet?—For a small-bore rifle I think it is,

because I am sure it gives greater accuracy, and prevents the lead getting on the barrel so much. With a small-bore rifle the friction is much greater from the bullet being more elongated than in the case of the large-bore. Even with the large-bore, without a great amount of lubrication on the bullet, it will leave a little lead in the barrel.

403. Would not that be prevented by using a bullet made of hardened metal?—Yes, and I am using it; this (*producing the same*) is a bullet that I prefer after being hardened to the extent of about 1 in 10; that has sufficient taper.

404. But you still require paper with a hardened bullet, do you not?—Yes, I think it is better to have the paper; the taper in the length of this is about one-hundredth of an inch.

405. Supposing you were about to make a new rifle, do you think twould be advisable first to make the barrel, and then contrive the ammunition to fit it; or have the ammunition first made, and then make a barrel to fit the ammunition. In the case of the breech-loader which is of the first importance, the ammunition or the barrel?—I consider them both of equal importance. I should think for accuracy to be maintained up to 1,000 yards the bore should not be less than ·447 and the bullet with the wrapper ·451 at the base,* because that gives $\frac{4}{1000}$ths of an inch for the base of the bullet to be larger than the bore. I consider ·447 is the *minimum* and ·457 the *maximum* of the bore, and the rifle ought to give good shooting at 1,000 yards with a 480 grain bullet. The fire from a 530 grain bullet would give a flatter trajectory at the end of its journey.

406. But not so flat as in the first 300 yards?—No.

407. With regard to getting a low trajectory and also accuracy at long ranges, what weight of bullet should you recommend?—I do not think that anything can beat 480 grains, to get as near as possible the medium of both.

408. Would it be possible, do you think, to make a gun to carry the lighter ammunition as well as the heavier; a good gun that would carry both?—Not for 1,000 yards.

409. I mean to carry light ammunition to fire at short ranges with a low trajectory and heavy ammunition to obtain greater accuracy?—I think it would be perfectly easy.

410. Do you not think it would affect the chambering of the gun by using a lighter bullet and a greater charge of powder?—If you made up the deficiency with powder the cartridge would still be of the same length. If you wished to make a very flat trajectory you would increase the powder and decrease the weight of the bullet.

411. For 1,000 yards would you diminish the powder and increase the weight of the bullet?—Yes.

412. Would you not in that way injure the shooting?—No; but you could not put so much powder into a cartridge with a 530 grain bullet as for a lighter one, because the strain would be too great on the cartridge—it would fracture the cartridge or the cap, and cause an escape of gas; 85 grains are as much as you can put in, but if you put a lighter bullet you can increase the charge without straining the cartridge any more than with a bullet of the full weight.

413. Do you still approve of your system of rifling?—Yes, with two more cuts; instead of seven I should put nine. That would reduce the angles, and still give great rotatory power, and cause the wad to keep the lands cleaner than with seven cuts.

414. Do you recommend that from theory?—No, from practice. I have made a couple of them muzzle loaders, but still the principle holds good in both muzzle and breech-loaders.

415. Do you think the same conditions would hold good with breech-loaders as with muzzle-loaders?—Yes. I think it is of more importance for breech-loaders, because loading at the muzzle with a lubricating wad always clears the way for the bullet, and allows it to come out of a clean barrel. In the other case (that is the breech-loader), from the effects of the discharge of powder which the bullet has to travel over, it is of more importance that the angles be reduced.

416. Have you tried any experiments with compressed powder?—No, I have not. I went to Colonel Boxer to ask him for some of his ·500 gauges, not that I think they will ever take the place of the ·450 gauges.*

417. What do you conceive to be the objection to compressed powder?—I really should not venture to give any opinion about it, because I have not tried it; but what I felt disposed to do was to try some of Ely's cartridges, the ·500 cartridges, against Colonel Boxer's compressed cartridges and against what I am making, viz., the ·450 gauge.

418. But you know nothing about cartridges made of compressed powder?—No, I can give no opinion about them.

419. I see that you use a solid bullet?—Yes.

420. How do you obtain its expansion into the barrel?—Any plug of lead will expand in a tube if it is of that length (*describing*), the length of the 480 grain bullet, or of the 530 grain bullet.

421. Are your bullets forced into the barrel, or are they actually larger than the barrel?—No, they would pass into the barrel with a little pressure, but the ignition of the charge causes the expansion; when the bullet receives, as it were, a blow at the base, it causes the expansion of the missile, and then it fits the barrel perfectly.

422. Do you consider that it is better not to force the bullet into the barrel?—Decidedly.†

423. Upon what grounds do you entertain that opinion?—Because, from the pressure of the gas, the expansion and friction would be too great.

424. Would you not have increased friction from adding to the angles in the twist by making two fresh grooves?—The friction will not be increased; by making the bullet taper it rather reduces the friction, because the forepart of it is not likely to fill the grooves so completely as it would if it were a perfect cylinder. It secures a rotatory motion by the base fitting well, the other part requiring to be sufficiently large to be steady, but nothing more. Besides that, having a wrapper on it, it is allowed to enter freely into the barrel without any tendency to be rubbed or ruffled.

425. Are you at all able to account for the occasional wild shooting which your rifle makes?—Yes. Of the 130 rounds that I got from the Committee to lubricate with wax, 11 were not fit to use—it was my people at home, who had been very careless—some of the brass of the cases was turned in, presenting a sharp edge to the bullet coming out, which must of course have torn the wrappers; the loading was very irregularly managed, one bullet had half the base defective.

426. Would not that be liable to occur if they were made in large quantities?—No, not if they were made by proper people; my people were not accustomed to making such quantities.

427. Have you turned your attention to the construction of locks, or any improvements in them?—No, nothing different from the usual lock, which I fancy is the best of all; other locks generally get much sooner out of order. Where there is a reduction of the number of pieces they invariably get quicker out of order. I have had many of them sent to me to repair.

428. What kind of locks have they been?—Top locks, and all sorts of breech-loading locks.

429. Have they been locks in which main springs were used?—Yes, in some cases the trigger acted directly on the spring, the latter acting upon the

* Hardened bullets are here referred to.

* In this answer witness was referring to the gauge not to the powder.

† This refers only to pure lead bullets.

Mr. A. Henry.

6 Feb. 1868.

tumbler, which was combined with the cock; indeed I could not enumerate the variety of them, but they have been always more troublesome to keep in order.

430. After the experiments you have made, what kind of lubrication do you prefer?—I should use pure wax.

431. You prefer that for shooting?—Not entirely; and if it was quite the same, I should prefer to add a little softer lubrication. I think that would be an advantage; but I have done so well with the wax that I do not think there is much cause for any addition.

432. (*Earl Spencer.*) The rifle that you sent to Wimbledon last year was not fully stocked, the wood did not follow the barrel the whole way. Do you consider that it was sufficiently stocked for a military weapon?—I consider that it was stronger than those which are fully stocked, because, instead of that little strap which is attached to barrels generally with full stocks, I have a long strap attached to a solid body going down the whole length of the handle; it is bound together by the breech-pin, in the crown of the stock, and there is another pin from the girder to the end of the strap of the breech, binding it together so solidly that I think it is much stronger than the other. Then the fore end has nothing to do with supporting it, as the barrel is screwed into a solid body. I am convinced that if it was put to the test it would stand more than the full stocking.*

433. It is not necessary, in your opinion, to have a piece of wood running nearly to the end of the muzzle to protect that part of the barrel?—Not quite to the muzzle. I do not think it is necessary to carry it further than that (*describing*).

434. Was there not some little difference in the lock of that gun?—Yes; there is détente, but it is not necessary; it could be done without.

435. Is not the détente an improvement?—Yes; but not so much for a 6 lb. pull; it is not necessary for that. If it was to be reduced to a lighter pull, of course it would become indispensable.

436. Does it cause any additional expense in the making of the lock?—A little; but it is very trifling.

437. You do not think that the wad you have spoken of in the middle of the cartridge would affect the flight of the bullet?—Not the slightest. There is a diagram to show the accuracy that was obtained, and that seems to be very good indeed (*handing in the same*); the vertical deviation was very trifling.

438. In the compound bullet, what lubricating wad do you use?—I should have a felt wad and an ebonite wad behind it.

439. You would put that wad in the middle to clean out the barrel?—Yes; it has that little piece of iron in the centre which gives more of a centrifugal motion to the bullet; it causes the rotatory motion to go on with less twist than without it, and I should say that it would give very great penetration.

440. Can you at all account for the fouling of the rifle near the muzzle, and not near the breech?—Yes; it was because there was not sufficient lubrication to lubricate the barrel all the way up; it was exhausted before it reached it. There is far too little on my bullets, and that is the cause of it; it is exhausted before it gets to that part of the barrel.

441. I think I have seen in Scotland rifles made by you for deer stalking, which were generally called "express rifles;" on what principle are they made?—The bullet has a saturated felt wad attached to the wrapper, and that keeps it very clean.

442. There is some other principle, is there not; you have a heavy charge of powder and a light bullet?—Yes; it is a hollow bullet, with a copper tube put in it, or a peg of wood, or beeswax.

443. Does that rifle give a low trajectory?—Yes; it carries a very light missile with a heavy charge of powder, and the velocity is very great at 200 yards; after that it falls very fast. At 250 yards it will hit a good bit below the object, but not up to 200 yards; the lightness of the missile of course accounts for it.

444. Up to 200 yards the crushing power of the bullet is very great, is it not?—Yes, very great; it makes an immense hole.

445. But it does not go through an animal as a heavier bullet would?—No, the great velocity prevents that.

446. The same sort of principle might, I suppose, be applied to a military weapon?—Just the same; the same twist would do if the bullet was proportioned for it.

447. That is to say, you could get with a heavy charge of powder and a light bullet a very low trajectory up to 500 yards?—Yes, up to that.

448. What would be the pitch of the twist you would prefer for the military rifle?—To use two kinds of bullets I should think it would require to be fully ·450 gauge, and to be 30 inches for both purposes.

449. With a turn of 30 inches?—Yes.

450. Would you prefer that to a turn of 20 inches?—Yes; 20 inches would be too quick for that length of missile.

451. If you got good shooting with a muzzle-loader under certain conditions, I suppose you feel quite sure you would obtain the same good shooting under somewhat altered conditions with a breech-loader?—I think so.

452. Not always, perhaps?—A missile that would shoot out of a muzzle-loader correctly would also do the same out of a breech-loader.

453. Supposing you had a barrel with a particular kind of grooving and bore that fired well as a muzzle-loader, could you make the same barrel shoot well with a breech-loader?—There might be some conditions different. If it was for quiet slow shooting the difference would be scarcely apparent, but if it was for rapid shooting I think there would of a necessity be some difference. In order to prevent fouling I do not think that a very short missile and a quick turn would do to shoot rapidly in the first place, and then to shoot for accuracy afterwards, because it would ride over the grooves.

454. For slow shooting you could make any rifle that fired well as a muzzle-loader shoot well as a breech-loader?—I think so, if the missile was reduced to the size of a deer-stalking missile. It would be too short I think for rapidity and accuracy combined, but, by adopting a medium-sized missile, I believe they could be obtained.

455. Was it entirely the fouling that made the rifle fail when used for rapid firing?—Entirely the fouling.

456. Whereas in a muzzle-loader every time you load you clean out the barrel?—Quite so.

457. (*Captain Mackinnon.*) Do you ever observe any effects of forward fire on your bullets, that is, the gas getting round the bullet and scoring it when it is in the barrel?—No.

458. You have, I believe, picked up bullets after you have fired them?—Yes, and they have always had the impression of the rifling perfectly upon them all. We have sometimes fired them into water, so as to prevent them being knocked about, and we have still found upon them as perfectly as possible the marks of the rifling.

459. With no marks of forward fire, such as scoring?—No, nothing else.

460. (*Captain Rawlins.*) Do you think that pure beeswax will foul the rifle more than any softer lubrication?—It will cause a higher trajectory, because there is more friction in it, and I think it is possible that it would be a little more foul with the beeswax alone than with a slight addition of grease of some description.

461. (*Chairman.*) Supposing more guns were required, say four or six, how long would you require to make them?—At this season of the year they could be made more quickly than in the summer season. I think they could be made in three months, but that would be quite short time enough to give.

* This refers to a stock constructed in two pieces, the butt and fore-stock being separate.

I think a little longer would be all the better, to enable us to try experiments.

462. That would be to perfect yourself in theory; but if you had made up your mind what kind of rifles were good you would not require to make experiments?—If I were to set to work to do that which I believe to be the best it could be done no doubt in less time. I should think in two months, or between two and three months, six rifles could be made, to be made carefully.

463. Supposing precise instructions were given as to the make of the guns, how long do you suppose it would take you, with no great peculiarities in them?—I think that three months would not be too long to do justice to them.

464. I believe you sent to us first more than one system of breech mechanism?—Yes.

465. From the experience you have gained, which system of breech mechanism do you prefer?—I prefer the present one which you have.

466. (*Earl Spencer.*) Does it ever happen, in your ordinary course of business, that a gentleman comes and says, "I want a rifle with your breech mechanism, but with a Whitworth barrel?"—No, that has not happened.

467. Supposing it did, could you carry out an order of that sort?—Not with the Whitworth.

468. Why not?—Unless it was 12 angles instead of six; the hexagon would not do for a breech-loader.

469. You could not apply the Whitworth barrel to your system of breech mechanism?—Not the hexagon barrel.

470. (*Captain Mackinnon.*) Could you do so in a manufacturing point of view?—Yes; we could put in any barrel to the breech; any barrel could be put to the body.

471. And *vice versâ*?—Yes.

472. (*Earl Spencer.*) Should you be at liberty to do so?—Yes, by paying a royalty.

473. Of how much?—About 1*s.* a gun.

474. (*Mr. Ross.*) Will you state to the Committee your reasons for preferring a small-bore to the present Government gauge?—Because it gives a much flatter trajectory and greater accuracy.

475. And better penetration?—Yes, and greater accuracy at a longer distance.

476. Is oil a good lubricant in a felt wad?—Yes; animal oil is the best of all.

477. Do you think it would stand extremes of climate?—I have had some of these cartridges sent to India, and they have come back again, and have done very well, but I cannot say much about that.

478. Do you think that having paper wrapped round the bullet is sometimes the cause of wild shots from the paper adhering to the bullet and making a sort of wing?—If the wax or lubrication is put up to the very end of the wrapper it occasionally sticks to it; but if about the eighth of an inch of the wrapper is not lubricated at all it comes away very freely.

479. I suppose your bullets do, to a certain extent, force their way from the chamber into the barrel?—Yes, they do slightly.

480. Where does the expansion take place?—I think the expansion takes place about 6 inches from the cartridge, or from 3 to 6 inches. I do not believe it is fully expanded the moment it leaves the chamber; I think it has entered into the rifling before the full expansion takes place.

481. (*Earl Spencer.*) Are you able to prove that?—We have had barrels cut down until we came to 2 inches, and it was found that it went out without any marking when reduced to a little under 3 inches.

482. Do not you think that it ever expands into the chamber when it is larger than the bullet?—In so very trifling a degree that I think it would be scarcely perceptible.

483. Then the act of forcing through the grooves can never take place unless the bullet is actually larger than the barrel?—Yes; but we do not make them larger, we make the bullets so that they will pass through with a little pressure.*

484. But I am speaking of other systems besides your own?—I believe that for the angles given by the hexagon or octagon form it requires to be a little larger, because the expansion would not be sufficient to fill those angles; but with my own the centre of the planes and the tops of the lands are cocentric with the axis of the bore, and the expansion is very trifling. In the cuts of my rifle there are double the number of points bearing upon that cylindrical missile; if there are seven cuts there are 14 points of bearing, giving the least possible expansion, and only that which is necessary to complete the fit of the barrel, and consequently restricting the missile to the very minimum of expansion, but still there is a very powerful rotatory motion. Both the lands and the angles have their work to do, but either of them is sufficient to give the rotatory motion to the bullet.

485. Have you formed any opinion upon Metford's principle of rifling?—I think it is a very nice rifle for a muzzle-loader, but I do not know how it might be for a breech-loader. I do not believe in a progressive twist at all. Any curvilinear or segmental cut must be more susceptible of injury than an angular cut, and would not stand the same rough usage. These very delicate grooves, segmental or curvilinear, are very easily spoiled at the muzzle, and when the first inch of the muzzle is gone the bullet wanders in a strange way; there is nothing to protect them from injury in cleaning, but with an angular cut they retain their form, and it is sufficient to guide the missile from the very muzzle of the rifle, even after it is considerably worn, but any other of these arms are more liable to get out of shooting, either the elliptical form or with a double ellipsis. Mr. Boucher's curvilinear cut is the best of that description yet made.

486. (*Mr. Ross.*) If you had a muzzle-loading rifle and a breech-loader with the same description of barrel, using the same kind of bullet, and the same charge of powder, do you think you could obtain as good results from the breech-loader as from the muzzle-loader?—Not quite, because the cartridge case acts somewhat like a cushion, and reduces the power, and therefore the initial velocity.

487. Will you be kind enough to explain that?—It is in this way: when the powder ignites the cartridge gives way, as if it was in a vacuum, and the yielding of the cartridge case to the chamber of the gun reduces the power of the charge.

488. You mean that in the first instance there is a loss of power in expanding the cartridge case to fill the barrel?—Yes.

489. (*Chairman.*) Are there any particular points that you wish to bring before the attention of the Committee?—I have here some memoranda which I should like to read.†

"Calibres and Twists."

"·577 bore, solid bullet	- 530	grains,	spiral,	4 feet.
"Do. do., hollow-plugged,	480	do.	do.	4 feet 4 inches.
"·500 bore, solid bullet	- 530	do.	do.	2 feet 6 inches.
"Do. do., hollow do.	- 480	do.	do.	2 feet 9 inches.
"·450 do., solid bullet	- 530	do.	do.	1 foot 9 inches
"Do. do., hollow do.	- 480	do.	do.	1 foot 10½ ins.

"Length of barrel 30 inches, and not exceeding 33 "inches, cuts in ·447 to ·457, 9 plains and re- "entering angles cocentrically with axis of bore; "the advantage of which is great rotating power "without causing any injurious distortion of the "bullet."

490. (*Earl Spencer.*) Why do you consider a short barrel best for a breech-loader?—I consider that a 30-inch barrel for a breech-loader and a ·450 gauge is better than a longer one; it should certainly not exceed 33 inches to get the best results from it.

* This refers to soft lead bullets.

† In his memoranda the witness stated that Capt. Fairholm's sights, as described in the "Volunteer Service Gazette" of 18th January 1868, were such as he would recommend for a military rifle.

Mr. A. Henry.
6 Feb. 1868.

491. For what reason?—Because, before traversing that length of barrel, the bullet has got all the benefit of expansion to the shape of the rifle; and the friction must be comparatively less if it has that three inches saved in travelling through the barrel; the charge will be perfectly ignited in that length. The bullet would go with greater velocity from a barrel 30 inches long than from a barrel of 33 inches; the fouling would probably be greater in the longer barrel.

492. Would not the lubrication retain its power?—Yes; but it would be more likely to be exhausted the further it travelled in a hot barrel.

The witness withdrew.

Adjourned till to-morrow at 11 o'clock.

War Office, Friday, 7th February 1868.

PRESENT:

LIEUT.-COLONEL FLETCHER IN THE CHAIR.

CAPTAIN RAWLINS.	E. ROSS, Esq.
CAPTAIN MACKINNON.	CAPTAIN HAIG, Secretary.
EARL SPENCER, K.G.	

Major G. V. Fosbery, V.C.
7 Feb. 1868.

Major G. V. FOSBERY, V.C., examined.

493. (*Chairman*). I believe you have had some experience on service in the use of shells?—Yes.

494. Where have you seen shells used?—They were used under my direction at Umbeyla, in the north-west of India.

495. In what capacity were you then serving?—I was directed to take charge of the marksmen of the force and make experiments with the shells.

496. Will you be kind enough to describe to the Committee what were the effects of the shells, and how you found them to answer during that campaign?—They were tried in the first instance to get the range for the artillery and infantry, and they were very successful in doing that. We were always able to determine the distance of our enemy, and to bring the fire, whether of shell or of plain bullet, upon them.

497. Can you mention any special instance where that was the case?—It occurred particularly in the action that was called in the despatches the action of the Conical Hill. The enemy were upon a hill at a distance of 650 yards, with a ravine between them and our mountain train battery. No one knew the distance, and I was referred to to ascertain the distance with rifle shells. I did so. The fuzes were cut, the shells prepared, and a fire was opened immediately from the mountain artillery, which proved so very destructive that a charge by one of the Punjaub regiments cleared the enemy out, and the thing was over.

498. Was any evidence given of the moral effect produced on the enemy by the shells?—So far so that the enemy sent in a flag of truce begging us to discontinue their use; and that small parties of marksmen armed with them were able to drive out much larger bodies of the enemy when once they open fire with shell; they dreaded their use.

499. How do you usually use them—in the same way that you would ordinary bullets, or only on special occasions?—Each of the men under my command had a certain number of the shells, and they used them when they were ordered to do so.

500. Will you be good enough to state with what objects they were ordered to do so?—Generally on first taking up a position, it was merely to ascertain the range of any parties of the enemy, but occasionally when they got troublesome and we wanted to produce a greater effect than could be produced by the rifle bullet.

501. On one occasion, I believe, you used them for repulsing an attack?—Yes.

502. What was the effect that you found produced when you afterwards examined the bodies of those who were killed?—Sir Neville Chamberlayne found it difficult to believe that the men had not been killed by the fire of artillery.

503. Did you find that you got equally good shooting by using shells as with the ordinary bullet?—I found that my marksmen always preferred a shell for a long shot.

504. Did you require a different sighting for the use of shell from that required for the ordinary bullet?—The sighting was as nearly as possible the same; a very trifling allowance was necessary for fine shooting; the weight or balance of the shell was as nearly as possible the same as that of the bullet.

505. If a shell was used, it was of importance, I suppose, that the weight should be assimilated?—Yes, knowing that the sighting for the shell and the bullet must be exactly the same.

506. Have you made any other use of shells besides that of obtaining distances for the artillery and infantry, or as a means of repulsing an attack?—I used them for surveying the whole position.

507. Will you describe to the Committee how you did that?—The ground was surveyed with a rifle and a compass. I got the distances of the different points on the opposite hill, and took the bearings with a compass and protracted the angles upon the distances, and so made a sketch map of the whole position.

508. That was occupied by the enemy?—Yes, showing their position and our own too.

509. Had you any means of verifying the sketch afterwards?—Yes, I verified it by comparison with the trigonometrical survey.

510. Did you find it correct?—I found that I was only 20 yards out in one range of 950 yards.

511. Have you found that there was any danger in carrying these shells of their exploding accidentally?—I have seen them used when the rifles were very foul, and it was necessary to force them home by repeated blows of the ramrod. I have used them in rough work, in a hurry, and always without accident.

512. Have you ever seen them used for breech-loaders?—Never.

513. I suppose there would be less risk in breech-loaders than with muzzle-loaders?—Yes, because there would be no ramming down.

514. Did you find the long range of the present rifles of much service in that campaign?—We would have been glad to have had rifles of still greater accuracy, and longer range.

515. That I suppose was especially with regard to skirmishers?—Especially with regard to the marksmen.

516. Referring to the other troops, what do you consider to be the chief requisites for a military arm?—Flatness of trajectory and sufficient accuracy not to discourage the men, but to throw as little as possible of the blame of a bad shot—the margin of error

in fact—on the gun, and to throw it all, or as much as possible, on the soldier, because we can improve him by training.

517. I believe you have been over to Vincennes several times lately?—Yes, I was over there lately.

518. Have you had any experience of shooting with the Chassepôt?—I have seen it fired; I have seen the troops practising with it.

519. What is your opinion as to that arm?—I believe it is not a very accurate arm, but the trajectory is wonderfully flat; the bullet seemed to go up to the target in a very short space of time.

520. Do the French lay great stress on the flatness of the trajectory?—Very great; so much so that they have sacrificed accuracy to a great extent to obtain it.

521. Up to what range?—Up to 1,000 metres; they calculate they have obtained it.

522. Have they used explosive bullets at all?—No, they have had the system of explosive bullets before them, but they are as yet undecided; they profess to be very much guided by our views on the subject.

523. Do you see any objection to the troops being supplied with explosive bullets?—None, except in the case of very short ranges, then a shell would have less effect than a solid bullet from want of penetration.

524. Did you ever find any evil arise from the want of penetration in those bullets in the campaign in which you served?—No, they seemed to produce greater effect than the ordinary bullets at whatever range they were used.

525. Have you made any experiments recently with rifles of different calibres?—Yes.

526. What is your opinion as to the calibre which would best answer the purpose of a military weapon?—I think that I can hardly answer that question without going into the reason of the thing. I believe that the calibre of the present small-bore rifle was decided by the weight of lead given to Mr Whitworth, viz. 530 grains, who was set to work to determine the best form of projectile, and he found that in a cylindrical projectile of 2½ diameters in length the lead was disposed in the best possible form, and such a projectile was found to be ·451 in diameter; he was limited to 530 grains of lead. Now we have reduced the weight of the bullet then supposed to be necessary, and the question is whether the same law does not hold good, and whether the calibre ought not to be reduced at the same time. The only difficulty in our way appears to be that of fouling.

527. Have you tried the ·451 bore and the ·500 bore in the same kind of rifles?—Yes.

528. With which did you attain the greatest flatness of trajectory and the greatest accuracy?—With the ·451.

529. Have you found any defects in that as compared with the other?—With the present arrangement of cartridge the fouling increases very rapidly.

530. To what do you attribute that?—To the insufficiency of the present method of lubrication.

531. Do you think that if a different description of lubrication was used, or more of it, you would get rid of fouling?—I think some special lubricating contrivance which would not be very difficult to design is required, and that a small-bore might then be made to keep itself clean up to as many shots as would be really necessary on service—say 100 or 120.

532. When you say that the accuracy of the ·451 bore deteriorated from fouling, after how many shots was that?—It began to be very perceptible after 40 or 50.

533. Were the shots fired with great rapidity, or in the ordinary way?—They were fired with considerable rapidity, so as to heat the rifle.

534. Would heating the rifle tend to produce fouling?—With the beeswax lubricator it is rather apt to have a contrary effect.

535. I believe you have tried cartridges made of compressed powder?—Yes, but quite lately.

536. How did you find them shoot?—I found them shoot with great regularity; they gave great accuracy, and seemed to be very satisfactory in every way.

537. Is not the strength of compressed powder greater than that of ordinary powder?—Yes.

538. Therefore a shorter cartridge can be used?—Yes, if only the compressed powder will answer for service.

539. Have you formed any opinion upon that subject?—I had a conversation with General Le Bœuf on the subject the other day, and he informed me that compressed powder in some form had been issued to several regiments in the French army, but that it had been found to give rise to great irregularities in the shooting, after it had been carried for some time in the soldier's pouch. The question, therefore, is what amount of rough usage compressed powder will stand in these cartridges. If it should succeed thoroughly and will stand knocking about, it is by far the best thing in every way, because of the way in which the cartridge is shortened, and the extra strength of the powder.

540. Were the cartridges of which the French general spoke paper cartridges?—Yes.

541. When you say that they deteriorate in the soldier's pouch, is that from damp or from being knocked about?—From what the general said, I understood it to be from rough usage.

542. Were the cartridges made with a chamber passing up them in the same way as those which have been lately made by Colonel Boxer?—I think not, but I am not sure.

543. Is there not a sort of gloss put over the compressed powder?—I do not know; I believe it to be simply powder compressed.

544. How do the grains of the powder adhere together?—If dry powder be compressed it will adhere of itself with considerable force.

545. You do not know that there is any gum used for the purpose?—I am not aware that there is.

546. (*Captain Rawlins.*) Have you ever fired any shell out of the small-bore rifles?—Yes, many times.

547. Did they give the same results?—I am speaking now of my own shell, not of the Metford shell. I have tried them in my own small-bore rifle.

548. Did you obtain the same result?—Yes.

549. Have you ever seen the Chassepôt fired at 1,000 yards?—No.

550. You do not know the elevation at that distance?—No.

551. Have you heard that it gives a very flat trajectory at 1,000 yards?—I believe that it does.

552. (*Captain Mackinnon.*) Do you think that the present length of the rifle is absolutely necessary for a military weapon, or that any harm would arise from its being made shorter if a shorter rifle was found quite sufficient for accuracy?—I think that as long as men fire in two ranks we could not conveniently shorten the arm very much without danger of accident unless the drill be altered; the question of the bayonet also comes in.

553. What weight of bullet do you consider necessary for a military projectile?—I think that 400 grains are quite sufficient.

554. For a low trajectory?—Yes.

555. And for accuracy also?—Yes, for accuracy up to 1,000 yards.

556. Have you formed any opinion of the comparative value of metallic and paper cartridges for military purposes?—I think that the disadvantages of the paper cartridge are so great that there is no comparison between the two. One very great disadvantage of the paper cartridge is, that a miss-fire necessitates the drawing of the ramrod for the purpose of getting the cartridge out, and it is then very likely to break up and clog the gun with powder.

557. You have stated that in firing with a small-bore rifle, after firing 40 rounds it got foul?—Yes, it fouled very rapidly.

558. Can you imagine any case in an action in which 20 rounds would be fired with great rapidity?—I have seen on one occasion the men exhaust their pouches after firing as rapidly as they could; but that is no doubt rare.

Major G. V. Fosbery, V.C

7 Feb. 1868.

559. (*Mr. Ross.*) You did not state how it was you were enabled to judge distances by means of the shells. I presume you saw them explode?—Yes.

560. Had you any difficulty in seeing the explosion at 1,000 yards?—I have seen it and heard it at 1,200 yards.

561. Are you quite satisfied that even at extreme ranges, say 1,000 yards, accurate shooting could be made with great effect in warfare with shell or bullet?—I do not believe that it would be a usual thing, but I believe the possession of a weapon which would enable you to bring an accurate fire to bear upon an enemy at 1,000 yards very important.

562. At what distance do you think troops would commence firing with the utmost rapidity in a general action?—At 150 or 200 yards.

563. At that short distance you would expect a great per-centage of shots to take effect?—Yes.

564. Under those circumstances, what number of rounds do you think each man in a regiment would be likely to be called on to fire with great rapidity?—From 10 to 15.

565. Do you think that troops armed with our present service rifle would be at a disadvantage if opposed to troops armed with the Chassepôt?—Decidedly.

566. For what reasons?—Owing in the first place to the great difference between the trajectory of the Chassepôt and the trajectory of our service rifle.

567. (*Earl Spencer.*) Were the shells which you used in the Umbeyla campaign your own shells?—Yes.

568. Will you be kind enough to describe to the Committee a little more precisely the method by which you judged the distance?—Suppose that I wished to ascertain the distance of a hill opposite to me, I should choose some piece of ground, a rock, or other conspicuous point, which would give me a fair idea of the line. I should then judge the distance as nearly as possible, and graduate the sight for that distance. I should fire and watch the explosion of the shell, and if I found it too low I should raise my sighting until the shell dropped on to the exact spot. I should then read off the distance on the sight of my rifle.

569. Then it is, in fact, done by the sight of the rifle?—Yes, it is a tentative process entirely.

570. Have you ever tried compressed powder in a sharp frost?—No.

571. In a military point of view, do you attribute much importance to the strength of the barrel in your rifle?—I think the barrel ought to be strong enough to enable the bayonet to be used freely without bending it.

572. Do you think the present barrel is sufficiently strong to stand the rough usage of the service?—Not the Enfield barrel; but a barrel of the same thickness if of steel would be.

573. Do you think that there would be great advantages in a steel barrel?—Yes, immense advantages.

574. You have, I believe, considered the question of the lock in the military gun?—Yes, I have designed a lock for my own arm.

575. Do you think it would be an advantage to simplify the present lock?—I think that if a central-fire cartridge is used, which requires for its ignition a blow delivered in the axis of the barrel, that that blow should be as direct as possible.

576. (*Chairman.*) If you were to fire these shells out of a small-bore, would there at a long distance be sufficient explosion to mark the place where the shell fell?—Do you mean with my form of shell?

577. Yes, and with the ·451 bore?—Yes.

578. (*Captain Rawlins.*) You stated just now that you had seen on service the men's pouches emptied; do you know how many rounds they had to start with?—Each man had 53 rounds in his pouch, and I served out to 26 men 500 rounds of additional ammunition, a large part of which was also used.

579. (*Mr. Ross.*) Was that number of rounds fired with great rapidity?—In about four hours.

580. (*Captain Mackinnon.*) My question was whether the men fired as quickly as they could?—Every round was not fired successively with rapidity, but every now and then, when an attack was made, they fired as quickly as possible.

581. (*Mr. Ross.*) And then again they would cease firing?—Yes, but there would not be an entire cessation of firing.

582. (*Earl Spencer.*) Have you ever made any calculation as to the per-centage of shots that take effect in an action?—On one occasion I did, and I found that we placed *hors de combat* one man for every 12½ rounds of ball-cartridge.

583. At what distance were you then firing?—At distances varying from 35 yards to 500.

584. (*Captain Mackinnon.*) Were the men who did that picked marksmen?—Yes.

585. Have you seen any of the stocks made on the American principle in two pieces; if so, are they strong enough for military purposes, or is it necessary to have a long stock as in our service?—I think the stock should reach up as near to the muzzle as possible.

586. Do you think it should be in one piece or two?—I think in one piece. I think that a divided stock is always liable to work, sooner or later.

587. (*Mr. Ross.*) I suppose you could depend upon the men, if they found the rifles very foul after firing 100 rounds, cleaning them out?—Yes.

588. You think there would be no difficulty in cleaning a rifle after it was fouled?—None.

The witness withdrew.

Col. Haliday.

Colonel Haliday (Inspector-General of Musketry) examined.

589. (*Chairman.*) I believe you are now Inspector-General of Musketry?—Yes, I succeeded General Hay.

590. You were at Fleetwood for some time?—Yes, for rather more than three years as commandant.

591. When did you succeed General Hay at Hythe?—Last October.

592. Will you be good enough to give the Committee generally your opinion as to the principal requisites of a military arm, with regard to the value of a low trajectory and also of accuracy?—The value of a low trajectory can scarcely be overstated; it is one of the most important requisites for a military arm, next of course to accuracy, but the weight of the arm should not exceed that which a man can carry without distress.

593. When you say that a low trajectory is next in importance to accuracy, at what range do you mean?—Of course it is desirable that we should have as long a range as possible, at least so far as a man's eyesight goes. I do not know that there is any advantage in trying to obtain great accuracy and carrying it beyond that at which an ordinary man's eyesight will enable him to distinguish the object he wants to hit. That is of course really what regulates accuracy of shooting at long ranges, but the majority of men have not eyesight to distinguish small objects at great distances.

594. Should you consider a low trajectory up to 500 yards a greater requisite for military purposes than extreme accuracy at 800 or 1,000 yards?—I should call 500 yards rather a limited extent. I should desire to carry it beyond 500 yards, because in the case of infantry being attacked by cavalry it is obvious that it is very desirable to be enabled to throw in such a quantity of shot as will cripple or disable that body of cavalry at a distance somewhat beyond 500 yards. I should carry it to 600 or 650 yards.

595. Supposing it was necessary to sacrifice extreme accuracy at long ranges in order to obtain a low trajectory up to 500 yards, which do you consider the most important for a military arm, or can you form a comparison?—When you speak of long

range, I presume you mean beyond 800 yards and up to 1,000?

596. Yes.—I should say in that case that it is of more importance to have a low trajectory up to 500 yards than to have great accuracy at distances exceeding 800 yards, or from 900 to 1,000.

597. With regard to the weight of a rifle, what do you think ought to be the weight of a service arm?—I think it should not exceed the weight of the present converted Enfield or Snider, because it tells very much upon a man in a long day.

598. With regard to its length, do you think it could be shortened, supposing the shooting qualities to be equally good for a military arm?—Unquestionably so.

599. Would there not be some danger, if the men were firing in two ranks, of the front rank man being injured by the fire of his rear rank man?—I think that that can easily be obviated by the front rank kneeling.

600. But if both were standing, might there not be danger?—Yes; but the danger in reality would be rather of one man hitting the weapon of the other than of shooting or injuring him.

601. Would there not be a danger of hitting the front man's fingers?—Scarcely so. I do not think that that would occur. The accidents which I have known to occur have been, generally speaking, the blowing off one of the bands of the rifle of the front rank man or striking the barrel of the rifle of the front rank man. When in the act of loading the soldier cants his barrel slightly to the right, and if he elevates the muzzle too much it may come exactly in the way of the bullet of the rear rank man.

602. I suppose you would consider a rifle by which you could attain a lower trajectory than with the present arm a desirable one to have in the service?—Yes, decidedly.

603. And also one with which you could attain greater accuracy than with the present arm?—Certainly, the greater perfection you can attain in that way the better; an arm of course is equal in the hands of indifferent shooters, but it is desirable to have one in which the most experienced shots or sharpshooters could use, if it were necessary to have picked men to fire into embrasures.

604. A low trajectory would apply to all?—Yes.

605. To obtain a rifle with a lower trajectory, and which would give greater accuracy—not exceeding 9 lbs. 8 ounces in weight—what bore would you recommend?—I should not be inclined to go very much below the present. I think we might reduce the present a little. I should say to about half an inch, but I should not be disposed to go much below the ·500.

606. Would the ·451 bore be too small?—I am a little averse to express a decided opinion, because there are so many points connected with it. Crippling the enemy is not the only thing we have to think of.

607. What objections might there be to a bullet of those dimensions?—One objection to reducing the diameter very much is that you must have a bullet of a certain weight to carry sufficiently far; if you elongate it too much it seems to me that it would involve a mechanical difficulty in breech-loading.

608. That would be applicable to the present Snider?—Yes; and, as far as I can judge, to any system of breech-loading, even if it were not attended with other disadvantages.

609. Supposing that that difficulty could be obviated—I mean the difficulty of extraction—do you see any difficulty in a military point of view to a bullet for the ·451 bore?—No, I cannot say that I do, but I think one may perceive that a bullet of small dimensions is not likely to make a serious wound, and it may not soon cripple a man; of course it is not so likely to inflict a serious wound, or to cause much loss of blood. I think if you reduced the diameter of the bullet much you might have a great many men wounded in action, but who would not be crippled seriously for a length of time.

610. Have you had much experience on service?—No, I have not been in service at all. It has been my misfortune never to have been in active service. *Col. Haliday.* 7 Feb. 1868.

611. Have you formed any opinion with regard to the best twist to be given to rifles?—Yes; and I think that the present Enfield has too slow a twist—the long Enfield; we, generally speaking, consider the Naval rifle, which has a quicker twist, superior; one turn in 4 feet, I think, is superior to one turn in 6 feet 6 inches.

612. With regard to an increasing twist, have you any opinion to express upon that point?—I should be disposed to doubt the value of an increasing twist. I am aware that it is adopted in the Lancaster rifle, but I have never been able to satisfy myself of the advantage of it in a barrel of sufficient length. I can conceive that in pieces of ordnance and in barrels of contracted length there may be an advantage. In these the increasing twist creates greater friction and confines the bullet somewhat longer, and thereby to a certain extent compensates for the shortness of the barrel; but I see no advantage in it where the barrel is of sufficient length to give you the full force of the powder, and to ensure that all the charge shall be burned.

613. Have you seen any comparative trials made between the Whitworth, the Metford, and the Lancaster systems of rifling?—No, I have not witnessed any experiments made with those arms specially.

614. Do you know anything of the shooting qualities of the Lancaster arm with elliptical bore?—We have occasionally had men—the Engineers—armed with it, and I have heard officers of the Engineers speak of it. Captain Lempriere, who was one of my Captain Instructors for some time at Fleetwood, was an officer in the Engineers, and to the best of my recollection his opinion was that it was liable to what we call strip, and it was occasionally wild in shooting.

615. With regard to the bullets, have you turned your attention much to the shape of them, or their composition, their weight, and the necessary charge of powder?—No, I have not much. I have not yet had an opportunity of doing much in the way of experiments, but I think one thing is quite clear, namely, that we cannot dispense with the leaden bullet. I do not think that the mechanically fitting bullet of hardened metal has sufficient advantages to induce us to give up the other.

616. Your objection would be to the mechanical fitting of the bullet, and not to the composition of the bullet?—No, provided we can obtain a metal at once ductile so that the bullet will take from the explosion of the powder the shape of the grooving and have sufficient weight; that, of course, is the difficulty.

617. You spoke just now of one possible objection to a small bullet, that the bullet would not make a sufficiently bad wound; have you ever tried any of the explosive bullets?—No, I have not; but I have heard that in shooting large animals the explosive bullet is very destructive and effective.

618. Have you seen anything of repeating rifles?—I have seen the Spencer repeating rifle; we had one of them at Fleetwood about 18 months ago, and we fired sometimes with it.

619. How did that work; did it in any way get out of order?—No, it did not get out of order there, because in point of fact it was only tried as a sort of amateur affair. But I am convinced that as an arm for the service it would be quite useless, it would be difficult to keep it in such order as that the action would work, I mean the joints necessary for protruding the charge; and the whole plan appeared to involve the necessity of such perfect cleanliness to avoid friction—such a high state of perfection in all the parts. I think it could never be expected to be useful as a military arm. In a very dry climate and as a sporting arm it might answer, but I do not believe that as a weapon for military purposes it is of any value.

620. You have not perhaps made any experiments or seen many of the new descriptions of locks and rifles?—No, not many. I know the Chassepôt and

Col. Halliday.

7 Feb. 1868.

the Prussian needle gun, and I have seen the Carter and Edwards lock.

621. Have you formed any decided opinion whether those descriptions of locks are an improvement on the present lock, or the contrary?—The extreme simplicity of the Carter and Edwards strikes one as giving an advantage, but I am by no means satisfied about the safety of it at present; the only one that I saw appeared objectionable on that point.

622. (*Captain Rawlins.*) Have you had anything to do with cartridges made of compressed powder?—I have not seen them.

623. Have you witnessed any shooting with the Chassepôt rifle?—The only experiments that I have seen performed with the Chassepôt were under these circumstances: an officer who came to go through the last course at Hythe brought one of those arms, I fancy, for his own amusement, and he tried its shooting against another officer who had a Carter and Edwards, but neither of them made good shooting, and the Chassepôt was constantly getting out of order.

624. (*Captain Mackinnon.*) Different opinions are entertained as to whether the bullet should be very heavy or of moderate weight; what weight of bullet do you consider necessary for a military rifle?—I think it should not be a very heavy bullet, and for this reason, that it would add so much to the weight a man had to carry.

625. But I mean as to the trajectory. What weight of bullet should you prefer with a view to crippling the enemy?—I should say not much under 500 grains.

626. Is there any relative proportion between the diameter and length of that bullet of 500 grains that you think would be a proper proportion for flight?—I have not formed any decided opinion upon that point. The principal objection, I think, to a very elongated bullet is the difficulty with regard to the loading—the insertion.

627. Do you think it would be detrimental in the service to have two sorts of ammunition, with the same length of cartridge for the same arm; one being suited for accuracy at long ranges, and the other for a very flat trajectory at short ranges?—For general purposes on service, I think one could scarcely expect that a soldier would attend to the distinction between the two, unless he was equipped with two different pouches.

628. I am referring rather to a certain number of picked men being armed with them?—Then I see no objection to the introduction of such a thing, if such a thing can be obtained.

629. Have you seen any of the American guns, with the stock in two pieces?—No, I have not.

630. Supposing line firing was opened, how many shots do you think it would be necessary for a man to fire with great rapidity in action to create an effect, supposing the fire to be opened at 300 yards, and having reference to fouling?—Very much depends upon the accuracy of the shooting. Soldiers at present, I think, have been accustomed to rapidity, and to care so little about accuracy of aim, that I am disposed myself rather to deprecate that striving for rapidity, because I believe that if the men really fire tolerably well, five or six rounds from each man ought completely to annihilate any enemy you are opposed to, that is, at short ranges.

631. You have practised probably both with paper cartridges and metallic ones?—Yes.

632. Do you give any decided preference to one system of cartridges over the other?—I certainly think that a cartridge which you can blow out entirely without the necessity of extracting the base has an advantage over the other.

633. But I mean with reference to service to which English troops are exposed in all climates, to stand exposure and very rough work, and to be stored perhaps for years?—Taking all the points into consideration, I am disposed to prefer the metallic cartridge as it is at present constructed; it keeps remarkably well.

634. (*Mr. Ross.*) Do you think that long-range shooting in the case of well trained soldiers would be effective in service?—No; I do not believe in the practicability in action of much long-range shooting.

635. Not in the case of skirmishers?—No, not even with them. The value of long-range shooting, I think, is in the attack of works, in firing into embrasures, and in keeping down the fire of horse artillery.

636. I spoke of the service generally?—It is valuable, of course, in that particular point; in keeping down the fire of horse artillery it would be a very important thing.

637. (*Earl Spencer.*) You were talking of the effect of heavy bullets, but do you not think that a light bullet, with increased velocity, may produce very nearly the same effect as a heavy one?—I should doubt it.

638. Have you never seen heavy charges of powder and light bullets used in game rifles?—No. I can conceive that a bullet of small diameter might very easily go through the fleshy part of a man, and do him so little harm that the man after a short time might be able to come to the front again. But there is another question. I do not think it is at all desirable if you have an army in the field, and supposing that you defeat your enemy, that you should have to look after a great number of wounded men of your enemy, for it may be as great an inconvenience to you as a great number of wounded men of your own.

639. You seem to fear that the bullet might pass through a man and not make a sufficient hole?—Yes.

640. If the same effect could be produced by increasing the charge of powder, then you would see no objection to it?—That is the question. The orifice made by a small bullet, I think, is likely to be much less effective in doing more than temporarily crippling a man.

641. Have you never seen experiments tried with heavy charges and light bullets?—Eexperiments have been tried with regard to the penetration into wood, but its effect upon a man, I think, is a different thing. I have not seen it tried upon game.

642. Have you seen many of the muzzle-loading Whitworths that were issued some time ago in the service?—When I was at Fleetwood we frequently had a detachment of some of the corps armed with the Whitworth, who fired with them.

643. What was your opinion with regard to them?—They were objectionable on the point chiefly of loading; after a few rounds had been fired they fouled. There was then difficulty in getting the bullet down, and on one occasion an accident occurred to one of the men owing to that, and I found on inquiry that it was a common thing with the men of the 60th and others who were armed with that rifle, when they had fired a round or two, in order to get the ramrod down, to take hold of the cuff of their coat and get it between the man's hand and the top of the ramrod; and in one instance, in the case of a man who had a tight coat, the sleeve slipped when he was pressing it down, and the ramrod went through his hand. I found that the men were always loading in that way; that they constantly used the sleeve of the coat to get it on the palm of the hand; and in fact sometimes two men were obliged to go to the ramrod.

644. Did you observe whether those arms had been made at Manchester or at Enfield?—No, I cannot say that I noticed that, but I think that these arms were always Enfield arms.

645. Have you seen that Report upon the Whitworth rifle (*handing the same to the witness*)?—No, I have never seen this before.

646. It seems difficult to account for some reports of the Whitworth being so favourable and some pointing out the very defect you have named, and if you could have explained that the Committee would have been glad to have your opinion?—I cannot explain it. I had also an officer of the rifle brigade for some time with me as a subaltern instructor, who had been instructor to his battalion in the Mediterranean, and he stated that they had not found that difficulty as to

Col. Haliday.

7 Feb. 1868.

the loading out there. I can scarcely account for it. I can only suppose that in different climates and temperatures the amount of fouling is different, or that it sticks more to the barrel, and creates more difficulty in loading in some cases than in others.

647. Did you refer just now to Mr. Markham?—Yes, he was with me for six or seven months.

648. I find that there are two reports from the very same place—from the Curragh; one is favourable and the other unfavourable. Can you at all account for that?—No, I cannot conceive but that there should be difficulty experienced, because the complaints of the difficulty have been so numerous; from all quarters I have heard them, and therefore I do not believe them to be imaginary. I know that the officers of the 60th told me that their men were constantly obliged to resort to the expedient I have mentioned to force the ramrod down.

649. And that was in consequence of the fouling?—Yes.

650. Did that deteriorate the shooting very much?—No, I do not think it did; any deterioration experienced was in the rapid firing, in the file-firing then practised. Of course any mechanical impediment in the way of loading would cause a serious delay.

651. That of course would be obviated in a breech-loader?—Yes; the rapidity of fire to be obtained with it is something wonderfully different from the other.

652. (*Chairman.*) I believe that the men who used the Whitworth were handicapped?—Yes, they had to make more points for some time, and they complained very much, and General Hay subsequently reduced the number of points to be made in consequence of the complaints made about them.

653. Do you think that the being too heavily handicapped may have rendered the men averse to their weapon, and therefore being prejudiced against the new weapon they exaggerated its defects?—No, I do not think that was the case, nor am I aware that the men disliked the weapon. The difficulty I have referred to was mentioned to me by the officers because it had been noticed by them, but I never heard any of them say that the men complained of the weapon, or that they disliked it.

654. (*Mr. Ross.*) Upon the whole were the results as to accuracy better from the Whitworth than from the Enfield?—Yes, especially at long ranges. I do not conceive that it gave any superiority at short ranges. If the distance was beyond 450 yards, unquestionably it did, and they continued to fire at longer ranges after the extreme ranges for the Enfield were reduced by 100 yards.

The witness withdrew.

Mr. J. H. Burton.

Mr. James H. Burton examined.

655. (*Chairman.*) You have had great experience, I believe, in the manufacture of military weapons?—Yes, I believe I may say so with propriety.

656. You were engaged in bringing over the machinery from Springfield to Enfield some years ago?—Yes, I was. Before the machinery was brought to England, at least a considerable part of that which was ordered from the States, I was engaged for upwards of a year in adapting it to the Enfield rifle; and after I came here with the machinery, I took charge of the technical management of the Enfield factory and put it into operation, and remained there five years.

657. Since that time, I believe, you have gained great experience during the recent war in America in the machine department at Richmond?—Yes.

658. What position did you hold?—My official title was Superintendent of Armouries.

659. Were you engaged in making arms at Richmond in the armouries there?—Yes.

660. In order to obtain the best description of military rifle, which do you consider to be the first requisite, the ammunition, the barrel, or the breech mechanism?—By all means the ammunition and the barrel.

661. Is it better to fix upon the ammunition first and then make the barrel, or make the barrel first and then the ammunition?—The two must be worked out together.

662. You think that each influences the other so much that they cannot be separated?—Quite so; they are intimately dependent upon each other, and unless there is perfect harmony between the two, no satisfactory results will be obtained.

663. With regard to the barrel of a rifle which is to weigh not more than 9 lbs. 8 ounces, what bore do you think is best adapted for military purposes; that is, to obtain from it a low trajectory as well as accuracy?—An answer to that question would involve other conditions which you do not specify in your question.

664. Will you be good enough to mention those conditions?—Our own Government have laid down that pure beeswax shall be the lubricant, and that is an important question as connected especially with small-bores, because a difficulty has been encountered heretofore in getting a small-bore to perform well, so that it would not foul, using simple beeswax as a lubricant, and therefore that becomes an important question as connected with small-bores; independently of that I should say that you might go as small as $\frac{45}{100}$ths of an inch; you would flatten the trajectory and obtain greater accuracy, and of course higher velocity, because a flat trajectory means high velocity, and, with a proper combination of projectile and barrel, accuracy also.

665. The question of lubrication being for the present set aside, do you consider that a ·500 or a ·451 is most suitable to obtain a low trajectory and accuracy?—Independently of all other considerations, I should say ·451 calibre: but there are other important questions.

666. Will you be good enough to name them?—There is the length which the column of powder occupies in the barrel, when simple powder or uncompressed powder is used. I think that that has something to do with the fouling of small-bores. I think that a portion of the column of powder, before it becomes ignited, is driven up through the barrel, that is to say, it has not time or space to be consumed as quickly as it has in a larger bore.

667. Do you think that that is the principal cause of fouling in small-bores?—I am inclined to think that it is.

668. From the experience you have had lately, do you think that compressed powder will be applicable for military weapons?—I quite think so.

669. Have you tried many experiments with the cartridges which Colonel Boxer has lately made of compressed powder?—I should, perhaps, not say many, but I have tried a considerable number, and I have obtained very excellent results.

670. Supposing that compressed powder was found applicable to cartridges, and that, therefore, you could have a shorter cartridge than is at present used for small-bores, do you still consider that ·451 would be the best bore, or would you recommend any other?—I think that the ·500 bore will fulfil the largest per-centage of essential conditions, looking at the manufacture, and the whole question from beginning to end.

671. Putting aside the question of the wax and the question of long cartridges, the $\frac{1}{2}$-inch bore you think is the best?—I do.

672. I think you gave the facility of manufacture as one reason why the $\frac{1}{2}$-inch bore is the best; but would there be any greater difficulty in manufacturing a barrel of ·451 than of ·500?—I think there would be some little; but with reference to the bore, I think it is obvious that it would be more difficult to bore a small hole, say, the size of this quill, through a barrel 30 inches long, than a hole of half an inch in diameter.

673. It would be, I suppose, more difficult to make a number exactly alike?—No; it is getting the hole

Mr. J. H. Burton.

7 Feb. 1868.

drilled concentrically through a cylinder of steel, presuming that they are drilled.

674. Ought such a difficulty as that, with our present machinery, to have an influence in deciding the question between ·451 and ·500, considering the excellence attained in this country in machinery?—The drilling of steel barrels in this country is comparatively a new process; it has only been introduced within the last few years. There was never, during my experience at Enfield, anything done at it; it is since I left Enfield that something has been done there, but not to any very great extent, I am informed.

675. With regard to flatness of trajectory at 500 yards, do you believe that as flat a trajectory could be procured from a ½-inch bore as from a ·451 bore?—I think it could with compressed powder and a suitable bullet.

676. Would not the compressed powder influence the ·451 just as much as the ·500?—I do not think you can get what is technically termed the powder pellet in as good a shape with the ·451 calibre as with the ·500 calibre, with reference to the perfect combustion of the powder.

677. Therefore I suppose you mean that in a great many shots the shooting would not be so regular from the ·451 as from the ·500, using compressed powder?—That is my impression.

678. Would the trajectory be as low with the ½-inch bore as with the ·451 bore, using compressed powder?—It might not be quite so low at long ranges.

679. With regard to accuracy at longer ranges, should you always get the same accuracy under the same circumstances with the ½-inch bore as with the ·451 bore?—It may be questioned. I have some diagrams which show some of the results I have obtained at 500 yards with the ·500 bore, using compressed powder; they also show the angle of elevation at which the arm was fired, in a mechanical rest.

680. With regard to the twist, and take now the ½-inch bore, what length of barrel would you advise with reference to shooting qualities?—The actual length of the barrel would be dependent somewhat upon the length of the breech action; a long breech action would, of course, take up more of the length of the entire arm than a shorter one, and, consequently, would diminish the proportionate length of the barrel.

681. For shooting qualities only, what length should you say would be the best?—I should say about 36 inches, inclusive of the breech action.

682. What description of rifling do you think would be the best?—In my own experience I have found what is called the rounded groove to give the best results.

683. Is that the Metford principle?—I am not aware, for I do not know what that is. The groove I use is a segment of a circle smaller in diameter than that of the bore of the barrel, leaving between each two grooves a narrow line of that description (*describing*); the form of groove presents no re-entering angles in which fouling can accumulate, which is a desirable end to obtain.

684. What twist would you give?—I have found in a ·500 diameter that from 36 to 42 inch pitch gives the best results. I have tried both, and they both seem to give about equal results.

685. Do you consider an increasing twist good?—No, but an uniform twist, decreasing the depth of the grooves from the breech to the muzzle, gives the best results.

686. Why do you have a decreasing depth of grooves; is that to do away with friction?—I find that in practice its gives better results. I think it has something to do with keeping the barrel clean.

687. Then with regard to chambering the rifles. I suppose there is no doubt that all breech-loaders require a chamber?—None.

688. How far do you think that a bullet ought to project beyond the chamber into the rifling, or ought it to project beyond the chamber?—I do not think it is essential that the bullet should—at least the cylindrical part of the bullet—enter the rifling or the barrel itself, provided that the chamber is so contracted as to hold the axis of the bullet cocentrical with the axis of the barrel.

689. Do you believe that the bullets are expanded into the barrel, or are they simply forced through?—My impression is that the bullet is expanded the instant it receives the impact of the explosion.

690. Therefore, in all cases where there is chambering there must be forcing as well?—Yes, and that involves a very nice point; even a change of powder will throw the shooting off. A slower burning powder will not expand the bullet so much as a quicker burning powder, because the bullet does not receive so sudden a blow with slow burning powder.

691. You do not think that a bullet expands after it has received the first blow and as it is passing down the barrel?—No, I think not.

692. Then with regard to the make, speaking now of the ½-inch bore, do you consider it is necessary that the bullet should have a cup at the base to obtain expansion?—I should not be justified in saying that it is necessary; but so far as my experiments have gone, better results have been obtained with a bullet in which there has been a cavity and a plug.

693. Do you think that that is better than having a solid bullet, as far as you have seen?—I should say that I know better results have been obtained in that way, and of course I should say it is better.

694. Do you approve of the shape of the bullet which Colonel Boxer now makes with compressed powder, it is a hollow bullet?—Yes, with a baked clay plug, similar to that which is used in the regulation ammunition.

695. There is no plug at the end I think?—No, it is closed over; there is a cavity in the fore end; the bullet is closed over, which serves the same purpose as though the whole were not closed over, but filled up with a wooden plug, the object of which is to fill up the cavity, and the object of the cavity is to establish the centre of gravity at the most desirable point.

696. Have you turned your attention much to cartridges?—I have had to consider the question pretty closely in connexion with breech mechanism.

697. Do you approve of the copper cartridges used in America, speaking still of the ½-inch bore?—The copper cartridges which have been made in America, so far as my observation extends, have never been devised for carrying such a high charge of powder as is required in Europe, and my experience has convinced me that a copper cartridge, if made long enough to contain, say 70 grains, becomes both expensive to make and unreliable as to strength.

698. Is not that the fault of the material used, the copper?—Yes, to a very great extent it is, and the difficulties have been very great, which the manufacturers of copper cartridges have had to contend with in always getting the material of a proper character.

699. Then with regard to rim and central fire, which do you consider the best?—Central fire.

700. What are the objections to rim fire?—The objections to rim fire are several: in the first place, to make a copper cartridge with a rim weakens that portion where the flange is thrown out, and that is the very portion which requires the greatest strength; but into that weakened portion you put a large quantity of fulminate, which when distributed all round the rim increases the probability of that portion of the case being ruptured in the explosion. We know the nature of fulminate, and that it is very bursting in its effect when exploded.

701. Have you formed any decided opinion as to which are the best for a military arm, metallic cartridges or paper ones, as in the Chassepôt?—A metallic cartridge, by all means.

702. Supposing you use a metallic cartridge with a half-inch bore, what charge of powder and weight of bullet should you consider the best?—I have used 70 grains of powder compressed, which is equivalent to 80 grains uncompressed in its propellant force, and 380 grains of bullet.

703. Do you believe that those are the best proportions ?—I think so.

704. Have you ascertained conclusively that the compressed powder is so much stronger than the uncompressed ?—The principal evidence I have had of its increased strength, when compressed, has been in the flatness of the trajectory and the lowness of the angle of elevation at 500 yards. I have tried it alongside and against cartridges made up with uncompressed powder, and there is a very marked difference in the angle of elevation between the two in favour of the compressed powder, firing from the same gun.

705. How could you fire them from the same gun if there was a difference in the length of the cartridge ?—The uncompressed powder occupies more space, but for the purpose of experiments the bullet can be put more or less into the case of the cartridge.

706. Therefore there is no impossibility in having a rifle made that would fire both compressed and uncompressed powder for the purpose of experiments ?—I should not advise such a course. I should advise the making of a chambered rifle for each experiment ; you would then have the same relation of the bullet to the chamber and the bore of the barrel in each case.

707. In ordering barrels it would be almost necessary to specify the length of the cartridge you wished the barrels to be made for ?—Yes, if they were to be ordered chambered.

708. Could they be ordered unchambered and be chambered afterwards ?—Yes, without difficulty. I always order my barrels simply bored and rifled. The chambering I have done after I receive them.

709. That is to say, you cut away the lands in chambering ?—Yes.

710. With regard to the durability of compressed powder, do you know whether it is as durable and as little liable to injury from damp as the other ?—Of course so little time has elapsed since the idea was first brought forward that no opportunity has been had to establish that fact, but my own impression is, that it would be less subject to deterioration from damp than the uncompressed powder.

711. Do you see any objection to a harder metal being used than hardened lead for bullets ?—Of course the hardness of the lead has a direct influence upon the expansion of the projectile, and it would be very easy to harden a bullet to such an extent that it would not expand at all, at least perceptibly.

712. Then in that case you would use, I suppose, forcing without expansion ?—Yes ; what we call, technically, slugging.

713. Do you see any objection to slugging ?—I have never got such satisfactory results from a slugging as from an expanding bullet.

714. Have you ever seen any of Metford's or Fosbery's shells tried ?—I saw Mr. Metford try some of his shells when he first devised them, during the Crimean war, I think.

715. Not since then ?—No.

716. Were they used during the American war at all ?—To a very limited extent ; only with a few special arms that were obtained from here for very special service.

717. Were any repeating arms used during the American war ?—The Southern army were not able to obtain repeating arms, and during my identification with the Southern army my experience of repeating arms was very limited.

718. Supposing that rifles were required for further experiments, what do you think would be a fair time to allow to gunmakers to make them ?—That would very much depend upon the conditions laid down. If you gave the maker the barrel and the cartridge, and all the elements of shooting worked out, you would relieve him very much ; but if he has to go into experiments with a view to working out the shooting of the arm, of course the cartridge is directly involved in addition to the mechanism of the breech, and you give him a very complicated problem to solve, and it requires a considerable time to do it ; it is very difficult to specify the time.

719. In your opinion would it be fairer and better for the makers that the conditions should be accurately laid down, giving them, as you suggest, the barrel and ammunition, leaving them to their own invention for the rest, rather than giving them the whole arm to make ?—I have not the least doubt of it, and I should very strongly recommend that course to be taken, because there are very few inventors, indeed I know of none, who have all the means at their command for working out that problem.

720. The test you would employ would be a test solely as to the breech mechanism ?—Yes ; and I think that the Government, above all others, is the best prepared for working out the cartridge and the barrel.

721. Suppose, then, that the barrel and ammunition were given, how long do you think it would take to work out the breech mechanism ?—Do you mean simply a specimen of an arm, or a number ?

722. Say four of each of any system ?—Four months I think ought to be enough.

723. Would it require four months ?—I think so.

724. Have you formed any opinion as to which would be the best lubrication for bullets ?—I think pure beeswax will fulfil all the conditions ; that is, to meet all the exigencies of the service, in hot and cold climates, and all the varying circumstances which occur, especially in the British service.

725. Having regard to the shooting qualities alone, would you recommend pure beeswax ?—I think I should with expanding bullets.

726. How do you think the beeswax should be placed ; upon the bullet, in cannelures, or on the paper ?—In cannelures.

727. What is your objection to beeswax lubrication being placed upon the paper ?—Because it is introducing on the bullet an additional and different substance, and you subject yourself, if you use paper wrapped round a bullet in addition to a lubricant, to the variable thickness of that paper. I may say that it is impossible in practice, when ammunition is made by the million, always to have the paper exactly of the same thickness, and when you come to narrow the thing down with a view to obtaining such accurate results in shooting, the combination of the bullet and the barrel becomes so sensitive that even a variation of a little thickness in the paper will affect the result ; and it will do so even in the amount of wax there is on the projectile, for if there is a thousandth or two more wax on the bullet at one time than another it will affect the shooting.

728. Do you see any reason why the shooting from a breech-loader should be inferior to the shooting from a muzzle-loader ?—There is a reason in my mind, and it is this : the difficulty of inserting the bullet into the chamber, which is to be, under any circumstances, slightly larger than the bullet, so that the axis of the bullet is maintained perfectly concentric with the axis of the barrel, whereas when the bullet is put down from the muzzle it is a snug fit, and it is as nearly concentrically centred as it is possible to accomplish in practice. I think that is the chief reason why it is so difficult to obtain as good results in shooting from a breech-loader as from a muzzle-loader.

729. Might it not also be from the fouling in the muzzle-loader being always pushed down, whereas in a breech-loader it accumulates because there is nothing to remove it ?—Of course, in the case of the muzzle-loader, the loading does, to a material extent, carry down with the bullet the residuum of the previous discharge left in the barrel ; but where in a breech-loader you have a proper combination so as to avoid fouling the difference between the two is reduced to a mere nothing ; in other words, where the breech-loader does not foul there is no advantage in respect to loading from the muzzle, in which case the residuum in the barrel is carried down with the bullet.

730. I believe you have turned your attention a good deal to the locks of rifles ?—Yes.

731. Do you consider that the present rifle lock could be simplified ?—Not to be applied to the gun as it is now. I do not think it can be simplified.

732. But in a perfect gun do you consider that the

Mr. J. H. Burton.

7 Feb. 1868.

present service lock is a good lock for military purposes?—For guns of that class I do.

733. Do you mean of the Snider class?—I mean for guns requiring a lock to be attached to the side. There are guns which have what are called centre-action locks; they are let in through the centre up from the bottom, and others have a lock forming part of the breech action itself, as in my own; it performs all the functions of a lock; but I understand the question to refer to arms requiring a lock to be attached to the side.

734. Do you consider it an objection to an arm if it requires a lock to be fixed at the side, and therefore the complicated lock at present in use?—For a breech-loader carrying cartridges which have their own means of ignition for central fire, I can see no reason for retaining the old side lock, which was devised for a purpose very materially different from what is now required in central firing breech-loaders. I think the desired end can be accomplished in a more direct and more simple manner.

735. With regard to the stocks of rifles, do you see any objection to a divided stock. Can it be made as strong as a stock that runs right down the barrel?—I do not think it is quite so strong as when the stock is in one piece from end to end, and the gun is more pleasant to handle when the metal parts are all embraced in wood.

736. (*Captain Rawlins.*) From any trials that have been made do you think there are any disadvantages in compressed powder?—I have seen no disadvantages yet.

737. Do you know whether it is more liable to cause fouling?—My impression is that the success of my shooting with the ·500 bore rifle was owing to it. I believe I may justly say that my ·500 bore rifle, in which the compressed powder was first fired, was the first ·500 bore rifle with which satisfactory results have been obtained—that is, it did not foul; and I think it was to a very great extent due to the use of compressed powder. The pellet has an aperture extending up its axis nearly entirely through the cylinder of powder, and the flame from the cap passes up through this opening, and ignites the whole charge simultaneously, which is a very desirable object to attain. I think, therefore, that it has a decided advantage over a long column of uncompressed powder in a small-bore.

738. In noticing small-bores that have been foul, have you ever observed where the greater part of the fouling collects?—It is towards the muzzle.

739. Can you account for that in any way?—I do not think that I can satisfactorily account for it. I have never satisfied my own mind on the question; but it has occurred to me that it might be due in a great measure to a portion of the fore end of the column of powder being driven up with the bullet towards the muzzle, and as the bullet leaves the muzzle of the barrel the reaction of the re-entering air into the vacuum stops it there, and prevents its being carried out. I am inclined to think also that there is something in the thickness of the metal in small-bore barrels; they are generally thicker in proportion to the diameter of the bore than in larger bores, and there is less elasticity. I have found even in an Enfield rifle that if a band were screwed too tight fouling would be apt to occur under that band, and I attribute that to the barrel being constrained or held at that particular point, so as to destroy its liberty of expansion at that point.

740. (*Captain Mackinnon.*) You have stated that you liked beeswax to be applied to the bullet in cannelures?—Yes.

741. Do you mean in a bullet that is hollow, or in a solid bullet, would you have it still in cannelures?—Yes, the object of the cannelures is simply to retain the lubricant. I should add to that remark another, which is, that the advantage of cannelures is that they reduce the surface of the lead in contact with the walls of the barrel, and consequently reduce the friction.

742. (*Mr. Ross.*) Do you think it is possible that the fouling towards the muzzle may also be partly caused by insufficient lubrication, and that it becomes exhausted before the bullet has reached the muzzle of the rifle?—That would depend upon some other contingencies. In the case of a rifle in which there is a great amount of twist, there is naturally more friction than where there is less twist, and the possibility of the lubricant becoming removed or absorbed before it reaches the muzzle end of the barrel is increased by that means, that is, by the amount of friction caused by the twist.

743. Do you think that the inferiority in the shooting of the breech-loader, compared with the muzzle-loader, is in some respects due to a loss of power on the first explosion of the powder in expanding the cartridge case to fill the chamber?—I think it has something to do with it.

744. Do you know of any reason why the conditions as to bore, weight and description of bullet, and charge of powder, which are found to answer with the muzzle-loader, should not also hold good with the breech-loader?—You cannot ensure precisely the same conditions in a breech-loader which you can in a muzzle-loader. The difficulty that I referred to a short time back of centring the bullet in the chamber is a difficulty which must always exist in a breech-loader as compared with a muzzle-loader.

745. Do you think that the conditions which are found to answer best with a muzzle-loader might also be best with a breech-loader?—If all the conditions of the muzzle-loader could be applied with equal facility to the breech-loader, I should say that they ought to do as well in the breech-loader as in the muzzle-loader, but I cannot see that all the conditions can be maintained in the breech-loader.

746. I spoke merely as to the size of the bore, the weight and description of bullet, and the charge of powder, not of the chamber. I suppose the same objection would apply that you spoke of, with reference to the chamber, to all sizes of bores?—Yes, so far as the weight of the bullet and the charge of powder are concerned. I should say that irrespectively of the difficulty of centring the bullet in the case of the breech-loader, that equally good results should be obtained from the breech-loader as from the muzzle-loader.

747. The difficulties you have spoken of as to the paper round the bullet not having been experienced with the muzzle-loader, is there any reason why they should be more experienced in the case of the breech-loader?—I have never seen a small-bore rifle yet of materially less calibre than half an inch, even a muzzle-loader, that would go on for any great length of time without fouling.

748. At what distances have you tried the ·500 bore?—At 500 yards.

749. Not beyond that?—No.

750. Have you tried experiments with smaller bores than ·500?—Not myself.

751. (*Earl Spencer.*) Have you noticed the effect of frost on compressed powder?—I have not, but I do not see why it should have any effect.

752. The grains are, I believe, held together by pressure; nothing is used?—Nothing but pressure.

753. Do you think that the compressed powder would bear rough usage in a soldier's pouch?—Yes, much better than the other, and that is one of the advantages of the compressed pellet, the firmness it imparts to the whole cartridge, prevents its becoming deformed; you may throw it almost any distance, and you cannot hurt it because it is so firm.

754. It is protected, I suppose, to some extent by the metallic case?—It is protected of course from moisture, but the metallic case does not impart much strength to it. The principal element of rigidity in this cartridge is the powder pellet itself, and that is one of the advantages that this cartridge would possess over any cartridge for a small-bore with uncompressed powder, that is, its superior powers of endurance under rough usage, and its less liability to become

Mr. J. H. Burton.

7 Feb. 1868.

deformed and battered, or knocked out of shape by being carried in the soldier's pouch.

755. You spoke just now of the difficulty of boring small bores in steel barrels. Were the Whitworth barrels that were made at Enfield bored by machinery ?—I believe so. I do not know officially how they were done, for I never saw the machinery in operation, but I have had some experience myself in boring steel barrels. I have constructed machinery for that purpose, and I know practically the difficulties to be encountered in the process of boring; as the bore is reduced you increase those difficulties in a much greater ratio than the decrease of the diameter of the bore.

756. With improved machinery do you apprehend that there will eventually be any difficulty in doing it ?—I think it will always exist to some extent.

757. Do you consider that spiral springs are durable ?—I see no reason why they should not be, if they are made of proper material, and by the most approved mode of manufacture.

758. Do you think they could be procured of uniform quality ?—I do.

759. Have you had much experience in the use of spiral springs ?—My personal experience is limited to that which I have derived since I invented my system, No. 2, which is before the Committee ; but I have made diligent enquiry of persons who have used similar springs for other purposes, requiring an equal degree of durability in every respect, and I am informed that there is no difficulty whatever in making a spiral spring which will stand as satisfactorily as any other description of spring. We know that for the last 20 years the Prussian needle-gun has been in existence, and that spiral springs are employed in it for exploding the cartridges. I have never heard any objection urged against the durability of that description of spring as applied to that arm.

760. An objection to the present Government cartridge has been made, that a part of the case overlaps, and in consequence the cartridge is not concentric with the axis of the piece ; do you think there is anything in that ?—You speak of the overlap of the coil ?

761. Yes.—The same idea occurred to me, and in order to prove it, in one of my late experiments with the compressed powder cartridge, it occurred to me that there being a double thickness, around one-fourth of the circumference of the coil, it formed an irregularity that would affect the equal expansion of the bullet, and in order to satisfy myself on the point, I made a diagram inserting the cartridges as nearly as possible in that way (*describing*), so that the lap came always upwards, and I could not see that there was any superior result obtained.

762. (*Chairman.*) Do you know anything about riband springs ?—I have had no practical experience with them.

763. Are they not being used in the same way as spiral springs ?—Yes. I have heard of them being used for similar purposes, but I have never seen them applied to fire-arms.

764. Do you know of any objection to their being used ?—I do not know of any objection as to their durability; of course in a spring of that kind you cannot get the same amount of play, that is, the same amount of contraction and expansion that you can with an ordinary helical spring.

765. Do you see no advantage whatever in the riband spring ?—No.

766. Have you at present barrels made to fire the ½-inch and the ·451 cartridge made of compressed powder ?—Yes, several of ½ inch calibre, but none of ·451 calibre.

767. To which of your breech mechanisms are they fitted ?—No. 2 system. I have two barrels, one with a 36-inch pitch and another with a 42-inch pitch.

768. (*Captain Mackinnon.*) Do you think that a spiral spring is more likely to be affected by sea air ?—I do not see why it should be ; in fact I should scarcely suppose that it would be so much affected, as there is less surface to be acted upon by the salt air in the case of the helical spring.

769. (*Chairman.*) Could not the present side-lock be simplified by doing away with the sear spring ?—You might diminish the number of pieces by one, but there are many locks so made now. I think the side-lock in my No. 1 system has a main spring and sear spring formed of one piece.

770. Is not that cheaper ?—It is slightly cheaper.

771. Is it equally good ?—I think so.

772. You see no objection to it ?—No.

773. How much cheaper do you suppose it would be than an ordinary lock ?—I should say 3*d.* or 4*d.*

774. Will you be so good as to hand in the diagrams you have brought with you ?—Yes (*handing in the same*).

The witness withdrew.

Adjourned till Tuesday next at 11 o'clock.

War Office, Tuesday, 11th February 1868.

PRESENT :

LIEUT.-COLONEL FLETCHER IN THE CHAIR.

Captain RAWLINS.
Captain MACKINNON.
Earl SPENCER, K.G.
E. ROSS, Esq.
Captain HAIG, Secretary.

Colonel MANLEY DIXON, Superintendent of the Royal Small Arms Factories, examined.

Col. M. Dixon.

11 Feb. 1868.

775. (*Chairman.*) With regard to the weight of the rifle do you consider that a weight of 9 lbs. 8 ounces is as good as any for a service arm ?—I think it is too light.

776. At what weight would you prefer to fix it ?—The arm of the service has a very light barrel, and if you are to have small-bores you cannot get them to 9 lbs. 8 ozs. I consider that that is perfectly impossible; that is to say, you cannot reduce the thickness of the metal in proportion to the calibre.

777. What do you think the weight should be, rather more than 9 lbs. 8 ozs. ?—I should say 9 lbs. 8 ozs. without the bayonet.

778. Just so ?—I would say that it has always been my wish, and I proposed it years ago, to put at least 4 ounces more into the barrel of the existing Enfield.

779. Supposing that a smaller bore than the present service bore was adopted, do you think that 9 lbs. 8 ozs. would be too light ?—Do you contemplate reducing the length of the barrel ?

780. Without reducing the length of the barrel at present ?—In your advertisements you allow of 3 inches

Col. M. Dixon.
11 Feb. 1868.

being taken off, but now you recur to the present length. However, taking the present length of the Enfield rifle, I do not think you could get a serviceable arm for that weight with a small-bore.

781. Do you consider that the present length of the barrel is the best with regard to shooting qualities, or would an alteration in your opinion be desirable?—As far as the shooting qualities are concerned I think where the barrel is held correctly the length does not so much signify. I do not think it would detract from the arm shooting if the length were reduced 3 inches or 6 inches; but there is a reason which is rather against the reduction of the length for the soldier, which is, that the nearer you bring the sights together in the arm, the more your error multiplies in the error you make in the aiming from his shoulder, while the greater the distance is between the back sight and the front sight, the less the error multiplies and the less it is in aiming. It would not be shown from the mechanical rest, but from the shoulder you can easily understand that a man having the sights close together, say within two inches of each other, the error would be multiplied very fast by a very small shade of error at the beginning.

782. For pure shooting would a shorter barrel than the present 3 feet 3 inch barrel be equally good in your opinion?—I think so.

783. To attain flatness of trajectory and also accuracy at ranges beyond 500 yards and up to 1,000 yards, what bore do you consider would be the best?—I am at the present time making experiments with Colonel Boxer with the ½-inch bore. We were instructed about two years ago to take up the question of small-bores, but there has been such pressure put upon us that we have not been able until lately to take up that question. I furnished him with one Snider action fitted to four barrels of the same calibre, but with different descriptions of pitch of rifling.

784. Have you tried any of the ·451 bores?—I gave Colonel Boxer two years ago two barrels of ·450 and ·500. I have tried the ·450 and the ·451 as muzzle-loaders, the Westley Richards and the Whitworth arms, but there were difficulties in the way of the ammunition in coming to a very small bore for breech-loaders. At first the ammunition was very long, and there was great difficulty about it, but we finally considered, and I think it was also the idea entertained by the Ordnance Select Committee, for I have heard General Lefroy say so, that the ½-inch bore might be made a good gun, and so we thought we would make it the basis of our trials. Then Colonel Boxer reduced the length of the ammunition, by using compressed powder until he got the cartridge of the same length as the present service cartridge, holding the same quantity of powder and carrying a lighter bullet.

785. Supposing that the difficulty as to the cartridge was got over in regard to its length, which bore do you consider the best, the ·451 or the ·500, to produce lowness of trajectory and accuracy in shooting?—I have not yet had sufficient experience of these calibres to be able to answer that question.

786. But you have had experience I think with regard to the ½-inch bore?—Yes, and as far as that goes, of course by using a bullet of a certain weight, and with a certain weight of powder, the trajectory has been lowered.

787. In comparison with the ·577 bore?—Yes; and therefore it is natural to think that if you went down below that, for instance, to ·451, or to something like the Chassepôt bore, which carries a small bullet of 380 grains with a charge of 85 grains of powder, you would be able to get a very considerable flatness of trajectory. The angle of the ·500 bore is small at 500 yards and the shooting is good, but I cannot say that of the Chassepôt, it is not good. My experiments have shown that there is a limit to the velocity of rotation imparting steadiness to the bullet; the two do not necessarily go together, and it requires a very nice balancing of all these points to get steadiness of shooting and flatness of trajectory.

788. In your own experiments have you principally tried the ·500 bore?—That is what we have made most diagrams with, at the same time we have not gone very far into that question. Colonel Boxer will show the Committee some diagrams which have been made, and they will see how far those indications point to what it may be possible to attain to.

789. Speaking now with regard to the ½-inch bore, what description of rifling do you consider the best?—That is entirely a matter of experiment; it can only be worked out by careful experiment.

790. Have you worked out any of these experiments?—No, I have merely adopted, for the sake of trying what cartridges we could get, and also to get rid of fouling, different pitches of rifling, but adopting the same form of rifling for the four barrels that we use; that is to say, the 5-groove rifling with different pitches, from a 20-inch pitch to a 42-inch pitch.

791. Do you know the Metford rifle?—Yes, from description, but I have not had his gun in my hands.

792. Do you know the Whitworth rifle?—Yes, we have made a large number of them.

793. Do you consider that that system of rifling is applicable to a military arm with the ½-inch bore?—I am afraid not for breech-loaders, and for the cartridge; there would be a difficulty I am afraid. I think that there would be a difficulty in this way, that the angles of that rifling would be a difficult point.

794. Reports have been received, and published, from different regiments as to the performances of the Whitworth rifle as a muzzle-loading arm?—Yes, some of them were sent to India, and others to the Rifle Brigade, three battalions were armed with the Whitworth rifle.

795. Were not the reports very contradictory as to the performances of the Whitworth rifle?—Yes; they were favourable in some places, where perhaps the climate and other circumstances favoured the ammunition, the arm performed better, while in other places it was the reverse. There was one rifle regiment reported that within the last 12 years it had had the misfortune to have six different descriptions of arms, all different from the present rifle, the worst being the Whitworth. The Whitworth caused very great difficulty when it fouled. I think that was found at the Curragh.

796. The principal objection, I believe, was that the fouling caused a difficulty in loading?—Yes.

797. But that difficulty would not occur with a breech-loading arm?—It is impossible to say. To close the angles with a bullet, you must have a great deal of upsetting power in the bullet. The hexagonally formed bullet would make a great difficulty in the ammunition. If it was mechanically fitting you would have to put each cartridge into the chamber so that the angle of the bullet should lie in the angle of the rifling. If you do not do that, but use a cylindrical bullet, the angles are considerable, and rather deep in that rifling, and I think that that would occasion fouling.

798. The objection to the Whitworth rifle was that the fouling was so great as to make the loading difficult, not that it affected the shooting?—It did affect the shooting certainly. The great thing in a military arm is that you shall be able to load and fire as often as possible, with no difficulty. The next element is with as much accuracy as possible.

799. In the reports made upon the Whitworth rifle was not the difficulty in loading the principal objection?—Yes, because that shut up the arm altogether. I consider that that was condemnatory of the arm.

800. On the other hand, some of the reports received were very favourable to that rifle, particularly those from India?—Yes. I have no doubt that they would be favourable from India to the arm on account of the climate. Where the arm suffered most was in extremes of temperature, where there was a great dryness in the atmosphere. I believe that in the Mediterranean it was found to perform tolerably well; at Gibraltar, and also in India, I believe it did very well. But still with regard to reports received from regiments, you must take them just for what they are worth. A soldier goes out and fires perhaps

half-a-dozen rounds, or at all events very few rounds, as compared with the very trying examination and test which an arm gets at our hands.

801. Personally, as I understand, you have not tried the Whitworth system of rifling as a breech-loader?—No.

802. Nor the Metford?—No.

803. Have you ever tried the Lancaster rifle?—Yes, that was tried at first, and the rifling was also tried at my suggestion before we made barrels to give out to the armourer serjeants for repairs. I said there was now a good opportunity to ascertain whether there was any real advantage in the Lancaster rifling, and I suggested that a certain number should be sent to the Ordnance Select Committee. I think there were nine of each of the Lancaster and the 5-groove Enfield rifle. The nine were rifled, having part iron and part steel barrels, by Lancaster, and the results were not satisfactory. To what that was attributable I do not know, but Mr. Lancaster is now in communication with me; we are, in fact, working together. I am making some barrels for him, and he is altering the form of his rifling, and also altering the dimensions of his barrel a little, just to see whether he can find out the form best adapted for the present ammunition of the service.

804. Was the Lancaster arm tried with the present bore of ·577?—Yes.

805. Have you ever tried the Lancaster ½-inch bore rifle?—I have seen his small-bores; that is to say, he has frequently asked me whether I would lend him my range at Enfield, so that he might come there to try them. I have sometimes seen the results, and it appeared to me that it was quite a chance thing when his rifles succeeded.

806. In what respects did they fail?—The failure was simply this, that some of the guns would not shoot at all.

807. Was there a great disparity in the shooting of different guns?—Yes; there were never two the same.

808. Could you at all account for that disparity?—No, I could not. I should say that there must have been some irregularity in the manufacture, or that the system of manufacture was wrong.

809. In your opinion, are the Lancaster rifles difficult to make?—I think the principle is unmechanical. He describes his bore as a cone from the breech to the muzzle, and not a cylinder, and he has two progressions inside. He has a progression in the depth of his rifling from the breech to the muzzle, that is to say, it is deeper at the breech than it is at the muzzle. He has also a progression in the spiral, an increasing spiral towards the muzzle. I think he has had too much work thrown upon his bullet. The bullet has to alter its form the whole way up the barrel in the angles of the rifling, and also in the depth of the grooving.

810. From the observations you have made, suppose you were called upon to make rifles with the ½-inch bore, what system of rifling should you adopt?—I have as yet not had sufficient experience to enable me to say. I am of opinion that the first step which I should expect to be taken would be some determination on the part of some competent authority as to the calibre and total weight of the gun, the length of the gun, and possibly the number of rounds which the soldier should carry. Take those four points. Then I think the next thing should be to place in the hands of myself, as representing the Enfield factory, authority to set to work with the arm, and Colonel Boxer to work on the ammunition, that we could do as we did with the Snider. We could work out the rifling if we were limited to the above points. Something must be fixed; the form of the ammunition and the description of it must be fixed. The service ammunition at the present time, I believe, is generally admitted by all competent men to be about the best in Europe. The principle of that cartridge would be taken, because, if you did not limit it some one might say, "Why not have a cartridge which totally consumes," and another might say, "Have a rim-fire cartridge," so that we should be entirely at sea as we were when we first began.

811. The Committee has fully considered all those points.—No doubt, but these indications must be laid down before we could be called upon to give a fair answer to the question. We could then work within those limits and place the results of our labours in the hands of the Committee, and it would be for them to conduct their own experiments, and to agree or disagree with what we had done. There is no evidence in the country on the military points concerned in the selection of such an arm which I think will be of much value to you as far as the civilian gunmakers are concerned.

812. I believe you have tried experiments up to a certain point with the ½-inch bore?—Yes.

813. From the knowledge you have obtained are you able to state to the Committee what system of rifling you prefer in order to obtain a low trajectory and great accuracy?—Certainly not; but at the same time I am able to say this, that I believe the results, so far as they have been attained with the ·500 bore, are satisfactory, both as to accuracy and lowness of trajectory.

814. Using what system of rifling?—With regard to the system of rifling, as I said before, there are four barrels, with different pitches of rifling, and of course those are intended to represent or to meet the experiments made with different lengths of bullet. The longer bullet takes a quicker pitch in the rifling in the same calibre. Then we wanted to try whether we could do with a shorter bullet, and that requires a less quick pitch with the same calibre. Therefore, although it is the same system as the five-grooves with a certain progression in depth from muzzle to breech, yet you must vary the pitch, or the quickness of the turn as you vary the bullets in length, and consequently in width.

815. Can you tell the Committee with what length of bullet and what description of rifling you obtained the best results with the ½-inch bore?—I can hardly tell you that sufficiently, because with one bullet and with one pitch of rifling you may get better results at one range than at another, and for long ranges a heavier bullet has rather an advantage over a lighter one, and it seems difficult to combine the two, that is to say, to have a light ammunition suitable to give you sufficiently good results at short ranges, and at the same time to shoot well at long ranges. I think that experience points to this, if the Commander-in-Chief or the War Office want to get the best gun for lowness of trajectory, and also lay down that you must shoot at long ranges, and make only a certain mean deviation, there must be two patterns of arms in the service.

816. Do you not think it might point to the necessity of two ammunitions for the same gun?—That is another form of putting it, but I think that that is an inferior mode of solving the problem. I think that generally speaking where you try to make one thing perform two duties, and two duties which are not comparable, you do not get either fulfilled well. I think that two guns in the service would produce the result in the best form, but of course there might be other reasons against it. It might be said, "We must "sink the very best form in order to prevent the con- "fusion which will possibly arise from having two "guns in the service, and two ammunitions."

817. Do you not think it is possible to have two sorts of ammunition to do their work well out of the same gun, one for shorter ranges and the other for longer ranges?—The difficulty, in my opinion, is to control the use of that ammunition.

818. But as a fact could it not be done?—As a fact I think you might do it; for instance, you might take the short Enfield Snider, and there is no mistake now that there is one ammunition, the heavy one, which shoots almost to perfection out of that gun, and that is No. 2 cartridge.

819. At what range?—It shoots well up to 1,000 yards; that is, for a military gun. I do not say that

Col. M. Dixon.
11 Feb. 1868.

it is a match rifle. I believe that the gun would make an average of about 3 feet 6 to 4 feet mean deviation at 1,000 yards, as a rule, and I think it would make at 500 yards, with a heavy bullet, a mean deviation of about 12 inches. I think if you were to use another ammunition, a lighter one, you would not get such good results, but they might be sufficient for ordinary ranges, and for long ranges you might use the other.

820. With lighter ammunition used up to 400 yards you would get a flatter trajectory than with heavier ammunition?—Yes, with the present calibre of the service. If you kept to the same weight of powder and only reduced the bullet.

821. Would you do so with the same bore?—Yes.

822. Is there any military objection to a small-bore because of the size of the bullet?—If you go beyond a certain point, I think there is.

823. Say ·451?—·451 would do its work, if it hit a man in a vital part, as well as a large bullet. Of course there is a greater chance of a small bullet missing a vital part, and I believe, as I have been told by a man who has shot in the Western prairies, that he never uses a small bore for large game, because if you do not hit the game in a vital part it is of no use. They say that the shock is tantamount to something, but a small bullet has been found to fail in this respect.

824. In ordering barrels to be made, the first step I suppose would be to determine the length of the cartridge?—Yes, if you could do it. The length would depend upon the quantity of powder used and the weight of the bullet; you might like a bullet instead of being 380 grains to be 440 grains. The question I think involves an immense amount of alterations, and different points to be investigated; there are the barrels, chambers of different lengths, cartridges of different lengths and of different sizes, all these matters can be best worked out by the means and appliances which I possess on the one hand and Colonel Boxer on the other; and if the question of the $\frac{1}{2}$-inch calibre was settled, and that was taken as the calibre, and we wanted to get thoroughly to the bottom of it, to see whether you could trust to it, and to the ammunition made for it, that it should not foul, and you wanted the best form of rifling for the barrel, and you say, we will start with the principle of the present cartridge made of compressed powder, and you put that into the hands of myself and Colonel Boxer, of course you will get to the bottom of the value of the $\frac{1}{2}$-inch as a military gun and the cartridge too, leaving the other questions as to the best form of breech mechanism for other experiments to determine.

825. How long would it take you at Enfield to make barrels, if the calibre, the size of the chamber, and the description of rifling were given you?—In 14 days any number of barrels for experimental purposes could be made.

826. Have you formed any opinion as to cartridges and the weight of the bullet?—I think Colonel Boxer will be better able to show the Committee what he has been doing; he will show you the minimum weight that he has tried.

827. Do you think it would be possible to obtain a more simple and equally efficient form of lock than the ordinary side lock which is now used?—There is nothing complicated in that lock; it is very simple to make, and the action of it is pleasant to the hand. All the parts have been made with successive improvements for many years past.

828. Do you not think that by adopting a perfectly different principle, a more simple and cheaper lock might be made something similar to the lock of the Chassepôt or the Burton No. 2 system, or that of Carter and Edwards?—It is not a lock, it is merely a spring and a catch as with bolt guns. The present lock gives you at once an indication by the position of the hammer whether you are at half cock or full cock, but with bolt guns you do not get that indication, or not so well. As far as it goes, I think it is an advantage. I am not prepared to say that you may not do something to simplify the lock. There is the Martini gun, and that looks to me as simple as anything you can possibly have. I have only casually looked at that gun, in examining it for the cost of manufacture. I stripped every one of the nine guns and examined every single part with reference to the cost of manufacture, and one could not help being struck by the great differences there were between the complexity of some and the comparative simplicity of others. Some which had no lock of the present form were nevertheless more expensive in their construction.

829. Do you know of any objection to the bolt system when applied to breech mechanism, as compared with the block system?—I think the block system is the safest.

830. In what particulars is it the safest?—The block system requires that in loading you should put the cartridge home with your thumb before you can close the block, and therefore you never run the chance of the block striking the cartridge if you happen to have a defective one, which you might have, and a blow at its base might fire the cap. With the bolt system I think you are never free from that danger. There is the Cowper gun, a bolt gun. I shot with it in Birmingham, when it was first brought out, and I rather liked it. I showed it to a Turkish colonel who was with me, and I said that it appeared to me to be a good gun, but with this arm there was an unfortunate accident from the cartridge exploding on loading, and the inventor has changed his system since. I know most of the gunmakers in Birmingham, and I believe that one and all of them have objections to the bolt system for the reason I have given. The block system is the one which is preferred.

831. Would that include the one made on the Peabody and Martini principle?—Yes.

832. Have you made any experiments in shooting with self-consuming cartridges?—To a limited extent with the Chassepôt and considerably with the Westley Richards. We had to make a large number of that pattern arm at Enfield, but the cartridge failed in cold weather.

833. Why was the Westley Richards cartridge a failure in cold weather?—The paper and the composition which he puts round his cartridge is the difficulty; until the barrel warms up it sticks to the sides of the barrel and prevents the cartridge from going in. His ammunition is made with very great care, that is to say, it requires a very nice fit with his chamber. We had more difficulty in settling the dimensions of the chamber of the Westley Richards carbine, and it was a more troublesome gun to make than any gun we ever made, and then the ammunition gave us the finishing touch to the whole thing. We never could fire with it in cold weather until the barrel got warm.

834. Is it your opinion that guns in which self-consuming cartridges are to be used are not so applicable for military purposes as guns made for the metal base cartridge?—I do not think that any one of them of present patterns represents what we should call a serviceable cartridge. I have a Chassepôt which was lent to me by one of the manufacturers with some of the cartridges, and I went through a series of experiments with the gun, but the cartridges failed, there were continual miss-fires, a difficulty in loading, and bad shooting.

835. (*Earl Spencer.*) What do you consider is the principal cause of fouling in a rifle?—I think that one cause is perhaps inequality in the composition of the gunpowder. At times we find some gunpowder foul more than other kinds, and in trying that question, we found that it depended a good deal upon the specific gravity of the powder. Another cause of fouling, I think, is the particular construction of the gun, allowing of the escape of gas before the bullet upsets into the grooving, and of course there is another reason, which will very largely enter into the question; that is, the dryness of the atmosphere. In registering the hygrometrical condition of the atmosphere by the wet and dry bulb thermometer, we find that when there is a considerable difference, say up to 6°, and particularly in the

case of the Whitworth, it is of no use going on shooting. You require to have a certain amount of humidity in the atmosphere to moisten the results of the combustion of the gunpowder. You must keep it in a somewhat deliquescent state to enable you to go on, but in a very dry condition of the atmosphere, and when a north-easterly wind is blowing, all the small-bores, muzzle-loaders, fail in their shooting from fouling.

836. How do you account for it, that in India, where the climate is very dry, they succeed?—I do not know whether the dryness of the climate in India is combined with the peculiar effect that is produced by a north-easterly wind drying up everything in the way we have it in England. I suppose the climate of India is naturally at all times, or at all events in the summer time, tolerably dry, but when I say dry there, I do not know what amount of humidity there is in the atmosphere, or whether they have in India that dryness that we have with north-easterly winds.

837. The fouling increases I think in proportion as you lessen the bore with a muzzle-loader?—Always, as a rule.

838. Do you think that the rifling has much to do with the fouling?—I think that one system of rifling, for instance the deep angles of the Whitworth, rather tended to produce more fouling than the Enfield system or than the Lancaster system. I think, with a small-bore, that the Lancaster system showed less fouling once when it was tried before the Committee in 1863 than any gun that was tried with a small-bore.

839. Do you think the length of cartridge in a small-bore which is necessary for the powder has anything to do with it?—I think so. I think it influences the fouling of the powder and it prevents complete combustion. Then there is also the larger cooling surface of the barrel which is presented. I think that the quicker the powder is burned the less fouling there will be. I believe that Colonel Boxer will tell the Committee that with compressed powder, where you get it completely burned, there is a total absence of fouling.

840. If the compressed powder system answers, that will be something in favour of the small-bore?—Certainly; that has got over a great difficulty, which was the length of the cartridge for a small-bore. Up to this time there has been a total absence of fouling in the small-bore breech-loader under trial.

841. Is the rifling in the Westley Richards and in the Whitworth very nearly the same?—Yes, only one has eight grooves and the other six.

842. There has been no very serious drawback in the Westley Richards on account of fouling?—No; not with the breech-loader. The principal difficulty in that arm is found is cold weather, or in very dry weather, and that is in loading for the first eight or nine rounds, but when the barrel gets warm then you can load. But in the case of a soldier, who would fire perhaps a few rounds and then stop, there would be considerable difficulty.

843. How do you account for the difference, the one fouling as you say very badly in some cases and the other not?—One is a breech-loader and the other a muzzle-loader. Mr. Westley Richards got over the difficulty by driving his bullet through the barrel and getting it to the bottom of the grooves each time.

844. Do you think the same difficulty would apply to the Whitworth breech-loader as to the muzzle-loader?—Perhaps not. The principal difficulty that I should anticipate would be from the cartridge; if you had a cylindrical bullet you would have a chance of not upsetting into those deep angles and so cleaning them out, whereas if you had a hexagonal bullet you would have a difficulty in getting into the chamber each time so as to enter the angles of the grooves; I daresay that the breech-loading would help you considerably over the difficulty of fouling which you meet with in small-bores in muzzle-loaders. I have always agreed with Mr. Westley Richards on that point.

845. Do you prefer forcing the bullet into the barrel or expanding it into the grooves?—The less work a bullet has to do the better, and the more simple the arrangement for getting a certain initial velocity, which means a low trajectory. If you force the bullet through the barrel that means a high charge of powder relatively to the bullet, so as to keep up the velocity to a certain point.

846. Does the expansion of the bullet take place in the chamber before it enters the barrel in all cases?—The upsetting of the bullet takes place, I think, almost instantaneously after the first blow.

847. If you use a bullet that will go down the barrel, is it not in a sense forced through by being upset in the chamber beforehand?—Yes, it is a little larger. It gets to the bottom of the grooving by forcing through.

848. So that the bullet when it enters is still smaller?—It to a certain extent, as it is termed, slugs through It upsets in the chamber, and is afterwards forced slightly through the grooves. You have the whole of the inertia of the bullet to resist, but when it is once moved, and it leaves a space behind, of course then you cannot expect that it will be doing more work laterally.

849. It has been stated by a previous witness that the greatest expansion takes place about six inches from the chamber. Do you think that possible?—I do not know how it could be proved. I believe the expansion takes place with the first blow.

850. Could it not be ascertained by cutting the barrel into different lengths, and by seeing whether the bullet was marked with the grooving?—That might be tried. Mr. Metford, I believe, holds that the expansion is gradual. He thinks that all the expansion does not take place on the instant. My argument is this, that the bullet has the whole of its weight or the *vis inertia* to meet the first blow, and therefore it is in a better position then to expand than it is directly after it is moved. When it is once moved I think you can hardly depend upon much expansion.

851. What has been your experience with regard to an increasing or uniform twist in rifles?—I have not had much experience except so far as the Lancaster rifle is concerned. The increasing pitch, I think, first of all was adopted in France—the increasing spiral—but the French gave it up. It was then taken up in America, but there it was given up. Then Mr. Lancaster took to it, for this reason, and I believe the only one was that there is less recoil with it. As a matter of theory, to suppose that a bullet should take up its angle of rifling gradually, and not at first. I have no doubt that the original idea was that the first jump of the bullet would drive it straight out, and that it would not take the grooves. I have no doubt in my own mind—and I believe that that first caused the principle to be tried—the idea that the bullet would strip, and not at first enter a quick pitch, and in order to prevent stripping, and to ensure the bullet taking the grooving, it was arranged so that it should be presented very gradually to the bullet. But the objection to that system, I think, is the constant alteration of the form of the bullet all the way up, and thereby throwing so much work upon the bullet to do. I do not see any advantage in it. All our guns with the Enfield rifling have always held their own with the Lancaster rifling at a certain distance. It is a singular fact that up to about 500 yards the Enfield is always at the least equal, I may say, to the best of the Lancaster shooting of that calibre, and more regular; but beyond that, the Lancaster has a considerable pull over the Enfield rifle, because it has a quicker pitch at the muzzle, and therefore the bullet has greater steadiness imparted to it, and it is enabled to reach a greater distance more accurately than from the Enfield rifle.

852. Is there not more work thrown on the bullet upon the Lancaster system than upon the Metford system?—I think there is. The Metford system is a complicated one. It is a very high-gauged bullet. It fits very closely, and it is only, I think, adapted for match purposes. It requires careful loading and careful lubrication, and it takes comparatively speaking a heavy charge, compared with what we use. I am

Col. M. Dixon.

11 Feb. 1868.

speaking of a muzzle-loader, and with that gun he has done great things.

853. Do you see any reason why you should not get as good shooting out of a breech-loader as out of a muzzle-loader?—I used to think it would be a very difficult thing to do, but that was from the fear one had of the impossibility of ensuring constant results from the ammunition. I used to be afraid that one could not always depend upon the action of the ammunition in a breech-loader. But I do not see now, with the experience that we have had, and the way in which the ammunition is made, and the results of the last two years—certainly the results of the last year in the hands of the soldier—and considering the excellent reports which have been sent out of the shooting made, which is from 25 to 50 per cent. better than they made before, I do not see any reason why one should now adhere to that opinion, or that there should be any greater difficulty in getting uniform results.

854. Especially with the metallic cartridge?—Yes, the only one that I know is the metallic cartridge. I think that that really must be the ammunition. I do not know of any cartridge that has at all approached that.

855. I suppose the first objection was to the escape of gas, which is probably now got over?—Yes.

856. Do you think there is any objection to the loss of power in the expansion of the cartridge case, which does not apply in the case of the muzzle-loader?—Whatever results there are are constant and uniform. Supposing you had a result of a certain loss, it would be a definite one and a constant one, and therefore you would have uniformity in your results.

857. Just so; but that would be in favour of the muzzle-loader, would it not?—Yes; it is a fine point that, but it might be in favour of the muzzle-loader.

858. You have stated that there was a difficulty in making a Lancaster rifle with uniform shooting qualities?—We never made them ourselves; they have always been made by the trade. They are a patent invention, and only one corps has been armed with them.

859. Are the barrels made by machinery?—Yes, in the ordinary way in which all barrels are made; they are rolled and bored by regular boring-bits, and then two grooves are cut in them—for it has two grooves—the guide-bar is made to represent the particular pitch, and the increase of that pitch from the breech to the muzzle, and the depth of it, is given by the particular shape of the cutter and screw, and that is done in the rifling machine. But when the two grooves are cut, what I call the unmechanical part of his arrangement is this, he has first a cylinder—a ·577 cylinder—all the way down, and then he cuts his two grooves. Then he puts in a leading tool, which is a piece of copper, with emery and lead, the emery being over the lead, and then he travels it for a quarter of an hour or half an hour up and down the bore, in order to bring the edges of the cut left by the grooves into correspondence with the lands, so as to lose the effect of the grooves, and run the angles of them into the lands. Now, we never allow a barrel, after it has once been made, to be touched in that way, because we should lose all truth in the cylinder, and, in fact, there would not be an inch of truth in the barrel.

860. Could not that operation be performed by machinery?—I am afraid not. The scrubbing would be more or less according to the quantity of emery on the lead, and the size of the lead, and it is very difficult to control that. Then there is another point. He opens out the rear of his barrel in order to make it a cone, so that he takes out all the cylinder there, and it becomes for about 10 inches considerably larger than further up the barrel. He has I do not know how many dimensions; ·580 runs up for some 10 inches, and then it fines down to the muzzle, and you only get ·577, so that in point of fact you have no truth whatever. I therefore consider it unmechanical. When we had a contract for about 5,000 of his arms in Birmingham, I was obliged to shoot every one of them as part of the view. You could not tell what the result was except by shooting them. It is very troublesome and an unfortunate thing where a system is presented which throws you into such difficulties and uncertainty in the manufacture.

861. Would the same objection hold if you had the necessary machinery and you made them under your own superintendence?—I think you never could overcome the difficulty if this system of freeing and coning is to be pursued; there is no way of viewing the barrel after it has left the machine.

862. Are the arms which are issued by the Royal Engineers all selected arms, and viewed in that way?—They are viewed like all other arms, but then we have to shoot every one of Lancaster's.

863. Are there more of them rejected than of other arms which are commonly ordered?—Whenever we met with one that would not shoot I returned it to Mr. Lancaster, or to the manufacturer who made it. He altered it or fitted a new barrel in, and then we had to fire it over again. There are two systems of rifling in use in the service, one for the Engineers and one for other troops. There are positively, in my opinion, very great disadvantages in the system, even supposing the two guns to be equal, where there is a disadvantage in the point of manufacture. On the one hand, I can depend upon the rifling in my rifling machines, and upon my boring. I can also depend upon what I call the viewing of the barrel, in order to determine straightness and accuracy, and without being obliged to shoot every barrel. If we were making, for example, 2,000 a week, it would be quite impossible to do it.

864. Have you made any of the Westley Richards' carbines?—Yes, we have made 20,000 of them.

865. Have you not found the same objections to them in the manufacture?—No. There is a cylinder and there is no freeing; it is merely cutting the grooves in a true cylinder, and so with the Whitworth.

866. Do you think that spiral springs will stand wear and tear in military service?—I was afraid, when we had them out first in Canada, that we might find them go frequently; in cold climates the springs sometimes go, but that has not been the case. When we sent out the first batch of arms in 1866 to Canada, and the first 10,000 that were made were sent there, I proposed that one of my head viewers should go out with them in order to superintend the distribution of the arms in Canada, and that he should remain at the disposal of the general commanding to instruct the different regimental instructors, and be on the spot to remedy any little defects that might be discovered, because everything was new. This man was kept there for 14 months, and he was there during a winter, and on his return his report to me was that everything had proved most satisfactory, and upon the point referred to, namely, the action of the springs, I questioned him most particularly, and he stated that there had been no difficulty whatever. I was, of course, very much gratified to find that the whole thing had worked so well as it had done, because that arm had been hastily got up, and I expected many difficulties to occur.

867. Probably the same observation would apply to the larger spiral springs which are used in the bolt system?—I think they could be made to stand with good metal that had been tempered properly, but the government gun springs are such trifles they can be easily replaced. They do not cost above a halfpenny a piece. A soldier has the means of taking out the piston, putting a spring on and putting it back again. It is an operation that does not take half a minute to perform; therefore, supposing these springs had been found to go, there was a ready means of replacing them.

868. You spoke just now of the Cowper rifle. Did you notice the lock of that rifle well?—It is a bolt gun. I did not take it to pieces, but I had it once to fire, and I thought it worked pleasantly, firing out of it the Boxer cartridge, that I was rather taken with the gun. I was sorry to hear of the accident which occurred afterwards with it at Wimbledon. I have been particularly asked to look at some bolt guns

by Mr. Macdougal, for public purposes in Canada. They are looking for a new gun now with which to arm their militia, and funds are being set aside to purchase arms. He asked me my opinion, seeing that the government were ready to purchase them, and he appeared to be in favour of some form of bolt gun.

869. Have they not adopted in Canada some of the American arms?—They have bought some of Peabody's guns, but only a small number. I think they wanted to adopt one of Carter and Edwards's if it was likely to work.

870. Do you know whether they were satisfied with Peabody's rifle?—I do not think they are satisfied with it; the American government was not satisfied with it.

871. Have there been any official reports made on those arms?—Most of the American arms presented to our government for trial have been reported upon by committees of American officers.

872. (*Mr. Ross.*) Do you know of any difficulty in manufacturing small-bore barrels in boring them?—No; we have manufactured the smallest bore known in the English service. We have made 9,000 Whitworths and 20,000 of Westley Richards of ·451 and ·450 bore.

873. Did you find no difficulty in the boring?—Not the slightest.

874. Have you seen the Whitworth rifle fired with hexagonal and cylindrical bullets?—Yes, frequently.

875. Did you have the best results from the hexagonal bullets?—Yes, at long ranges, with 85 grains of powder.

876. Can you state approximately what the expense of altering the machinery at Enfield for the manufacture of a new arm would be, taking, for instance, one of those arms that you saw the other day?—For all the parts—it will depend of course upon the arm—but for any service arm that you might propose I do not think that it would cost at the outside more than 6,000*l.* to alter the machines, which means of course to make new tools and fixtures; there would be no trouble whatever in that, and any arm that might be chosen could be made. It would be merely a question at first starting of greater or less alterations to the existing fixtures and tools. One arm would probably be more costly than others; but with the means which the government possesses at Enfield anything could done as to manufacture. I think the Westley Richards was the most difficult gun to make, because there was not a single screw or spring or part of the gun that was similar to anything that we had ever made before.

877. (*Chairman.*) Was it more difficult to make than the Lancaster rifle?—The only difficulty with the Lancaster is the inside of the gun, but in the Westley Richards the stock, the lock, and every part of it was different; still it was only the first difficulty of making new fixtures and altering the tools, gauges, &c.

878. (*Mr. Ross.*) Do you know of any reason why the conditions as to the bore, the weight of bullet, and the charge of powder, which are found to answer best with the muzzle-loader, should not also hold good with the breech-loader?—It is a matter of experiment all that, because the whole of the conditions are so altered you have hardly anything to guide you. As a general rule and within certain limits I do not see why you should not get much about the same results. The way in which the powder is inflamed is different; you get the whole effect of the powder because the bullet fits the barrel better; you have nothing between the barrel and it, no paper, and with a proper lubricant the results ought to be at least as good.

879. (*Captain Mackinnon.*) You have stated that when the matter was confided to you and to Colonel Boxer about trying experiments with the small-bore, you decided upon commencing with the ½-inch in preference to a smaller one. Was your reason for doing so the length of the cartridge only?—I think it was rather more than that—it was more an arbitrary reason—it was more I think because we had heard the Committee express rather an approval of the ½-inch bore.

880. In a manufacturing point of view, is polygonal rifling easier to make with reference to the curve of the grooving than the Enfield system?—In polygonal rifling, as far as a single cut is concerned, there is not much difference, but of course when you get to a Whitworth with six cuts instead of three, and you have to go over each cut 12 or 14 times, the time and cost become greater.

881. Also in viewing I suppose?—No; there is no difficulty in that.

882. If divided stocks as in the American guns could be made sufficiently strong for military purposes, would not they be advantageous on account of price?—Very little I think.

883. Would you not require a larger piece of wood to make a long stock, whereas a divided stock might be made of two smaller pieces?—I do not think there would be any economy in making stocks of two pieces. If we were to ask for two pieces they would cut them out of the best parts, and you would have to get the stock equally solid to the stock now in use, and finish it up. I see no economy in it. It would probably be necessary to divide the stock into two parts after it had been machined and operated upon as a single piece.

884. Would you prefer steel barrels to wrought-iron barrels for a military weapon?—What is called steel now is the metal that was first used by Mr. Whitworth, and was made by Messrs. Firth of Sheffield. It is a peculiar metal, with more of the characteristics of iron in it, like homogeneous metal, than of steel. I think that at the present time that it is so available, and I think preferable, because you have a stronger and harder material, and the barrel can be made by drilling out of the solid without employing heat for rolling and welding. In making an iron barrel there is a lump which is welded on, and we cannot weld with that steel.

885. I did not refer in my question so much to manufacturing advantages as to the rough usage it might receive?—I hope it will prove a very superior metal for that purpose.

886. If hardened bullets were used, do you believe that they would wear away the grooving very much more than leaden bullets?—How would you get the expansion?

887. They would be upset.—I think you would not get them to upset sufficiently; not hardened bullets.

888. (*Capt. Rawlins.*) Metford uses bullets which are slightly hardened?—You might have a very little tin or zinc sufficient to make a bullet a little harder, but if you had more than that you would have great difficulty in getting expansion from hard bullets.

889. In a small-bore is a cavity at the base of the bullet necessary in order to ensure expansion?—Unquestionably we could never get good shooting with solid bullets, not in our experiments with the Snider, but in a muzzle-loader the length of the bullet suffices to ensure its upsetting sufficiently without a cavity at the base.

890. Would a steel barrel be stronger than the present service barrel?—From its greater hardness I think it will resist rough usage and wear and tear better.

891. Could a barrel be made for a small-bore of the same weight as the present service arm?—I think there are other circumstances to be taken into account. You might make a barrel for certain purposes of a strength to resist the impact of percussive effect of a charge of gunpowder, but you must reduce the metal very considerably, and what do you come to then? to a small barrel, with such a section that you might possibly be able with an external blow to bend it very easily. Then again you would find it difficult to fit a bayonet on it; if you reduce the thickness of the metal on a small-bore round the bore in comparison with the thickness of the metal in the Enfield rifle, you can easily imagine that the barrel would be too small externally for service purposes.

892. Would it be necessary to do that in order to bring it to the same weight as the present service

Col. M. Dixon. 11 Feb. 1868.

arm ?—Not quite so, but it would be very much the same thing. All small-bores of the service are heavier because you cannot reduce the thickness of the metal in proportion to the bore. Whitworth made his rifle a pound heavier in the barrel.

893. In a military point of view, do you think the present length of the barrel might be altered with advantage ?—There are various views entertained upon that point; it depends entirely upon the view one might take, and each individual who considered the matter might take a different view as to the necessity of using arms so long.

894. Have you seen much of magazine arms ?—I have seen the Spencer repeating rifle, and the Henry with the cartridges lying up and down the stock. I have had some experience of the Spencer.

895. Do you think it would be very difficult to manufacture such arms ? — All magazine arms of course have more mechanical contrivances about them, and of course they would be more difficult. They would involve a large number of parts to be made and larger plant of machinery to be used in making them, and generally speaking those parts require to be made very exact in order to work well. I think that they would be much more difficult to make.

896. When speaking of the Whitworth rifle, do you think that the fouling which takes place is due to the arm or to the ammunition principally ?—In answering that question I might say this, that the arm did foul with the ammunition used; but by the adoption, first of the loading rod, the mechanical one, and so clearing the gun out each time, he got rid of the fouling, and afterwards by improving the ammunition and putting a little metal disc at the end of the base of the bullet, he obtained the same result by what you might say was an improvement in the ammunition, not in the powder or the bullet, but by a mechanical arrangement being added at the end of the bullet in the barrel. You may say that by an improvement in the ammunition he got rid considerably of the fouling.

897. Have you got any breech-loaders of the bore ·451 or ½-inch at Enfield now ?—No, I have not made half a dozen of them. I think they are all down at Woolwich. I made them for the purpose of conducting experiments, and all that is done down at Woolwich. I have sent them to Colonel Boxer.

898. When you stated that it would take three or four months to do what was required, did you mean also to carry out experiments ?—Yes.

899. Supposing that a given barrel and a given breech mechanism were supplied, and you had merely to attach them together and make the gun shoot, I suppose that that would not take so long ?—No; but what I said was this, that to ring all the changes which might be imagined upon a certain calibre by altering the ammunition, the quantity of powder to be used, the relation of the projectile to the bore, the shape of it, the description of rifling, and all those things would involve to one breech mechanism perhaps 20 or 30 different barrels.

900. But if you had one breech mechanism given, and a barrel given, and you had merely to attach them together, that would not take long ?—That would be only a five minutes' operation; that is nothing; that is merely the mechanical part, but putting other barrels into a breech mechanism to conduct any series of experiments with is what takes up the time.

901. (*Chairman.*) When the Whitworth rifles were tried had they hexagonal or cylindrical bullets ? — There was a store of both, but I rather think that only the cylindrical bullets were issued. I am not quite sure, but some of the rifles were sent to New Zealand and some hexagonal bullets were I believe sent with the other ammunition.

902. Do you consider divided stocks would be strong enough for military purposes ?—I do not like the mode of attachment much, and I cannot say, from want of experience with such stocks, how far they would knock about; the only real trial is the service trial in the hands of the soldier, with constant bumping and ramming into the arm racks, to see whether that will not disturb the mode of attachment. I should be afraid that it would.

903. (*Earl Spencer.*) Do you know whether metallic wads have been issued to the troops ?—Never; it is quite a recent thing with the Whitworth rifle. I think it has been within the last year and a half; there is first the wad and then a metallic washer attached to the base of the bullet.

The witness withdrew.

Col. E. M. Boxer.

Colonel E. M. Boxer examined.

904. (*Chairman.*) You are superintendent of the Royal Laboratory at Woolwich ?—Yes.

905. Supposing that any experiments were required with regard to a new description of arm not determined upon, which do you think would be the first requisite, to fix the ammunition, barrel, or the breech mechanism ?—In a breech-loading arm I think the first thing to be determined upon is the cartridge case. In a breech-loading arm the cartridge case is a very essential portion of the arm itself.

906–7. From your experience do you think that by far the best kind of arm is that which requires a metal-base cartridge rather than a self-consuming cartridge ?—Certainly; it has very great advantages over an arm which is used with a self-consuming cartridge. There are three serious defects in the system of self-consuming cartridges.

908. Will you be kind enough to mention the advantages which an arm using the metal-base cartridge has over others ?—None of the self-consuming cartridges which I have seen are sufficiently strong to withstand the rough usage they are likely to meet with in the soldier's pouch, or in the hands of the soldier. To make them strong enough, it is necessary to enclose each cartridge in a strong covering, something on the same plan as that which was adopted for the Westley Richards ammunition, and also for the Whitworth ammunition. Then if you have this covering you sacrifice one of the most important advantages of the breech-loader over the muzzle-loader, namely, quickness of fire. Secondly, with all the self-consuming cartridges that I have seen, if you have a miss-fire it is necessary to use the ramrod to get the cartridge out. Thirdly, if you did not open the breech block before you used the ramrod the chances are that you have an explosion of the cartridge when the soldier is in the act of ramming down. I think that these are the three principal objections to the system of breech-loading, with the self-consuming cartridge.

909. Are there not other objections, such, for instance, as the impossibility of perfectly closing the breech without the help of the cartridge ?—I think that the Westley Richards' system is a very good one in that respect, so far as my experience goes. I think that it ensures at all times a perfect closing at the breech, so as to prevent the escape of gas.

910. With regard to protecting self-consuming cartridges when carried in the soldier's pouch, do you know how the Prussians and the French overcome that difficulty ?—I do not.

911. I think you stated that in a new arm one of the first things, with reference to the metal cartridge fitting the arm, was to determine the construction of the cartridge case ?—Yes.

912. For what reason do you make that one of the first requisites; is it because it affects the chambering of the rifle ?—It affects the rifle altogether, both the breech-loading arrangement, and the chambering of the rifle.

913. Have you seen breech-loading rifles tried of smaller bore than the present service arm ?—Yes, I have made experiments in conjunction with Colonel

Dixon with arms of smaller bore than the service arm.

914. What bores have those been?—We made a few experiments with the ·450 bore, but not very many; we have made a considerable number of experiments with the ½-inch bore.

915. With which bore did you get the best shooting together with flatness of trajectory and accuracy at long ranges—with the ·450 or the ·500 bore?—My experiments have been so limited with the ·450 bore that I cannot give you a decided opinion. I cannot say that the ·500 bore is better or worse than the other. My impression is, from the limited number of trials I have made, that there will be more difficulty with the ·451 bore than with the ·500 bore; that is to say, more difficulty if the requirements of the service are such as I think they ought to be. If you give up certain important requirements with reference to the arms and the ammunition, it is most probable that a ·450 bore will be found better than a ·500 bore.

916. That is, better with regard to lowness of trajectory and accuracy?—Accuracy in respect to what?

917. Accuracy from 500 to 1,000 yards, and lowness of trajectory up to 500 yards. Do you think in these respects that you will get an improvement in the ·500 bore over the ·451 bore?—If the arms are in both cases perfectly clean, and you are firing only a few rounds, I have little doubt that you would get more accurate shooting from the ·451 bore than from the ·500 bore, at ranges beyond 800 yards.

918. What are your objections to the ·451 bore, as compared with the ·500 bore?—I have no objections to it, but my impression is that there would be greater difficulty in making ammunition for an arm of ·451 bore—that is, ammunition to fulfil all the requirements of the service, according to my ideas—than with the ·500 bore. I think there would be more difficulty in getting ammunition which would not foul after a certain number of rounds had been fired, or to get an ammunition that would shoot well when the rifle is dirty or rusty, or in such a condition as you would most likely have the majority of arms in a campaign.

919. Do you consider that the fouling of an arm depends upon the ammunition? You say that there would be more difficulty with the ·451 bore than with the ·500 bore. Does it arise from the ammunition?—To a great extent it does.

920. In what way would the ammunition in the ·451 bore tend to increase the fouling more than in the other?—We only know from experience that it is so, and that there is more difficulty in preventing fouling. In my experiments I have been able to overcome fouling altogether in the ·500 bore, but not in the ·450.

921. Do you think it may be that the fouling depends upon the bore rather than upon the ammunition for the bore?—I think it would depend, to some extent, on the mode of rifling, and upon the twist in a very small bore. In the ·451 bore you are obliged to have a much more rapid twist than in the ·500 bore; and as you decrease the calibre you must increase the length of the bullet, and consequently increase the rotation. If you increase the rotation—that is to say, if you increase the pitch of the rifling—you get into the difficulty of fouling.

922. You think that the fouling is caused greatly by the increase of twist?—I think so.

923. I believe you have made many experiments lately with cartridges made of compressed powder?—Yes.

924. Do you find the compressed powder answer for a military cartridge?—I have made a great number of experiments with the ½-inch bore, and with that it answered perfectly well.

925. Have you made any experiments with the ·451 bore with compressed powder?—Yes, I have made a few, but very few indeed—not a sufficient number to enable me to give an opinion about the application of the compressed charge. I have no doubt that it would answer perfectly well in the ·451 bore as well as in the ·500 bore, as far as powder fouling is concerned.

926. Therefore, as to the ammunition causing fouling, there would be no greater difficulty with the ·451 bore than with the ·500 bore?—Yes, certainly there would; because the ammunition includes the bullet, and it is the bullet which fouls the piece as well as the powder; it is the combined action of the two. But of course I wish it to be understood that I have not made a sufficient number of experiments with the ·451 bore to be able to give a decided opinion.

927. With regard to the ·500 bore, are you able by using compressed powder to make much shorter cartridges?—Much shorter cartridges; not a cartridge shorter than the present ammunition for the ·577 bore, but we make a shorter cartridge, much shorter than the ·500 bore cartridge filled with the ordinary powder.

928. Referring to the cartridge made of compressed powder for the ·500 bore, what proportionate length would it have compared with the present length of the cartridge for the ·577 bore?—I think the cartridges are about the same length.

929. What would be the proportionate strength of the compressed powder as compared with the ordinary powder?—I have found that about 2¼ drachms of compressed powder are equivalent to 2½ drachms of ordinary powder, with respect to the velocity of the bullet.

930. Therefore it is by diminishing the quantity of powder that you get a shorter cartridge?—In the cartridge I am speaking of as being of the same length as the service cartridge there are 2½ drachms in the charge, and therefore the strength of the charge in that small-bore cartridge is greater than that in the ·577 bore. During the last week I made experiments with a charge of 75 grains of compressed powder, and I found an advantage in the increased charge; the charges of the ·500 bore cartridge which I have experimented with are greater than those in the service cartridge.

931. The charges are greater, and yet the length is the same?—Yes.

932. Is that by compressing the powder?—Yes, I compress it about one-third. When I first started with the compressed powder, I laid it down as a necessary condition that the cartridge should be so firm, that you might hammer it in the pouch for five minutes as hard as you could without breaking up the powder.

933. Is there not an air chamber in it?—Yes, there is a hollow like that in a rocket.

934. Do the grains adhere together by any adhesive matter being put upon them, or is it simply from compression?—Simply from compression; there is nothing but the powder.

935. Therefore there is as little liability to injury by exposure to climate as cartridges made with ordinary powder?—Not more so than with ordinary powder. I think that the one would be affected as much, or nearly as much, as the other by climate.

936. Do you see any disadvantage in using compressed powder?—No, not if you have a strong cartridge, but if you do not have a very strong cartridge you cannot use compressed powder. I find that the effect upon the cartridge case is much greater than it is with loose powder; it increases the strain upon the cartridge case in a greater degree than it increases the velocity of the bullet.

937. Is that because there is quicker ignition?—Yes; there is a more rapid ignition and more of a blow than with the ordinary powder.

938. Is there less or more fouling with compressed powder than with the ordinary powder?—Less, certainly; the rifle is almost as clean after 100 rounds as after the first round; the use of a small piece of dry tow makes the bore perfectly bright.

939. Would not the use of compressed powder enable you to use the small-bore without the disadvantage of fouling?—I cannot say. I am referring to the powder fouling; the bullets I have used have been constructed so as not to foul the piece, and that is my principal object. I do not think it would overcome

Col. E. M. Boxer.

11 Feb. 1868.

the fouling altogether if the rifle and bullet were not correct.

940. Do you consider that with the powder of the ordinary cartridge the fouling is chiefly powder fouling, or is it chiefly bullet fouling?—It is both. I think it is the bullet passing over the powder fouling, which makes such fouling as to interfere with accuracy.

941. If you do away with powder fouling, would you not do away with bullet fouling?—Yes, to a great extent.

942. If you succeeded in that, one might hope that you would get rid of it in the ·451 bore?—I think there is a greater chance of doing it with compressed powder than with ordinary powder. I could not say that you would get rid of it until I have made experiments.

943. It appears that there are two advantages from the use of compressed powder; one is, that you have a shorter cartridge, which is therefore more applicable to small-bores, and the other is, that the powder fouls less?—Yes.

944. Do you know whether the compressed powder has been subjected to any test in the chemical department of the Royal Laboratory?—I do not see what test you could put it to.

945. I mean with regard to the effects of climate upon it?—I put it to a test of that sort, as far as I could do so, but there is no reason to suppose that there would be any difference in the keeping properties of the two powders; you do not add anything to the powder, you merely compress it.

946. With regard to the half-inch bore, what do you consider is the proper charge of compressed powder and the proper weight of bullet to obtain a low trajectory, and combining, as far as possible, accuracy at the longer ranges?—I have got very good results with a bullet weighing 440 grains, and a charge of 75 drachms of compressed powder.

947. That would be equal to about 85 grains probably of uncompressed powder?—About 80 grains. I have brought up the targets if the Committee would like to see them.

948. Do you get a much lower trajectory than with the present Snider arms?—I have not compared the angle at long ranges; at 500 yards I think it is about 10 minutes, that is, in the arm that I have been trying lately, but with the arm which I experimented with some time ago, Burton's, owing to some cause or other, we got a much lower trajectory with the same cartridge.

949. I suppose for longer ranges it might be a heavier bullet than the 440 grain bullet?—That was the reason why I made experiments with a heavy bullet. I fired them up to 800 and 1,000 yards, and the results at 800 yards are, I think, very good indeed.

950. Have you worked out the mean figure of that trial?—These experiments were made with rifle barrels of different pitches; they were made with the object of determining what was the best pitch of rifling for a ·500 bore.

951. Can you mention the rifle that you fired with, and what the mean deviation was?—75 grains I think is the best charge with a 440 grain bullet and 75 grains of compressed powder, the pitch of the rifling being 28 inches, the figure was 9·6.

952. At what range did you fire?—500 yards. Then there was a 380 grain bullet with the same barrel, a 28-inch pitch, and 75 grains of powder, and the figure was 11·7. We find that a light bullet does better with the 42-inch pitch and a heavy bullet with a higher pitch. The wind was one day blowing right against us, and that makes a difference of 15 minutes or more than that at a long range. Then there was the 440 grain bullet with a 36-inch pitch, and the figure was 10·05. At 800 yards, and a 440 grain bullet, weight of powder 75 grains, and a 20-inch pitch, the figure was 34·55. With the same weight of bullet it was 23·50, and that I consider very good. Then a 380 grain bullet, and the figure was 37·35; it did not suit that light bullet. Another experiment was with a 440 grain bullet with a 28-inch pitch, and the figure was 19·70. Other experiments made at that range were pretty much the same. I go now to 1,000 yards; it was not a good day, and the wind was rather variable, with a 440 grain bullet, and a 20-inch pitch, 55·45, and the first target that I got at that range was 42·55.

953. You consider that the best proportion is the 440 grain bullet with a 75 grain charge of compressed powder?—As far as I have gone yet, I have got much better results with that weight of bullet and that charge of powder than with any others.

954. Have you tried the ·451 bore sufficiently to obtain any data as to the weight of bullet and charge of powder to be used?—No. I may mention that the weight of a bundle of ammunition with the light bullet of 380 grains, containing 60 rounds, is a pound less than 60 rounds of the service ammunition.

955. That is, for the ½-inch bore?—Yes; and with the 440 grain bullet it weighs about half a pound less.

956. From which description of rifling do you get the best results with the ½-inch bore?—The rifles I have used lately have been those supplied to me by Colonel Dixon, rifled on the same plan as the short naval Enfield; but I got rather better results, some time ago, from Burton's rifle.

957. In what respect did that differ?—I do not know.

958. Is it not in the chambering?—I think there are six grooves, but the grooves are not quite so deep; however, I cannot speak with certainty upon that point. The chambering is a little different; it is rather smaller at the top, I think, than the chamber of the service arm.

959. Do you know the Metford system of rifling at all?—No.

960. Nor the Whitworth?—I do.

961. Are you of opinion that the Whitworth rifling for the ½-inch, or for the ·451 bore, would produce better results than the rifling you have already reported upon?—I have tried the Whitworth rifling with the ·451 bore. I commenced, in fact, with the Whitworth rifle, and I have made experiments also with the Lancaster rifle. I found that the Whitworth rifle fouled very much more than the Lancaster rifle.

962. Was that in firing with compressed powder from the breech-loader?—No, with ordinary powder.

963. You could not, I suppose, try in the same rifle compressed powder and ordinary powder, as it would affect the length of the cartridge?—No; the compressed powder cartridge is much shorter than the ordinary cartridge.

964. With regard to the form of the bullet, is the form of it at all altered for the ½-inch or the ·451, compared with that which you consider the best for the ·577?—The bullets I have described were made on precisely the same principle as the ·577 rifle bullet.

965. Have you not tried a different description of bullet for the small-bore?—I have made a few experiments with solid bullets, but I find that the principle of construction which I have adopted in the ·577 bore cartridge is the best, because there is very much less liability to fouling, and you get greater accuracy than with a solid bullet.

966. You do get fouling when using solid bullets with the ½-inch bore, and even with compressed powder?—I have not made any experiments with the ½-inch bore with solid bullets and compressed charges; they have been with the ·451 bore, and also with the ·577 bore. The solid bullet which I referred to was one larger in diameter than the bore of the rifle.

967. Have you tried any experiments with solid bullets, such as Henry has been using?—Yes. When I first started with the Whitworth rifling I made some trials with the Whitworth bullet, similar to the one used by Mr. Henry, which had paper round it; but the experiments were not very extensive, and they failed.

968. In what way did they fail?—As far as I can recollect, I could not get accurate shooting.

969. From muzzle-loaders very accurate shooting has been obtained with solid bullets?—Yes.

970. How is it that the breech-loading system has, as one may say, affected the composition of the bullets?—I think one reason is, because in a muzzle-loader the bullet is in the barrel, but in a breech-loader, if you secure the bullet properly, it must be in the chamber. I believe that if you put the bullet partly into the barrel you will get better results than when it is in the chamber.

971. Why should it not always be put partly into the barrel?—If you did not have your lubrication on that part (*describing*) you could do so of course; if you get sufficient lubrication on the part in the rear you can do so, but it is a question whether you can do that.

972. Is it not difficult to procure lubrication which will stand climate; does beeswax do so?—Yes.

973. When you say that the bullet must partly enter the rifle, how far should it project beyond the chamber?—I cannot tell you that. I was only endeavouring to explain the probable cause of more accurate shooting being obtained with a muzzle-loader than with a breech-loader. I cannot tell you how far you should put it in.

974. In the cartridge that you have invented for the $\frac{1}{2}$-inch bore, do the bullets project at all beyond the chamber?—Very slightly.

975. Are they expanded into the barrel, or are they forced through it?—They are expanded into the barrel; they are smaller in diameter than the barrel, and they are constructed on the same principle exactly as the ·577 bullet.

976. Do you believe that the expansion takes place in the chamber, or in the barrel?—It is rather difficult to say. I believe it enters the barrel before it is expanded.

977. You now make a cavity in the rear of the bullet; is not that to produce expansion, or is it simply with reference to weight?—It is to produce expansion.

978. Have you made any experiments with Metford shells?—I have not. The Metford shell would be, except the shell part of it, precisely similar in construction, with a hollow in the head and in the rear, as in the other bullet.

979. Do you see any objection to the Metford shell being used generally by the troops?—It would be more expensive, I think that is the only objection.

980. It has less penetration, has it not?—Yes, less penetration, after it explodes.

981. With regard to the composition of bullets, do you consider that pure lead is better than hardened bullets?—That depends a great deal upon the rifling and the size of the bullet. I do not think there is anything to be said against pure lead.

982. When you say that it depends upon the rifling and the size of the bullet, is that less or more applicable to small-bores?—I cannot say. I have made a few experiments with hardened bullets in order to obtain increased penetration, but I found that as the hardness of the bullet increased there was less penetration; it was not a solid bullet that I used, but one constructed upon the same principle as the ·577 bullet, with a hollow in the front. With a solid bullet I do not doubt that greater penetration would be obtained.

983. You know of no disadvantages in hardened bullets?—No, except that it is more difficult to make them, and they are rather more expensive.

984. What would make them more expensive?—The material which you harden them with, for instance, tin would make them considerably more expensive; if you use antimony you would get a hardening, but even then the compound bullet would be more expensive than the lead bullet.

985. The bullets could be pressed out as the present bullets are, could they not?—Yes, but still the dies would wear out sooner; we do make hardened bullets now; the Westley Richards bullet is hardened with tin.

986. Do you consider it is better that the bullet should be naked, with wax held in cannelures, rather than that it should be covered with paper, with the paper holding the lubrication?—I do not see how you are going to use a bullet with paper round it, if you fasten the bullet properly into the case.

987. Would there be any difficulty in fastening it?—I do not see how you can fasten it.

988. The Henry bullet, for instance, has paper round it, but yet it is fastened tightly into the case?—You might have it fastened tightly into the case if you were making a few thousands only, but not if you had to make them by the million.

989. Then, in fact, the Henry cartridge could not be made up if it had to be made by the million?—You certainly could not depend upon the bullet being held with sufficient firmness in the case by its merely fitting the case; for we are obliged to allow considerable limits in the diameter of case. Of course if you had them made by skilled men, quietly and carefully, you could get them all made exactly the same size, but if you had to get them made by millions, perhaps even working all night, and employ children not skilled in making up these things, they would not be made sufficiently exact in size; you must have some positive mode of fixing in the bullet. I commenced originally with a bullet precisely of that kind, with paper round it; in fact the bullet of the service for a muzzle-loading gun; and I found when I came to knock them about in a pouch, the cartridges very soon got injured; I came to the conclusion that it was necessary to fasten the bullet positively by choking the case into a cannelure of the bullet.

990. Do you consider that the ammunition ought to stand rattling about for a long continued time in the soldier's pouch when not confined in packets?—I think it a very great advantage indeed. I look upon it as a necessary military condition which ought to be insisted on.

991. But ought that advantage to outweigh other advantages, for instance, with regard to shooting?—That would depend upon circumstances.

992. Do you consider that the shooting qualities of the ammunition ought to be sacrificed to the ammunition being able to stand rattling about in a soldier's pouch when not wrapped up in packets?—I would test the accurate shooting with ammunition which had been knocked about in the pouch. I should determine the shooting of the arm with ammunition which had been subjected to such treatment, and the arm should also be in a state in which it would ordinarily be on service. I should not think of testing the accuracy of the shooting in a military arm under conditions which were not likely to be fulfilled as a rule on service.

993. Would you not be putting the ammunition for breech-loaders to a much more severe test than it was ever supposed the ammunition for muzzle-loaders would be put to?—Yes.

994. In the ordinary way; the ammunition would remain tied up in a soldier's pouch?—In my opinion it ought not on service.

995. And it would be only on extraordinary occasions that the ammunition would be loose in the pouch?—Yes; but if you carry your ammunition tied up, you would lose the advantage of quick continued firing. I think that the principal advantage of the breech-loader is the rapidity of the fire; therefore your cartridges ought to be in such a state that you can readily get at them.

996. In order to obtain satisfactory experiments, do you consider that a good method would be to lay down the rifling and the bore, and leave the chambering to be determined by the length of the cartridge?—No, I think you must settle upon your cartridge case before you do anything else; in fact, before you can start to make a rifle at all, you must say what the cartridge case is to be.

997. Having fixed upon the cartridge case, what should the next step be?—The next step would be to ascertain whether compressed powder could be used, as the use of compressed powder would very much

Col. E. M. Boxer.

11 Feb. 1868.

shorten the cartridge. With small bores the cartridge with loose powder is inconveniently long.

998. Having taken the cartridge case into consideration, you would fix the charge of powder?—Yes; and I think it would be desirable to try compressed powder, in comparison with loose powder.

999. Are not the experiments which have been already made sufficient to satisfy you?—I am quite satisfied in my own mind, but it is a question whether the Committee would be satisfied with the results I have obtained. I am satisfied, for this reason. The results have been uniformly good, and nothing has occurred during the trials to throw any doubt upon the soundness of the principle of compressed powder arranged as in my cartridge.

1000. Having fixed upon the cartridge case and the compressed powder, I suppose then the weight and form of the bullet ought to be determined?—I do not think you can fix them absolutely; many experiments must be made to determine the construction of the ·451 bullet.

1001. Would you wait for the rifling?—You might fix the weight of the bullet or the weight of the ammunition; you might say that the ammunition should be between such and such weights.

1002. And let the form of the bullet depend on the experiments made with the rifling?—Yes. I think it would perhaps be the best plan to leave that an open question.

1003. The length must also be determined?—Yes. If you insist upon the whole of the bullet upon which there is lubrication being in the cartridge case—that is, not projecting beyond it.

1004. But still, as I understand, you are not quite satisfied, referring to the small bore, that you have obtained the proper shape of bullet?—I have as regards the ·500 bore, but not with regard to the ·451 bore. The results of the experiments I have made with the ·500 bore have been very satisfactory as regards the bullet, but further trials with other arms are necessary to establish the construction.

1005. Have you now barrels of the ·451 bore ready to make experiments with?—No, we have not. There are two barrels, one of which is a Whitworth and the other is a Lancaster, but the chambering is too long for compressed charges.

1006. Therefore you will require fresh barrels?—Yes.

1007. Could you not alter them?—No. I think it would be best to settle upon the rifling in the first instance. If you have made up your mind as to the best system of rifling, it is a great point gained.

1008. Have you given much attention to the locks of guns, and considered whether anything more simple than the present lock could be obtained?—No, I have not. I think, however, in a breech-loader with a cap which is struck by the plunger the action of the lock is better than the action of a spiral spring.

1009. For what reason?—Because it is more sudden; it is more a blow than pressure. With the needle-gun the detonating composition is pierced by a sharp-pointed needle; but when it comes to a blunt needle or plunger, you want more of a blow.

1010. Supposing the spiral spring is adopted you would probably alter the cap to suit the spiral spring? There will always be a liability to missfire with a spiral spring.

1011. Would that be from a defect in its construction?—I have not had much experience in the matter, and therefore my opinion must be taken just for what it is worth.

1012. (*Earl Spencer.*) You have spoken of the comparative merits of paper and metallic cartridges, how does the comparison hold with regard to cheapness of manufacture?—I think that a self-consuming cartridge would be cheaper than the metallic cartridge.

1013. To any very great extent?—I should think perhaps to the extent of 20 or 30 per cent., but then, on the other hand, one would last much longer than the other.

1014. Would it last longer in store?—Yes; it is a much stronger cartridge, and therefore would not be so liable to be damaged. It also resists the effects of climate very much better, and in my opinion would be far cheaper in the end.

1015. Should you be able to use any parts of the old cases?—I could use the cases over and over again, and I suggested that when they were first introduced into the service. I pointed out that there would be a considerable saving, but I believe there was some military objection to it; it was said that it interfered with the drill; but we can use the case three or four times over. The only thing is this, that the case expands a little, and we should have to crimp it in to fasten the bullet; it would not be quite so good as when first made, still it could be used.

1016. We have heard of instances where a place has been besieged, and where the besieged have made their own paper cartridges, would not that be totally out of the question if they required metallic cases?—They would require to have the paper and the bullets. I am speaking now of rifles, not of the old Brown Bess, into which you could put anything; you would require to have bullets, paper, and powder and tools for making the cartridges; you must have all these stores, and therefore you might just as well have the complete cartridges in store. I think this objection to the metallic cartridge ought not to have any weight whatever.

1017. Do you know the difference in weight of 60 rounds of paper and 60 rounds of metallic cartridges?—The weight of the service breech-loading ammunition is only one or two ounces more than that of the old Enfield muzzle-loader.

1018. You have spoken of the causes of fouling; is it the incomplete combustion of the powder in a long cylinder that partly causes powder fouling?—The combustion is not so complete with powder which is burned slowly as with powder which is burned rapidly, and therefore you get more residuum—more of the unconsumed material.

1019. Is not that obviated, to a considerable extent, by using compressed powder?—Yes, it is, in the compressed powder cartridge, by the arrangement of the hollow; if you were to use solid compressed powder you would have very much more fouling than with the ordinary powder.

1020. We have observed in rifles of small bore particularly fouling at the muzzle rather than near the chamber; can you at all account for that?—No, I cannot; I have noticed that the fouling is generally about six inches from the muzzle.

1021. Do you think it has anything to do with the lubrication?—Probaby it may have, if the lubrication is not sufficient on the bullet to lubricate the whole length of barrel. We used to find it very much so indeed with the tallow lubrication in hot weather. The fouling experiments should be made in the summer, when the atmosphere is very dry, not in the winter; you cannot test fouling in the winter.

1022. In the reports upon the Whitworth rifles which have been sent in from different regiments have you observed contradictory accounts, some being very favourable, and some very unfavourable, and can you account for that?—I have not read the reports.

1023. Should you expect that in India the Whitworth rifle would foul less?—I should think it would certainly foul more.

1024. Why so?—Because it is a much hotter climate. It would depend a great deal upon whether the firing took place when the atmosphere was moist or dry; you get fouling when there is an east or north-east wind, much more than with a south wind.

1025. Were the experiments you made with ammunition which had been made up at the Royal Laboratory, or was it supplied by Whitworth?—It was made up in the laboratory.

1026. Was the lubrication applied?—Yes, it was; we made the whole of the cartridge in the laboratory.

1027. Was the lubrication pure beeswax?—No. I think it was on the bullet, and there was a wad of

beeswax and tallow at the base ; but I am not quite sure about that.

1028. Was there one of the metallic wads attached to the ammunition ?—No.

1029. Might the failures possibly be accounted for by the absence of that wad ?—I have not seen the metallic wad you refer to.

1030. Are you able to say whether it could be applied to military ammunition ?—It could be applied, but it would be very expensive; it consists I believe of two small discs, with tallow between them, very similar to my lubricator for the Armstrong gun.

1031. Is there any reason why the Whitworth muzzle-loaders should foul more than the Westley Richards breech-loaders ? — Yes. In the Westley Richards breech-loader the barrel is cleaned out every time with a greased wad ; the greased wad is forced through the barrel by the bullet.

1032. Having the same system of rifling, there could be no difference in that respect ?—No ; but the base of the bullet is larger in diameter than the bore of the rifle in the Westley Richards.

1033. Have you obtained good results from the Westley Richards ·451 bore ?—It shoots very well indeed as a rule, but we got into great difficulties with the Westley Richards rifles in cold weather. There is great difficulty in getting the cartridges home.

1034. Was that from the lubrication getting hard, or the casing of the cartridge getting hardened ?—It was from the size of the bullet ; but then if you decreased the size of the bullet, and made it easy to load in winter, you lose accuracy.

1035. Do you think that beeswax is the only good lubricant for a military weapon ?—Yes. I think that fact has been established beyond a question. It was a very serious question about eight years ago, but the experience we have had of it since that time has been sufficient to establish beeswax as the only proper lubricant for military ammunition. We had had experience of grease before that, but it was found to fail altogether as a lubricant, and on that account beeswax was introduced.

1036. What effect had the grease upon the bullet ? — The grease disappears in a hot climate, and, secondly, it corrodes the bullet to a certain extent. I do not think so much of the corrosion ; it is more the disappearance of the grease ; it disappears after a time, and there is no lubrication on the bullet when you want it.

1037. Have you ever tried oil as a lubricant applied to a wad ?—No, I have not tried a wad, because that would not do with an expanding bullet at all ; it would stick into the hollow and project and destroy the shooting. It might be possible to use a wad with a solid base bullet, but I have not made any experiments with a solid-based bullet and a wad.

1038. Is it not rather an open question, referring to the present Snider gun, whether the bullet may not be first expanded into the chamber and then forced through the barrel, even though the bullet is smaller than the barrel ?—I know that there is no fouling, and if it was forced through there would be fouling, because the lubrication would be scraped off. I think that the absence of fouling is a positive proof that it does expand into the barrel, and besides this there is no lubrication left at the end of the case. If you put a bullet in larger than the bore there is a great quantity of lubrication left at the end of the case, and the rifle fouls.

1039. Is the wad in the Westley Richards cartridge the only means of obviating the fouling ?—I believe that the wad in that cartridge cleans out the fouling every time it is fired ; it is in front of the bullet.

1040. You do not believe that the complete expansion of the bullet takes place, say, five or six inches from the chamber ?—I think it takes place sooner than that.

1041. Have you never tried any experiments by cutting down the barrels to ascertain that ?—No.

1042. Have you come to any conclusion as to which is the best twist, an increasing or uniform twist ?—No, I have not. Colonel Dixon has paid more attention to that than I have.

1043. If you settled what was the best twist for the ·500 bore, it would not follow that the same twist would be the best for the ·451 bore ?—No, the ·451 would probably require a greater twist if the bullet was longer.

1044. Were all the experiments you have made with the ·500 bore with the present bullet ?—Yes, the present construction of bullet.

1045. If you used a solid-headed bullet, would that entirely alter the experiments ?—I could not then get such accurate shooting.

1046. Have you tried it ?—Yes ; and I did not get such accurate shooting as I got with the hollow-headed bullet.

1047. I suppose a solid-headed bullet like the present one very much affects the question of penetration ?—Certainly; there is less penetration with a hollow-headed bullet than with a solid one, but not to any very great extent.

1048. I suppose the smashing power of a bullet does not entirely depend upon the weight of it, because you can get very great smashing power with a heavy charge of powder and a light bullet ?—Certainly.

1049. Some persons entertain the notion that a very small bore bullet would go through rather than destroy; do you think that entirely holds good ?—No, I think not.

1050. The present cartridge case is quite strong enough, is it not, for a large charge of compressed powder ?—Colonel Dixon has used, I believe, 300,000 cartridge cases of the same description as the service cartridge case in proving his arms, and with compressed powder, 5 drachms of powder and a 750 grain bullet, and there has not been a single accident of any sort as far as the cartridge is concerned. That, I think, proves that the construction of the case is sufficiently strong to stand almost anything. The only difficulty I have had to contend with has been the cutting of the case occasionally ; the case will cut round the base cup, and with this construction of case more than with other constructions ; but that is entirely overcome in the service cartridge, and I have now overcome it with the small-bore, if the chamber is correct.

1051. Does it prevent extraction ?—Occasionally, but very rarely a part of the case is left behind, and then you have to pull it out with the finger; it is a question only of arranging the cups and the coils. I have been using rather a larger charge and a heavier bullet than I have been accustomed to do, but that difficulty has now been overcome.

1052. Have you seen the Lancaster rifle much experimented upon ?—No, I have not.

1053. Not the small-bore Lancaster ?—No.

1054. Do you think that the rifle which is used by the Royal Engineers is as good or better than the service rifle ?—I do not think it better. I think it is as good, but not any better.

1055. Do you think the shooting is as regular?—The Lancaster shoots very well, but there is an occasional drop shot ; in this respect it is perhaps inferior to the Enfield.

1056. You would hardly recommend any particular kind of rifling as the best suited for military purposes ? —No, certainly not. I have not had sufficient experience to form an opinion.

1057. Do you think it is still desirable to have further experiments made as to rifling and as to calibre? —I think so.

1058. (*Mr. Ross.*) You probably think that, provided the calibre is the same, there are various systems of rifling that would give equally good results ?—I suppose so, but I have not had much experience in the matter.

1059. Do you think you get as good results with a cannelured bullet having lubrication on it as with a bullet wrapped in paper ?—I think so. We get much better results with a cannelured bullet in the Enfield

Col. E. M. Boxer.

11 Feb. 1868.

rifle than with a paper-covered bullet; that is, with breech-loader.

1060. Have you ever tried the plan of fastening the bullet into the cartridge by having the bullet slightly tapered?—No, because the tapering would be the wrong way to fasten it in. You must make it larger at the top than at the bottom.

1061. Do you mean that you must have the circumference of the base of the bullet a little larger than the other end?—If so, you could not get it in; you must close it afterwards.

1062. Would there be any difficulty in that?—I do not think there is any necessity to make any provision for that at all. If beeswax be used as a lubrication, a cannelured bullet will, I believe, be found to answer better than a paper-covered bullet. I do not think it is necessary to make any provision of the kind referred to until you have failed with the cannelured bullet.

1063. In manufacturing percussion caps in large numbers can you command an equality of sensitiveness, or is it likely that some of the caps will be more sensitive than others?—There is always that likelihood, and you cannot prevent it.

1064. Do you think that with this system of loading, and the longitudinal sliding-bolt system, there is a danger of accidental explosion when loading?—Certainly. My opinion is very strong upon this point, because I think it is possible that such a thing may happen. I certainly should condemn any system of that sort at once, unless a premature explosion was made impossible; serious accidents have already occurred from this cause.

1065. Even although it was impossible for the piston or the striker to remain protruding, do you think the fact of the bolt pressing the cartridge home might in some instances explode the cap, although the piston was not protruding?—No. If the bolt can only press the cartridge home, and cannot by possibility give it a blow, the bolt system under these conditions would, I think, be a safe one.

1066. I suppose, under any circumstances, you would rather consider the block system, as in the present service arm, or the Henry that works in that manner, safer?—I think so, certainly.

1067. (*Captain Mackinnon.*) Do you think it necessary for a military weapon that a soldier should be able to fire, say 1,000 rounds, without fouling, or even 100?—You might test fouling in this way, or make the arm in a rusty state and then fire a few hundred rounds.

1068. My question referred to fouling from the ammunition?—The reason why I would apply a test of firing a certain number of rounds is, that I should by that means put the gun in such a condition as it would ordinarily be in from rust or dirt. I do not suppose that any man would ever fire 1,000 rounds without cleaning out his arm.

1069. Do you think that if a rifle could fire 20 rounds without any fouling it would be an efficient military weapon?—I do not think 20 rounds would be any test at all, but I would not go to so many as 1,000 rounds. No doubt it would be a great advantage if you could get an arm which would fire 1,000 rounds without any fouling, as an indication of its being of proper construction. The present arm will do this.

1070. Would 250 rounds fired quickly be too severe a test for a gun?—It all depends upon what the weather is when you fired them. If it is a wet day I do not think that 500 rounds would be a sufficient test, but if it is on a hot dry day with an easterly wind blowing, and under a hot sun, then, perhaps, 300 or 400 rounds would be sufficient, for if the gun did not foul then it never would foul—not from mere firing.

1071. You would require two different sorts of bullets for a flat trajectory at short ranges, and for good shooting at long ranges?—I am not quite so sure of that. I thought so the other day, but the 440 grain bullet gives quite as low a trajectory at 500 yards as the 380 grain bullet with the same charge of powder; I believe that the lowness of the trajectory, at ranges beyond 300 or 400 yards, depends much more upon the steadiness of the bullet than upon its weight. If you can get a light bullet which is very steady, the light bullet will have a very great advantage over a heavy bullet which is not steady in flight even at long ranges. If the reverse is the case, and the light bullet is a little unsteady, which would be shown by the shooting, and the heavy bullet is steady, then you will have a much lower trajectory with the heavy one, even at short ranges. In the experiments which I have made the 440 grain bullet shoots quite as low with the same elevation as the 380 grain bullet at 500 yards, which rather surprised me when I first ascertained the fact.

1072. You do not get good shooting with the 440 grain bullet at 1,000 yards?—That depends upon what sort of day it is, whether the wind is high and variable or not.

1073. (*Captain Rawlins.*) Do you think that in a small-bore the chambering should be as small as it can be consistently with the proper working of it?—Yes, I think the chamber ought to be made as small as possible, consistently with easy loading; that is to say, you must be able to load with the cartridge when it is bent to a certain extent.

1074. Do you think that if the paper on the cartridge got wet, it would interfere with that?—No; we have made experiments by placing the cartridges in wet sawdust and mud and water, and it did not make any difference.

1075. Do you attach great importance to paper being on the cartridge?—The only use of it is that it makes it more waterproof; the paper is not necessary.

1076. If it was found to interfere with the working of the chamber, could it be dispensed with?—Yes, it only fastens the coiled metal together; that is all you use the paper covering for.

1077. Is there not always a certain amount of moisture in all powder?—Yes.

1078. Would that affect it in any way if it were enclosed so that the moisture was shut in with the powder; would it deteriorate?—No; it is the normal condition of powder to have a certain amount of moisture in it, whether the powder be in a barrel or in a cartridge.

1079. But the moisture would be shut in with the powder?—The moisture that was in the powder in the first instance would remain with it.

1080. And not diminish?—No.

1081. (*Chairman.*) I think your objection to forcing the bullet through the barrel was that the lubrication was apt to be stripped off?—Yes.

1082. If a solid bullet was used with a wad and a lubricant of oil, would that objection be done away with?—Oil is out of the question; anything but beeswax, I think, would be objectionable.

1083. Why do you think oil would be out of the question?—Because it would not be on the wad or bullet when you wanted it. If you depended for lubricating the gun upon anything else than that which will remain in store for a number of years without deteriorating in the hottest climate, when you wanted it it would be absent.

1084. You think oil would not do?—I think it would be worse than tallow. It was found, when I first proposed beeswax, that tallow would only keep for a very short time in a hot climate; all the tallow on the bullet disappeared, and oil would disappear sooner than tallow, there is no doubt about it.

The witness withdrew.

Mr. JAMES KERR examined.

1085. (*Chairman.*) You have, I believe, turned your attention to the manufacture of military arms for some time?—Yes; I have had considerable experience during the last 14 years.

1086. In what capacity have you turned your attention to them?—As superintendent of a small arms manufactory, by machinery, similar in every respect to the factory at Enfield.

1087. Have you made many experiments recently with rifles of different calibres?—Yes; I have had considerable experience in shooting with and making rifles of different calibres.

1088. Have you come to any conclusion as to which calibre is the best to produce a low trajectory, combined with accuracy?—I am pretty well satisfied on that point as to which would give the best results as a muzzle-loader.

1089. Do the same conditions apply to a breech-loader?—I do not think that small-bore breech-loaders have been tried sufficiently to arrive at a definite conclusion, although I have had considerable experience in using them.

1090. With what results?—The shooting has been more accurate and the trajectory lower with the small-bore than with the large-bore, but there are other difficulties to be taken into account.

1091. With what sized bore have you experimented?—I have experimented with the ordinary small-bore (451), and also with the Chassepôt rifle (·433).

1092. What difficulties did you find as peculiar to the breech-loader?—The difficulties (assuming the question to apply to small-bores) are in extracting and in the damage done to the shell of the cartridge by the greater force of the explosion from its being confined in a smaller space.

1093. The difficulty, I suppose, is in the length of the cartridge?—It is in getting it out. I find that we must have a much smaller margin in chambering a small-bore than a large-bore on account of the strain being greater on the cartridge in the former than in the latter. I find things occur with the small-bore which do not occur with the other.

1094. That is to say, you think the cartridges must fit the chamber more accurately?—Yes.

1095. Have you formed any opinion as to which is the best system of rifling?—I think that provided the number of grooves be not less than five and the cylindrical boring be retained for the lands various systems of rifling would give results nearly alike. I think that the great thing to arrive at is, the proper pitch of spiral, and to have shallow rifling; something into which the bullet would expand in an easy and simple form.

1096. What do you think is the proper pitch of spiral?—We prefer 20 inches, but that is for mere accurate shooting. I do not think it would be so well suited for military purposes as for private practice, it is really drawing out the real merit of the rifle barrel, which perhaps could not be carried out so well in the hands of the soldier.

1097. For what reason?—The only thing that I should think you might be troubled with would be the fouling, and I think it stands to reason that if you burn a certain amount of powder in a very small bore there must be more fouling matter left in it than in a larger one.

1098. Do you find that the fouling is greater in a small-bore than in a large-bore?—I have not tested the one against the other without cleaning, but I think there would be more trouble with the small-bore than with the large-bore.

1099. With regard to locks, I believe you have given some attention to improvements in the present lock?—Yes, I have been studying that part of the question very closely indeed.

1100. Do you consider that the present lock can be improved upon?—I think it is an utter impossibility. I think it has been so well studied. I consider that the necessary exploding power, with the easiest and most certain way of applying it, can be obtained by the present lock.

1101. Do you not think that you could do away with the sear spring in the present lock, and let the main spring do the work both of sear and main springs?—I should not recommend that. In the year 1851 I made a lock for an inventor in which the main spring acts as main spring, tumbler, and sear spring; the hammer as hammer and sear, the lock-plate being the third part. The objection to the reduction of the number of parts is, that if you break the main spring you break (in the instance just given) three parts of the lock, and if the hammer, two parts. I believe that the great advantage we have gained in this country from the Americans in the manufacture of guns by machinery is in the subdivision of the work, thereby making the operations so simple that any class of labour could be employed upon them. I found when in America in 1856 that the object to be attained was to limit the work to be performed in each operation as much as possible, thereby simplifying the manufacture, and that the parts should be interchangeable. I therefore disapprove of reducing the number of parts in the lock at the expense of each part having to perform two or more operations, and also because it would tend to complicate the manufacture.

1102. Do you see any objection to making locks depend upon a spiral spring?—Yes, the objection is this, whatever weight you make the spring, you must at all times have to pull back that weight in cocking the rifle without any assistance whatever in the form of a lever. If you add to this the increased friction that may be caused by fouling or rust, the act of cocking requires so much force that in the French army the men have not been able to accomplish it without applying the heels of their boots in many cases. I have, myself, found geat difficulty in this respect.

1103. Is not that because the piston is very much clogged by fouling from the self-consuming cartridge?—I allude to the metallic cartridge, from which there is not the least escape of gas; the stiffness arises from the friction of the bearing parts of the striker, which adds very much to the weight of the spring. The spiral spring used in the Chassepôt will not always break the cap. I could fire 50 or 100 rounds with perhaps about 2 per cent. of miss-fires, but that would only be done by jerking the pull. When pulled off gently for accurate firing the power is so much decreased that the striker can be seen moving slowly forward, the miss-fires would then be increased to about 25 per cent.

1104. Have you seen the Chassepôt fired?—Yes.

1105. How do you think it answers with the self-consuming cartridge?—There are frequently miss-fires; it answers very well when the cartridges are taken fresh from the packets, but when they have been carried loose there are frequently miss-fires.

1106. What metal case cartridge have you seen tried in France?—The Boxer cartridge principally.

1107–8. (*Earl Spencer.*) You have seen the trajectory of the Chassepôt and of our small-bore?—Yes.

1109. Which is the lowest?—I have not gone into that. I have shot with the Chassepôt up to 900 metres, and the shooting was not very good. The elevation required did not appear to me to be unusually high, but I have uot been able to compare it in this respect with our small-bore.

1110. On general principles which should you prefer, the Chassepôt bore or the ·451 bore?—I should not be inclined, without making further experiments, to decide in favour of the bore of a military breech-loader being so small as either of the rifles named. I think the bore should be a little larger than our small-bore, say ·5.

1111. Do you think the miss-fires you have spoken of were caused by rust?—No, from want of power; there was just sufficient power to drive the needle forward, but it was not equal to break the cap at all times.

1112. Perhaps the spring was not quite strong

Mr. J. Kerr.

11 Feb. 1868.

enough.—It was strong. The loss of power was from the friction of what was attached to the cocking. If they were to make it stronger they could not work it with the hand.

1113. Have you heard of the same drawback or defect in the Prussian needle-gun?—No, but I do not think that they would have the same difficulty from the needle, because there is less power required; the needle will penetrate, and that is all that is required.

1114. Is the spiral spring in the Chassepôt well protected from damp?—Perfectly so.

1115. Have the guns been specially exposed to the weather in order to try them?—Not that I am aware of. What I speak of have been in my own possession; they have been carried backwards and forwards, but not exposed in any way.

1116. Do you attribute the miss-fires to the spring being originally weak, or from having become weak from fouling?—I attribute them to the spring having been too weak originally, but I do not think it would admit of being strengthened, from the difficulty there is in cocking; weak as it is, there is very great difficulty in raising the hammer, and I understand it is quite a common occurrence to see the French soldiers using the heels of their boots to start it.

1117. Have they adopted the metallic cartridge now in France?—They are going on with experiments at present.

1118. (*Mr. Ross.*) Supposing that we wished to try some different specimens of breech mechanism in rifles with the same description of barrels, and suppose the barrels ready made, how long should the inventor of the breech mechanisms take to apply them to the barrels?—If they were all ready it would take but a very short time.

1119. If they were not all ready what length of time would it take?—I could not tell unless I knew what the breech systems were; but if they had the breach mechanisms ready there would be no trouble. If I had them all ready it would only be a matter of a day or two. You would not want them browned I suppose? It would be only to screw the barrels into them? I think that all the guns that I have seen have had the barrels screwed into the system.

1120. Can you obtain from a breech-loader as good results as to trajectory and accuracy as from a muzzle-loader?—No.

1121. For what reason?—There is a loss of power in the breech-loader.

1122. How do you explain that?—I go by this: I think there is no doubt that the "Boxer" cartridge is much superior to all other cartridges in regard to power, and I attribute that to its ease of expansion; the shell of the cartridge is so easily expanded to the walls of the chamber that less power is lost with it than any other metallic cartridge. If a great amount of force be required to expand the shell of the cartridge the bullet would move forward before the full expansion would take place, and, consequently, shooting power would be lost. It may to a certain extent be compared to the shooting obtained from iron and from steel barrels, in one the trajectory is very different from the other.

1123. You would get a lower trajectory from the steel barrel than from the iron one?—Yes, that I think is quite clear; you may show that by the ordinary rifle, in the sighting.

1124. I suppose that if a rifle were made with a steel barrel you would have a lighter barrel with the same strength than in a heavier barrel made of iron?—I should not reduce it in thickness, but you would get what you say, as you would have a more dense metal.

1125. Have you experimented both with steel and iron barrels?—Yes, both in America and in this country, and I know that the advantage of shooting with a low trajectory from a steel barrel is considerable.

1126. (*Earl Spencer.*) What do you consider to be the cause of that?—Before our volunteer movement was started there was a strong rifle club in connexion with the Victoria rifles, and they were introducing steel barrels made by a maker in Glasgow, and these rifles used to be excluded from certain prizes on account of their superior qualities and the lowness of the elevation, but this happened 10 or 12 years ago; it is perfectly well understood now by all gunmakers that such is the case.

1127. Can you give the reason for it?—My opinion is, that the superiority of the steel over the iron barrel is entirely in the greater density of the former metal. A certain amount of expansion takes place each time the rifle is discharged; this expansion is less in steel than in iron, and, consequently, gives greater shooting power.

1128. That is to say, the steel barrel will offer greater resistance?—Yes.

1129. (*Captain Mackinnon.*) Do you think that divided stocks like those used by the Americans are strong enough for military purposes?—I believe there have been many experiments made in the United States as to that, to see which would break most readily. If you had additional metal, I think you might get them strong enough. There have been 7,000 "Sharpe's" carbines made with divided stocks for our service, and I am not aware that the stocks have been found to be too weak. My explanation in reply to the questions concerning the ordinary lock may not be clear, I would, therefore, beg leave to submit to the Committee that it is far superior to any other means of exploding that has come under my notice, and that great advantages must arise from having it applied to breech-loaders without its being connected with the breech system. Its being embedded in the stock preserves it from injury from exposure, and it possesses great advantages as regards durability, power, and means of regulating the "pull off." The want of power in the locks in many of the new systems, and their liability to injury from exposure and the process of cleaning, where they are immediately connected with the shoes or systems, would, in my opinion, be fatal to them as military arms. I would also wish to record an opinion as to the alteration that I consider could be made in the weight and proportions of military rifles. The Enfield rifle is undoubtedly one of the best military arms that has ever been produced as a muzzle-loader, but it is clear to me that military breech-loaders must be considerably reduced both in size and weight, and I am convinced that this can be done without detracting from the shooting qualities of the rifle for military purposes. With respect to my remarks on the Chassepôt rifle, I would wish to state that its only defects are in the action of the lock, and in the cartridge being of paper. With these defects remedied it would be an exceedingly good military rifle, as I believe the piston and cylinder system of breech-loading to be the strongest, and also the simplest to manufacture. I also understand that nearly every other plan of breech-loading has been tested by the Prussian government and found to fail. All systems that merely fold behind the base of the cartridge, or that are blocked up in any way, must, to a considerable extent, depend upon the strength of the cartridge for their safety.

1130. Do you think that such stocks would be cheaper than stocks made of one piece?—There might perhaps be a saving in material, what would do for one would not do for the other; but I think that the stock making is the cheapest part of the whole gun, there is a great saving effected by the use of ma-

1131. (*Captain Rawlins.*) Have you ever used the magazine or repeating arms?—I have handled them a good deal and I have used them, but I have not had much experience of them. We are agents for the Ball and Lamson gun, which is a repeating rifle. I have been in communication with them this week in reference to getting on with the arms, and they are still improving them.

1132. Have you seen any explosive bullets fired?—No. I have seen the Metford shell fired, but that was some years ago.

The witness withdrew.

Mr. JOHN RIGBY examined.

Mr. J. Rigby.

11 Feb. 1868.

1133. (*Chairman.*) You have been for some time engaged in the manufacture of military arms?—Yes, but not extensively.

1134. In what capacity have you been manufacturing arms?—My experiments have been directed to matters of precision and range more than anything else.

1135. You have a factory in Dublin, I believe?—Yes. I may qualify what I have stated by saying that I have been engaged for a long time in experimenting on cartridges for breech-loading arms, military and otherwise.

1136. Before endeavouring to obtain data as to the bore and twist of a rifle, I presume it is as well to determine the weight of the arm?—The weight of the arm is one of the first considerations.

1137. Supposing a military arm (a breech-loader) to weigh 9 lbs. 8 oz., what bore do you consider would be the best to obtain a low trajectory and accuracy in shooting up to 500 yards, and accuracy at ranges beyond that distance?—There are many considerations to be taken into account. I think it would be difficult to mention the exact decimal of an inch that would be the right thing.

1138. Do you think that the ·451 bore would be a good one?—Yes, it may be taken, I think, as a good bore for that purpose; but there are other considerations to be taken into account, such as the length of the cartridge, and other things.

1139. Is the ·451 bore as good or better than the half-inch bore to produce lowness of trajectory up to 500 yards, and accuracy beyond 500?—The ·451 bore is better with a limited weight of projectile.

1140. Do you think that the projectile is the first thing to be considered?—I think you must consider that question.

1141. For the ·451 bore, what do you consider to be the proper charge of powder and the proper weight of bullet?—I confess that I feel a reluctance to give an answer *ex cathedra* upon these detached points, because there are so many things to be taken into consideration. I might require afterwards to modify my answers and to give something very different, looking at the question in another point of view.

1142. Generally speaking, what do you consider to be the first requisite of a military arm to produce a low trajectory and accuracy in shooting?—A high initial velocity and a small displacement of air, but I think there is one very important consideration which has not yet been mentioned, and that is the killing power of the bullet, because if you go for range alone you may diminish the bore considerably beyond ·451, but I think you must in the first place take into consideration what amount of killing power on the arrival of the bullet at its object you want to retain.

1143. Suppose we fixed the bore at ·451, what should you consider was the proper weight of bullet and charge of powder for that bore?—At what range?

1144. For lowness of trajectory up to 500 yards, and accuracy of shooting at long ranges up to 1,000 yards?—Those considerations are diametrically opposed almost; accuracy of range up to 1,000 yards is opposed to lowness of trajectory at a short range.

1145. That is, with the same description of cartridge?—Yes.

1146. But might you not have these requisites combined by using different kinds of ammunition in the same rifle?—Certainly, that is possible.

1147. To obtain a low trajectory up to 500 yards, and fair accuracy beyond that, what weight of bullet and charge of powder should you think would be best suited?—A low trajectory at the shorter ranges requires a very light bullet, and I do not think that for a military arm you should go lower than 400 grains.

1148. What do you think should be the charge of powder?—There again I must ask you what range you mean?

1149. I am speaking of the same, with a military arm, for a low trajectory?—You can hardly use too much powder, as you must limit the amount of powder, having regard to the breech-loading apparatus, the cartridge, and the convenience of carriage.

1150. Do you think 85 grains would be too much?—No.

1151. Would it be sufficient?—Yes. I think that 85 grains of powder with a 400 grain projectile would make very effective shooting.

1152. Have you tried compressed powder with an air chamber running up it?—No.

1153. If you wished to obtain greater accuracy beyond 500 yards, I suppose a heavier bullet would be required?—Yes.

1154. Up to what weight of bullet should you be inclined to go?—If you had said 800 yards, I should be inclined to say 480 grains. If 1000 yards, 530 grains.

1155. (*Earl Spencer.*) You have spoken about the penetrating power, or rather the smashing power of a bullet for military purposes, but that does not entirely depend upon the weight of the bullet. Cannot you get with a light bullet and a heavy charge of powder considerable smashing power?—Yes, but that is the reverse of penetration.

1156. Would you consider a light bullet and a heavy charge of powder effective for military purposes?—Yes.

1157. You have probably tried experiments with it with regard to large game?—Yes, more especially as to large game.

1158. Is there any reason why you should not apply the same principle to a military weapon?—It would not require to be carried so far for a military weapon; a man is not so tenacious of life as an animal.

1159. I suppose your experiments have been principally made with match rifles?—Latterly they have been more with them than with others.

1160. What bore do you prefer in order to get accurate shooting with match rifles?—The ·450 bore.

1161. You have adopted your own system of rifling, have you not?—Yes.

1162. Is that an increasing twist, or an uniform one?—It is an equable twist.

1163. Have you any objection to state your reasons for preferring an uniform twist to an increasing one?—No; my object in using an uniform spiral is this, I wished to give a rotatory motion to the bullet with the smallest possible amount of pressure between the barrel and the bullet, or the smallest amount of grip, and it appeared to me reasonable that the spiral of the grooves in the barrel, and the spiral of the indentations in the bullet ought to correspond all along their entire length, otherwise the same action would occur as when you screw a screw into a nut of different pitch. The bullet, when expanded by the action of the gases at the breech, moulds itself to the form of the barrel to a certain extent, and in my improved long range rifles, that action is diminished, so that the grip of the bullet on the barrel is the least that will give it rotation. If the bullet in going through the barrel encounters a spiral of more rapid pitch near the muzzle, it will be more apt to strip than if it follows along grooves of the same pitch throughout; that is the theory so far as that part of it is concerned.

1164. Do your rifles require the bullets to fit very nicely in order to shoot well?—No, the bullets fit easily

1165. You would not get wild shots if they were made in very large quantities?—No, but it might be desirable to reduce the hardness of the bullets slighty.

1166. Is your system free from fouling?—Perfectly so.

1167. Is it more free from fouling than if the grooves were cut deeper?—Yes.

1168. Have you tried experiments by firing a great many shots out of the rifle without cleaning it?—I have fired 400 or 500, not more than that.

1169. Out of a muzzle loader?—Yes.

1170. Without the shooting deteriorating afterwards to any great extent?—Yes.

1171. I suppose you do not see any reason why the same system should not be satisfactorily applied to

Mr. J. Rigby.
11 Feb. 1868.

breech-loaders?—I have applied the same system to sporting breech loading guns of different bores—at least an analogous system, based on the same principles.

1172. And with good results?—Yes.

1173. Have you adopted what is called the expanding or forcing system with the bullet?—The expanding system.

1174. Is not the bullet expanded into the chamber before it reaches the barrel and almost upset?—With respect to my system of breech-loading for accuracy, as I have not as yet made it public, I should prefer not to enter into particulars.

1175. You will probably not object to state whether you use a chamber?—No, I do, but as to the way of placing the bullet in the chamber, the proportion of the bore, and the chamber and cartridge, and so on, those are points that I do not wish to enter into.

1176. (*Chairman.*) Have you any objection to tell us whether the bullets should be solid, or whether the hollow bullets now in use are better fitted for shooting purposes?—The hollow bullet is preferable in my opinion.

1177. That is, a hollow at the base as well as one at the head of the bullet?—It is in general a hollow bullet—hollow throughout—I use them in all rifles—a very hollow bullet—a carcass.

1178. Why, theoretically are they better than a solid bullet?—You can attain a limit to the expansion of a bullet in two ways, either by hardening a solid bullet, or by hollowing a soft one, and where one method is not desirable you can try the other. It is not desirable, I think, to harden military bullets much.

1179. Why not?—Because it would diminish their killing power.

1180. Do you consider that beeswax is the best sort of lubricant to place on the bullet?—No, I do not think it is the most desirable for a breech-loader.

1181. I supposed it might be desirable as being the best suited to resist the effects of climate?—I think you have in the breech-loading arrangements facilities for overcoming the difficulties which exist in the muzzle-loader on that score—in the muzzle-loading cartridge the lubrication is exposed, for instance.

1182. Do you think it is a better plan to cover the lubrication with paper, or put it in the cannelures of the bullet?—I can hardly answer that.

1183. How soon do you think your experiments will be completed?—I do not know that a man who follows any pursuit of a scientific character ever completes his experiments, but the time of their completion will greatly depend upon the necessity for completing them, and in my case that is not very urgent.

1184. Do you consider that any improvement could be made in the locks of rifles by substituting a different sort of lock for the present lock, with regard to the main spring and sear spring?—Yes, I think so for military purposes.

1185. Do you think the spiral spring is applicable?—I think so; I would not reject the system that had it, if it was desirable in other respects.

1186. (*Mr. Ross.*) In your match rifles that you make expressly for accurate shooting at long distances, do you use a hollow bullet?—No.

1187. Do you use a solid one?—Yes.

1188. Do you know any reason why the same principle should not hold good with a breech-loader?—No, I do not.

1189. Then the objection which you made just now to a hardened bullet for military purposes was because you thought it would not inflict so severe a wound?—Yes.

1190. On the other hand it would have great penetrating power?—Yes.

1191. A hardened bullet, I presume, necessitates shallow grooving?—Yes.

1192. Do you think that shallow grooving is liable to stand the wear and tear of a military arm?—Yes, I think it could be made deep enough for that purpose.

1193. Your system of grooving I believe is very shallow?—Yes.

1194. Have you had any instances of your rifle having lasted for some years, exposed to rough usage?—No, it is not more than twelve months ago since we commenced to make them shallow, but I have no doubt upon that point.

1195. I understood you to say that the ·451 bore with a bullet of 530 grains gave the best results?—Yes, at 1,000 yards.

1196. You also stated that a lighter bullet would give a lower trajectory at 500 yards?—Yes.

1197. I may conclude from that that every grain you lighten the bullet below 500 grains is done at a loss of accuracy, but rather at a gain of trajectory?—Yes, at a shorter range; my theory is that each range must have a different weight of bullet adapted to it.

1198. For accuracy, do you consider that the ·451 bore has a decided advantage over the ½-inch bore at long range?—Yes, with a limited weight of gun and length of barrel.

1199. If two equally good rifle shots were to shoot a match, one using the ½-inch bore and the other the 451 bore, which do you think would have the advantage?—If both were limited to 10 lbs. the ·451 bore would have a decided advantage.

1200. Have you turned your attention to repeating rifles?—I have.

1201. Will you be good enough to name those that you have tried?—The Henry and Spencer, but more particularly the Spencer.

1202. Do you think that they are applicable for military purposes?—I do, and particularly for cavalry.

1203. Could such arms be easily manufactured?—Yes, with a system of interchangimg machinery.

1204. Like any other breech-loader?—Yes.

1205. Do you think they would stand the rough usage of a campaign?—The evidence which was afforded us during the American war was very favourable in that respect.

1206. I suppose that a long cartridge, or even a longer cartridge than is used in the Spencer repeating arm, would be impracticable as a repeater?—It would reduce the number of shots.

1207. Would not a longer cartridge impede the action?—Yes, a much longer one; the Spencer construction would not be suitable.

1208. What is the charge of powder in the Spencer repeater?—45 grains, in addition to the detonating composition.

1209. Would 70 grains be too much?—I do not think it is suited to 70 grains, not as to the ½-inch bore.

1210. Could you shut off the magazine and load the piece independently as a breech-loader?—Yes. The Spencer gun has been very recently improved by an alteration and a new extractor, and they work exceedingly well, and that is one reason why I said I thought they would be useful, especially for cavalry, as a long range would not be so essential for them.

1211. I suppose it could be so arranged that it could be loaded as an ordinary breech-loader with a long cartridge, and have also shorter ones in the magazine?—Yes, we could do that easily.

1212. (*Captain Mackinnon.*) As I understand, you have not yet perfected your system of breech-loading?—I have not adopted any particular system of breech-loading for military purposes; my experiments have been general, and applicable to any breech-loader, with respect to the cartridge, the bore, and the method of rifling, and so on, so as to get the best results with any system of breech-loading.

1213. Suppose that different systems of breech mechanism were sent to you, which were approved of; how long would it take you to attach barrels to them, or could you fix the barrels on?—Yes; my business would be to rifle the chamber and barrels, and provide the best ammunition that I thought the most suitable to obtain the best results.

1214. Would it take you long to rifle the chambers and to fix the barrels on to the breech mechanisms?—No, it would take a very short time. The ordinary Snider Enfield can be altered to a small-bore gun with new barrels, and I believe the Belgian Government are doing something similar now.

Mr. J. Rigby.
11 Feb. 1862.

1215. Do you know the Boxer cartridge ?—Yes.

1216. Do you think that the first thing to lay down is the weight of lead in the bullet, and from that to work up every other part ?—That is a most important point, the weight of lead.

1217. Is it possible, do you think, to make a small-bore breech-loading rifle shoot without fouling ?—I think it is.

1218. Does it not depend altogether upon the cartridge ?—In a great measure it does, and on the rifling.

1219. But chiefly on the cartridge ?—It depends upon a combination, the cartridge, the rifling, and the chambering.

1220. (*Capt. Rawlins.*) You have spoken of attaching barrels to different sorts of breech mechanisms with the view of ascertaining which was the best cartridge to obtain the best results, have you used any paper cartridges in that way ?—My experiments with paper cartridges are comparatively old now. I have abandoned them for some years. I abandoned them before I devoted my attention to a fixed cartridge, such as Colonel Boxer's cartridge. My patent for a cartridge, which is analogous to Colonel Boxer's cartridge, dates from 1861, that was for a coiled metal cartridge case.

1221. All your recent experiments I suppose have been with the metallic cartridge ?—Either coiled metal cartridges or drawn copper cartridges.

1222. (*Chairman.*) Supposing we required some barrels, and that we gave you the length of the cartridge and the bore, would you be willing to furnish us with them ?—Certainly.

1223. How long would it take you to furnish us with those barrels, chambered for your own bullet—could you do it in a month ?—It requires a little consideration, it would depend upon my engagements. These things depend very much upon the weather being favourable for experimenting, because certain data would have to be worked out in the open air.

1224. (*Mr. Ross.*) Have you any preference for any description of repeating arm ?—I prefer the Spencer repeater from what I have seen of it. I have only seen three practical repeaters, and they are the Spencer, the Henry, and the Ball and Lamson. I very much prefer the Spencer to either of the others.

1225. Is it better adapted to stand rough usage ?—Yes, and it is more simple. What I would suggest to the Committee is, that they should try with the same system of breech-loading different systems of chambering, rifling, and cartridges, applying for each to those in the trade who have most studied that special branch, and then placing the different systems in competition. At the same time I think that any suggestion of the kind to the trade would be a failure, unless it was made a matter of business, and that they will not communicate knowledge which they have painfully acquired without seeing their way to some advantage.

The witness withdrew.

Adjourned to Friday next at 11 o'clock.

War Office, Friday, 14th February 1868.

PRESENT:

LIEUT.-COLONEL FLETCHER IN THE CHAIR.

CAPTAIN RAWLINS.	E. ROSS, ESQ.
CAPTAIN MACKINNON.	CAPTAIN HAIG, Secretary.

JOSEPH WHITWORTH, Esq., examined.

J. Whitworth, Esq.
14 Feb. 1868.

1226. (*Chairman.*) I believe you have been engaged for a long time in the manufacture of rifles ?—Yes. In 1854 I was requested by the Government to undertake to find out the principle on which a rifle barrel ought to be constructed.

1227. Have you continued to make experiments from 1854 down to the present time ?—The Committee will see from what is stated in this book (*handing in the same*) that Lord Hardinge employed six of the most celebrated gunmakers in London, each to make a rifle, and those rifles were tried in 1852. They will also find in this book that at 500 yards range the average figure of merit of the six rifles, was 35 inches from the machine rest, and 33 inches from the shoulder—that is the average of the whole six rifles—the figure of merit is given in the book separately for each rifle, but I have kept that in my memory as the average of the whole six. In April 1857, we had our first trial at Hythe against what was then called the Enfield rifle. I may mention, with reference to the question you have just put as to the time I have been employed, that I made a stipulation with the Government that a gallery should be erected in my grounds in which the experiments could be conducted. After the gallery was erected, I completed the rifle as it is now in 18 months—that was just the time it took.

1228. Was the rifle which you then completed a muzzle-loader or a breech-loader ?—It was a muzzle-loader.

1229. With regard to good shooting, do you consider that the same conditions apply to the breech-loader as to the muzzle-loader ?—As far as the rifling goes there can be no doubt about it.

1230. In order to obtain a low trajectory up to 500 yards and accuracy at longer ranges, which bore do you consider would be the best ?—When I commenced, the quantity of powder and the weight of the bullet were given to me—530 grains of bullet and 70 grains of powder. I found that the powder which was furnished to me was a very slow powder, it was the siftings of the cannon powder, for there was no rifle powder made at that time. I found that it did not expand the bullet, and I tried other powder, Hall s powder, and Curtis and Harvey's powder, and I found no difficulty in expanding the bullet with what was termed sporting powder. I adopted a device which enabled me to get at the truth of the matter. After trying many substances, I hit upon bran, and found by firing a light bullet into bran that I could catch it without damaging it, and I ascertained that the powder then used in the service would not expand the bullet—which would very often leave the barrel without taking any rifling. I then was led to adopt the mechanically fitting bullet, putting a small portion of tin into it—about one-tenth. I found very great advantage, particularly in penetration; it gave about three times the quantity of penetration that a leaden bullet would.

1231. In order to obtain the conditions I have mentioned, viz., a low trajectory and accuracy, what do you consider to be the requisites—what bore, what charge of powder, and what weight of bullet ?—

J. Whitworth, Esq.

14 Feb. 1868.

Taking that quantity of powder, 70 grains, and that weight of bullet, I found that the best diameter of bore was four-tenths and a half, ·451 as it is called.

1232. Do you consider 70 grains of powder and 530 of lead to be the best charge of powder and the best weight of bullet, would it not be better to increase the charge of powder?—Yes; the best charge of powder for that diameter of bore is 85 grains of sporting powder, that is the quantity that I recommended for match shooting, and that has been adopted all along at Wimbledon, the weight of the bullet being 530 grains as for the military rifle. The weight of that rifle is 10 lbs., which is too heavy for a military rifle. For a military rifle, about $9\frac{1}{4}$ lbs. in weight, I recommended that the bullet should be 480 grains, and 75 grains of powder on account of the recoil. I also considered that for a military weapon 480 grains was the best weight for the bullet, because the 480 grains and the 530 grains have both the same trajectory with 75 grains of powder at 800 yards. All ranges less than 800 yards being in favour of the 480 grain bullet, and all above 800 yards in favour of the 530 grain bullet, I thought it was a good compromise. The 480 grain bullet will not shoot so well as the 530 grain bullet, and I adopted the plan of boring it up and putting in a wooden plug in order to lengthen the bullet. There is no bullet that will shoot well that is of less than $2\frac{1}{2}$ diameters long, on whatever construction it is made. I think it is better to be between $2\frac{1}{2}$ and 3 diameters.

1233. When speaking of bullets, are you speaking of cylindrical bullets?—I am speaking of every kind of bullet—it applies to all, no matter what their shape is.

1234. When you put in the plug in order to get length, is it put into the base, or into the front of the bullet?—In order to lengthen the bullet, I bored a hole from the front and put in a wooden plug.

1235. Similar to the present service bullet?—Yes, that plan is now adopted in the service.

1236. You consider that the charge ought to be 75 grains of powder; do you mean the same powder which is at present used in the service?—Yes, it is about the same now as Curtis and Harvey's, which we have generally used.

1237. Have you made any experiments with the compressed powder which Colonel Boxer has been using in his cartridges with a chamber running up the centre?—I have made experiments with compressed powder, and I have had very good results from it.

1238. By using compressed powder you are able to make a shorter cartridge, which is an advantage?—Yes, the charge is shorter.

1239. Do you know anything of the relative strength of compressed powder and the ordinary powder. Evidence has been given that it has greater power, that 75 grains of compressed powder are probably equal to 85 grains of ordinary powder?—I have no facts to enable me to speak as to that.

1240. I think you have stated that you consider the same conditions are equally applicable to a breech-loader as to a muzzle-loader?—Yes, as far as the barrel is concerned. I have found it so in small cannon.

1241. Is it not the fact that the shooting from the breech-loaders has rather deteriorated, and that in match shooting muzzle-loaders are always chosen in preference to breech-loaders?—Yes; there is one thing I may mention, that at the first trial we had at Hythe in April 1857, at 500 yards, we obtained a figure of merit of $4\frac{1}{2}$ inches, and General Hay informed me that up to that morning he had never had a figure of merit of two feet.

1242. That was firing with the muzzle-loader was it not?—Yes, and I do not know that that has ever been equalled up to this day, which is a singular fact. I mean out of doors; we have beaten it many times in the gallery. The best figure of merit that I ever had was $3\frac{1}{4}$ inches, we have often had $3\frac{1}{2}$ inches and $3\frac{3}{4}$ inches. On one occasion, taking all the rifles which were sent to Wimbledon, the average was only four inches, so that it is not likely, unless perhaps with gun-cotton, that that figure of merit would be beaten.

1243. When you say, unless with gun-cotton, do you think that gun-cotton is in some respects preferable to powder?—Yes.

1244. In what respects do you consider it preferable?—There is less fouling with it, and it gives less recoil.

1245. When you say there is less fouling, do you consider that fouling is in a great measure due to the way in which the cartridges are made up, speaking of breech-loaders?—I would rather not give any evidence as to breech-loaders. I have not had any experience, and I have no facts to enable me to speak positively.

1246. I presume you have read very carefully the reports which have been published upon your rifles?—Yes.

1247. It is very striking to observe how different the reports upon apparently the same description of arm are from different regiments; some are very favourable, and some are not. Can you at all account for the difference. Were all the arms manufactured in the same place or were they manufactured in different places?—I do not know; we made about 2,000 barrels. But there is one thing that I may mention, and that is, that we never could tell that one rifle was better than another.

1248. I see that some of the barrels were made at Manchester, and some at Enfield?—I was not aware that any barrels were made at Enfield. The barrels we made were made up at Enfield.

1249. Were there not 8,000 barrels made?—We did not make 8,000 barrels; if there were that number made they must have been made at Enfield on the old principle, which might account for the difference in shooting.

1250. I see that all the reports from India are extremely favourable to your rifles?—Indeed. I have not seen the reports that you allude to.

1251. One of the objections to the system made by some of the regiments was, that there was a great deal of fouling and a difficulty in loading, that the men had great difficulty in pushing the ramrod down, a difficulty which I suppose would not exist in the case of a breech-loader?—No. We have never experienced that difficulty if the powder has been good.

1252. With regard to the rifling, what twist do you consider is the best?—One turn in 20.

1253. That is the ·451 bore?—Yes.

1254. With an uniform twist?—Certainly.

1255. Do you still consider the barrels which you submitted in 1857 the best with regard to shooting?—Undoubtedly; the whole thing was completely worked out then.

1256. The barrels, I believe, were hexagonal?—Yes, all hexagonal. Mechanically speaking, there is no form so good or so easily made as the hexagonal when proper tools are employed. I may mention that we are at the present time making 9-inch shot of 320 lbs. weight each, and the wages paid for making the shot ready to go into the gun after casting, is 3*d.* each.

1257. Do you attribute this to the facility with which that form can be obtained?—Yes.

1258. Is it not the case that Westley Richards uses octagonal rifling?—Yes.

1259. But he calls it your system of rifling?—Yes; he had a licence from us. We did not wish to part with the mechanically fitting bullet, and the octagonal form of that small size is not as well adapted for the mechanically fitting bullet as the hexagonal.

1260. For the hexagonal bore of ·451, do you consider cylindrical bullets as well adapted as hexagonal bullets?—No; but I consider that the cylindrical bullet is as well adapted for the hexagonal as for any other form of rifling; the mechanical fitting bullet has a peculiar merit of its own.

J. Whitworth, Esq.

14 Feb. 1868.

1261. Will you be good enough to state what its peculiar merits are?—It admits of the addition of a little tin, and you get by that means three times the penetration through boards. It keeps its form better, and it shoots a little better, however good the powder is. Then again, you can fire a steel bullet which will penetrate half an inch of iron plates, that is an advantage it possesses, and in fact, you can use any kind of bullet you choose.

1262. I suppose the disadvantage of a muzzle-loader for a military arm is that the hexagonal bullet has to be put accurately into the barrel?—No; you cannot put it in wrong.

1263. Is there any reason why it should not be equally applicable for military purposes as other kinds?—No, I conceive not. The cylindrical bullet may be put in anyhow, whereas the hexagonal bullet can only be put in one way; there is that difference.

1264. You do not know perhaps whether the hexagonal bullet would be adapted for breech-loaders?—I am working that out. We sent in a barrel which was not right as to its weight, and we withdrew it; we made a hexagonal cartridge. I have brought it with me (*handing in the same*). I have laid it for the present on one side, as we were not going to compete.

1265. It will probably take a considerable time before you have completed your experiments?—Yes. I am going on now with gun-cotton for small guns.

1266. Do you find any ill-effects from the gun-cotton, because it is more easily affected by damp?—I have not made any experiments with gun-cotton since Baron Lenk was over here. I allowed him to have the use of the gallery, and I lent him some steel barrels; we had some experiments made then which were very satisfactory as far they went, but afterwards I could not get any gun-cotton to go on with; and I have not since renewed the experiments.

1267. Do you know why the Austrians gave up gun-cotton?—I do not know.

1268. Are there 75 grains of powder in the cartridge you have handed in?—Yes, and a 480 grain bullet with a hollow through it.

1269. Would not such a cartridge be expensive to make?—No, unless we had a difficulty in getting the copper thin enough; it ought not to be an expensive cartridge to make, it is very simple, the head of it is all in one piece.

1270. Do you find that copper is preferable to brass?—I must say again that I have not had sufficient experience to speak positively upon that point.

1271. The Americans use a copper cartridge, but they seldom use large charges of powder, it seems that the copper cartridge is hardly strong enough to stand a large charge of powder?—I do not know how that is. We make the base of that out of one solid piece (*pointing to the cartridge*), and we have tried it sufficiently to be able to say that it will stand 85 grains of powder.

1272. Could that description of cartridge be made of uniform quality in large quantities?—I do not see any reason to doubt it.

1273. Of what material is the head of the cartridge made?—That is made of gun metal, which is a mixture of copper and tin.

1274. And turned down?—Yes; it is made very cheaply, as its construction is very simple.

1275. Is the bullet larger than the bore, and does it therefore require forcing into the barrel?—No; it goes in quite easily.

1276. How much of the bullet projects from the chamber into the rifling?—The rifling for this cartridge is all hexagonal; there is no cylindrical part.

1277. Then there is no chamber, I suppose?—Yes; you will perceive that the bullet is smaller than the case, and therefore the barrel is chambered out for the case, but it is chambered out hexagonally.

1278. How far does it project from the chamber into the rifling; about that distance (*describing*)?—Yes; the copper fits right up to the end of the chamber.

1279. What lubrication do you use on that bullet?—We use two discs with a little wax between them, the same as we use for the muzzle-loaders. I designed that cartridge to shoot as well as a muzzle-loader, and it will, with as low a trajectory.

1280. Of what is the lubrication composed; is it beeswax?—Yes; beeswax and a little grease to make it consume the better.

1281. Have you tried any experiments with that cartridge to ascertain whether it will shoot as well as a muzzle-loader?—Yes.

1282. Do you consider that it is unnecessary to have a hollow at the base of the bullet for expansion?—There is very little expansion in that bullet; it is very trifling; only just sufficient for easy loading.

1283. With regard to the locks of military rifles, do you think that any improvement could be made upon them?—Are you speaking now of breech-loaders?

1284. Yes.—I should think so. They could be made more simple.

1285. Do you think there would be any objection to using a spiral spring lock?—No, not in itself.

1286. How would you propose to simplify the present lock for a breech-loading rifle?—That would much depend upon the arrangement for breech-loading.

1287. Might you not entirely change the present lock for a breech-loader?—Yes.

1288. But you have not turned your attention particularly to that point, have you?—No.

1289. As far as I remember, I think the rifle that you sent in was not fixed into the stock by bands?—No; the barrel slid in lengthways.

1290. How is it fastened to the stock?—It is moved backwards and forwards by a lever and toggle joint; it is a description of breech-loader which has been used a good deal in Belgium as a sporting gun.

1291. Have you seen any repeating rifles that you consider good for military purposes?—No. I can give you no information about them.

1292. If the Committee required to be supplied with barrels for experiments, could you furnish them at once?—Yes.

1293. And if we were supplied with your barrels, it might be necessary to chamber them in a different way?—Yes.

1294. In accordance with the length of the cartridge we should use?—Yes.

1295. Would there be no difficulty in that?—No.

1296. Might not that affect the shooting of the rifle?—The cartridge will affect the shooting, undoubtedly.

1297. By shortening the chamber of the present barrel, you would not affect the shooting?—No.

1298. Do you find that your rifles lead at all?—No. The Committee I presume are aware that the Chassepôt rifle has my bore.

1299. Is it not ·433?—No, I am told it is ·451; but it has a lighter bullet—somewhere about 360 grains, but I think that they have made a mistake in the weight of the bullet.

1300. Do you know anything about the Chassepôt, how it shoots?—No; but I am told that it does not shoot well.

1301. It appears that many of the reports made upon the Whitworth rifles that were furnished to the troops are extremely satisfactory, but one or two of them are not so much so. Can you at all account for that?—No. I should hink that there must have been some irregularity in the ammunition—perhaps the diameter of the bullet was too great. Sometimes bad paper will cause a good deal of trouble. I think it must have been from the ammunition being badly manufactured.

1302. But in a breech-loader you would not use any paper?—As I said before, I cannot speak from experience, but I think it would be advisable to use papered bullets, even in breech-loaders.

1303. If your ammunition was properly made up, would there be any chance of the paper coming off?—None whatever, if it is properly made up, but sometimes they get young boys who are learning, to make up cartridges, and then bad ammunition gets passed.

1304. Do you think that occasionally wild shots might occur from a piece of the paper which is put

J. Whitworth, Esq.

14 Feb. 1868.

round the bullet sticking to the bullet in its flight, and throwing it out of its proper direction?—Yes, I think that might account for it, but in the gallery, when we have the ammunition properly made up, we never have a wild shot.

1305. Do you account for that by having had the ammunition more carefully made up?—Yes, and by having everything right. I am speaking of hexagonal bullets. In the gallery all the machine shooting is done with the hexagonal bullets.

1306. (*Captain Rawlins.*) When speaking of wild shots, do you think that the gas, on the first ignition of the powder, could get in front of the bullet, and if so would that be sufficient to account for wild shots in breech-loaders?—I have had no experience except with the one I sent in, and when I found we could not compete I laid it on one side, and the thing has not been proceeded with. I have brought with me some diagrams which I thought might be interesting to the Committee, just to shew them how I have worked the thing out for a small gun, and which of course applies to others (*handing in and explaining the same*). I have already stated in a letter that the gallery at Manchester is at the disposal of the Committee.

1307. (*Captain Mackinnon.*) You would recommend for a military gun a bullet of 480 grains and 75 grains of powder; is that the heaviest charge you would use?—No, I would use a heavier charge if you think the men would stand it—85 grains of powder are what I should like for the ·451 bore.

1308. With a cylindrical bullet of 480 grains?—Yes, because it would give so low a trajectory; the only objection to it is the recoil, but you always find that good marksmen do not care about the recoil, while the others do.

1309. Would you have hardened bullets?—Yes, hexagonal bullets.

1310. Not cylindrical bullets?—No, you cannot have them sufficiently hard, they would not expand.

1311. That is into the hexagonal grooving, but they would into shallower grooving?—Yes, and they might be slightly hardened for the hexagonal grooving, but not so hard as the hexagonal bullets are.

1312. Would the expansion be certain without a cavity in the base?—Yes.

1313. The cartridge you have produced is in a hexagonal chamber, is it not?—Yes.

1314. And the chamber is of course the exact length of the cartridge case?—Yes.

1315. Do you think that pure beeswax is a sufficient lubrication for a small bore?—I think it is better mixed with a little of Price's lubricant—there is I believe no chemical objection to it.

1316. The lubrication must be on the paper case, must it not; it would not answer in cannelures?—Instead of putting it on the bullet, we get better shooting by having it on the wad—it is much more certain.

1317. You have stated that occasionally the paper might adhere to the bullet on leaving the muzzle of the rifle?—Yes, when the lubrication is put on the paper it is more liable to accident.

1318. Do you attribute that to defects in the manufacture of the cartridge?—Yes.

1319. When ammunition is made in very large quantities, must you not expect that there will be defects in the paper?—Yes, I should say so, but still they ought to be very slight defects.

1320. When fouling takes place in a breech-loader, have you observed that it chiefly occurs within a short distance of the muzzle?—My evidence is not worth anything as to breech-loaders.

1321. The Committee have observed a ring of fouling within about six inches of the muzzle, for which it is difficult to account?—When there has been no fault in the barrel?

1322. No discernable fault. Where there is fouling, would you put it down to a defect in the manufacture of the cartridge?—Not invariably. There might be a defect in the barrel.

1323. With your barrel you would put the fouling down to a fault in the cartridge?—Yes. I may mention that in the way that an ordinary barrel is made it is corrected by putting it over a hollow anvil and striking it, and a man looks through it, which is what we call sighting. They predicted at Birmingham that we should never be able to make a barrel as we should not know how to sight it; that was true enough, we could not sight them, but as I bore them out I do not want to sight them. We bore them out of the solid, and we never correct our barrels—they do not need it. The process of barrel making at Birmingham is a process of correction—looking through them and sighting them—so that when you have got a good barrel it depends upon a lucky blow of the hammer. But our barrels are bored out of the solid, and therefore you can depend upon them. They are all right. We cannot detect any difference when they are fired accurately from the machine. That is the great advantage of this plan of manufacture, and I think it is a great pity that it should not be followed up.

1324. With your system of manufacture would it not occupy a great length of time, and be very expensive to produce a large number of arms?—No, you can produce any number.

1325. Do you mean by multiplying the machinery?—Yes, with our machinery we are able to make 50 barrels a week.

1326. Would not the cost be very considerable?—Steel barrels to be made as perfect as they could be wished to be made would probably cost about 25*s.* each.

1327. To be bored out of the solid?—Yes, a finished barrel could be made for about 25*s.* I think we had 2*l.* each for the first that were made, and there have been some made at 30*s.* each. I think they might now be made at about 25*s.* each, if made in great numbers and of steel, and as good as they could be made. Iron barrels cost from 18*s.* downwards, and I have no hesitation in saying that a steel barrel would last out three or four iron ones. You would have the very best thing that could be made, and in my opinion with very great economy. I am waiting until the breech-loading system is settled, and then I mean to try again.

1328. Do you mean the mechanism of the breech?—I mean until it is decided what kind of breech-loader is to be used.

1329. Supposing it was doubtful which of three or four systems of breech-loading were the best, could you adapt your barrels to any of those systems?—Yes, to any system.

1330. And in a very short time?—Yes, all the machinery would come in—it does not matter which system is used.

1331. You have stated that you thought the French had made a mistake, and that they used too light a bullet in the Chassepôt?—Yes, as regards the bullet, it is a mistake. It would be very destructive, as it has a very low trajectory at 300 or 400 yards; but I think 480 grains as light a bullet as you ought to use with a view to its being effective at a long range.

1332. Have you worked out the trajectory of the 480 grain bullet?—Yes.

1333. Can you state what is the highest t of par the trajectory?—I do not remember, but it is exactly the same with 75 grains of powder at 800 yards as the 530 grain bullet.

1334. With the 85 grains of powder that you recommend, there will be a flatter trajectory?—Yes, and the shooting would be very good.

1335. You do not remember what the highest part of the trajectory was with 85 grains of powder and 480 grains of lead?—It was 7 feet 6 inches at 500 yards.

1336. (*Mr. Ross.*) I suppose that, strictly speaking, in order to get the lowest trajectory combined with accuracy at each range, you ought to have a particular bullet for each range?—Yes, of course.

1337. What are your reasons for preferring an uniform twist to an increasing one?—Mechanically speaking, you can get an uniform pitch more perfect than the other; which is a varying curve. I think the diagrams I have shown you, prove that there is really no disadvantage in an uniform pitch or in a

very quick pitch. The Committee will see in the diagrams I have shown that there is one with one turn in 10 inches; that is double the pitch that I ever recommended, and there is no disadvantage in its use; therefore I do not see what is to be gained by an increasing pitch.

1338. It has been stated that in order to get the same rotation with an increasing twist, the bullet may have only to perform one turn in the barrel, whereas with the uniform twist it may have to perform two?—Yes; but that is all imaginary. When you come to work it out practically, you find that there is no advantage; on the contrary, there is an advantage in the other. Most of the advocates for an increasing pitch have imagined that with an uniform pitch, especially when it was quick, you were liable to burst your gun with so great a strain; but the great strain upon any rifle is not in giving the rotary motion—it is in starting the shot. The strain to the gun is in getting over the *vis inertia* of the shot.

1339. Is there as great a strain in firing a shot from a smooth-bore gun as from a rifled gun?—If it is a long shot, I say yes; but it depends much more upon the length of the shot than upon any amount of rifling ever given in practice. The moment the shot is started the gun is relieved, and whether the shot gets one-tenth of a turn or none at all, appears to me to amount to very little. I have had experiments made by drawing a shot through a barrel with different degrees of rotation, and the difference has not been perceptible.

1340. You have tested the resistance in that way?—Yes; but it is all imaginary; when you come to work it out, it has no existence.

1341. I suppose that people imagine, when a bullet takes only one turn instead of two, there is less friction?—Yes. I should strongly advise the Committee to look into this book; they will see what is said about the Purday and Lancaster rifles.

1342. (*Chairman.*) What is that book?—It is a report of experiments with small arms carried on at the Royal Manufactory, Enfield, in 1852.

1343. (*Mr. Ross.*) You are decidedly in favour of having paper on the bullet?—Yes.

1344. In a breech-loader you would still use paper in preference to a naked bullet?—Yes.

1345. Do you think there is a danger of a naked bullet leading the rifle?—Yes.

1346. (*Chairman.*) Do you see any objection to using two sorts of ammunition, one with heavier bullets for a long range, and the other with lighter bullets for a short range?—No, I think that is desirable; and I think I have stated that, in a letter which I addressed to the Committee. Of course, a light bullet is desirable on account of the weight of the ammunition; but in special cases, it might be very desirable to have long range bullets.

1347. You have already stated, I think, that if we were to send you certain breech mechanisms, you could fit barrels to them, but we should have to give you, I suppose, the length of the cartridge?—You would merely have to state what would be the weight of the powder and the weight of the projectile that you had decided upon.

1348. And the description of the cartridge case—would you object to having that given you, whether of coiled metal or not?—No, certainly not. I would strongly recommend you not to throw away simple copper without having it properly tried, because I think the evidence afforded in the American war shows that when the copper is really good (and there is great difference in it) it will stand.

1349. The cartridge you have produced has a much stronger base than the American cartridge, has it not?—Yes, a much stronger base—we made it to stand 85 grains. The base is very important; we make this metal ourselves, but we cannot make the copper. It is turned, and would be made by boys very cheaply, and with very simple tools.

1350. Would you be willing to submit the rifle which you sent to us before for experiments?—Yes, I would be very glad indeed to render the Committee any assistance that I could, without reference to anything except really rendering assistance. I should be very glad, with the knowledge I possess on the subject, to advise you in the matter.

1351. You have a breech-loading rifle which you consider very good for shooting, have you not?—The breech-loading arrangement of rifle that I have I was pleased with as a shot gun. My keeper has one of them, and I know many gentlemen who have them. I adopted it because I thought it as good as anything I could make; but I have put it on one side until I see what is likely to come out.

1352. I understand that although you would be prepared to fit your barrels to breech mechanisms, it is rather a portion of your system to have hexagonal chambers in your rifles, and, therefore, hexagonal cartridges?—Yes; with regard to the bore of this rifle, and to its rifling and the shape of the projectile, I have no doubt whatever it is the best that can be worked out—that I am satisfied of. As to all the other parts, that is quite another thing.

1353. But a hexagonal chamber is part of your system?—Not necessarily. I prefer the hexagonal bullet, but can use either it or a cylindrical one. It might be found desirable for military reasons to use for ordinary purposes a cylindrical bullet of 480 grains, and for long ranges and great penetration the hexagonal bullet of 530 grains.

1354. (*Captain Mackinnon.*) That would require different chambering, would it not?—In the breech-loading arm it would.

1355. (*Chairman.*) Have you any rifle ready now that we could make experiments with, using that description of ammunition?—Yes.

1356. And you would be willing to submit it to the Committee for experiments?—I should wish to do so, but I think it would be much more convenient to make the experiments in the gallery, where there is everything ready. If you like to send down a person, the experiments may be made in the gallery with my rifle, or any other. I would give you the services of a man who is accustomed to this sort of thing, and you would, I think, get on much better, being independent of the weather, and having all the conveniences at hand.

1357. Could the cartridges be made of uniform quality in large quantities?—Yes, certainly, with proper machinery.

1358. (*Captain Mackinnon.*) With a cylindrical bullet partially hardened, which you would recommend, do you think the expansion is given at the first blow of the powder.—Yes; but you will find that one powder will expand a bullet, and another powder will not; that was my great difficulty at first. I was very much pleased when I succeeded in catching a bullet without damaging it. I was then able to see the different amounts of expansion produced by different kinds of powder.

1359. When fired out of barrels of different lengths?—Yes, we worked that out also, and we determined at last upon the match rifle being 36 inches long, as giving the best results. In my experiments with the 2-pounder guns, of which we have been making many, we catch the projectiles and fire them over again; they penetrate fifteen feet into bran, and are not damaged.

1360. (*Chairman.*) Do you consider that you would get better shooting out of a 3ft. 3in. barrel than out of a 2ft. 8in. barrel?—No.

1361. Does the difference not affect the shooting?—No, you get a little better sighting, but you do not get better shooting. I think that a barrel of about 30 inches long will shoot as well as one of 40 inches.

1362. You have stated that the match rifles were made 36 inches long?—Yes.

1363. Why did you give that length?—It is better for accurate shooting, because you get a greater distance between the sights, and then, again, you are obliged to have the weight 10lbs. on account of the recoil.

The witness withdrew.

Westley Richards, Esq.

14 Feb. 1868.

WESTLEY RICHARDS, Esq., examined.

1364. (*Chairman.*) I believe you have been engaged for a long time in the manufacture of military rifles and others?—Yes, both.

1365. You have had very great experience?—A good deal of experience.

1366. The requisites which the Committee consider of most importance in a military arm are, first, a low trajectory, and next, if possible, accuracy at long ranges?—If the Committee will permit me, I will hand in a copy of the qualifications which I have always considered it is desirable to attain, and which I have kept in view in the manufacture of a military arm—each qualification is put into a numerical value. Those under heading "A" may be ascertained absolutely and without doubt; there cannot be any dispute about them. The others, under letter "B," may be more matters of opinion. I put down these qualifications when I began first to consider the question of military arms. I have never been able to obtain any official declaration of what are considered the qualifications a military arm should possess. I think it is most desirable, before we can proceed satisfactorily, to know the opinion of the Committee, or of the Horse Guards, as to what it is they require to be produced. The paper which I will now hand in contains merely my own views as a producer.

The following paper was handed in:

QUALIFICATIONS suggested as essential in a BREECH-LOADING INFANTRY MUSKET.

The weight of the arm, together with its bayonet, has been determined by the Horse Guards, and should not exceed 10 lbs.

The maximum charge should not exceed grains of powder, with a grains projectile.

	Estimated value in Marks.
A.	
1. Flatness of trajectory	150
2. Rapidity of fire, independent of aim	100
3. Accuracy	150
4. Penetration	100
5. Capability of continued firing, and of resisting exposure to wet, &c., without being cleaned or oiled	200
6. Lightness of arm complete	100
7. Lightness of parts by which the breech is closed, including the breech itself	50
8. Lightness of 60 rounds of ammunition	150
9. Least cubic measurement of 1,000 rounds of ammunition	100
10. Cheapness of arm	80
11. Cheapness of ammunition	140
12. Light recoil	30
B.	
13. Strength and durability in all its parts, stock, lock, and fittings	75
14. Strength, safety, and durability of breech-loading arrangement, that arrangement being preferred which requires the least oiling, cleaning, or keeping in repair	100
15. Simplicity and fewness of parts with a view to facilitate repairs by sergeant armourers when on foreign service to whom parts are supplied	75
16. Simplicity and fewness of movements, and those of a nature best adapted to the drill of the infantry soldier, also best suited for loading when flat on the ground, or in defending positions in which it is desirable to get the greatest number of men to fire on a given point at the same time	100
17. Durability of ammunition, its power of resisting in the greatest degree, heat, dryness, cold, wet, and damp	150
18. Ammunition best suited to production by children's labour, in which supply is combined with a power to increase the production to any extent in case of sudden demand. Also such as could be made up by soldiers themselves in case of emergency	100
19. Safety in store and in transit	50
	2,000

1367. In order to procure a good arm, you think that some opinion should be expressed on the points enumerated in the paper handed in?—Yes, I think it essential that we should be informed of the qualifications the committee are desirous of obtaining, and also the proportionate value they set on those qualifications, we should then turn our chief attention to those that had the highest numerical values attached to them.

1368. To produce flatness of trajectory, and accuracy at long ranges, what bore do you consider the best?—I think that ·450, taken as a whole, for a gun to weigh 8½ lbs. or 8¾ lbs., is the best.

1369. Do you think that a gun weighing 8¾ lbs. would be heavy enough?—Yes, I do. I think a very serviceable barrel may be got with a gun weighing 8¾ lbs., the maximum length of the gun being 51 inches; that would give about 3 feet for the barrel.

1370. Do you think that a barrel 3 feet in length would be the best?—I do—better than 3 feet 3 inches, and better than 2 feet 9 inches. We find that we get a lower trajectory with a barrel 3 feet long.

1371. With respect to the rifling and grooving of a barrel, do you still think that what is called a Whitworth barrel is the best?—I never use that. I always use the octagonal. I do not find that the hexagonal form is suitable for breech-loaders.

1372. In what respect do you find it fail?—The grooving of the hexagon, as used by the Whitworth, is too deep for a breech-loader; it makes the angle of elevation high, and the shooting is not good. I have not tried a mechanical fitting bullet, that would require to be used with a metallic cartridge. I have found great difficulty, in particular kind of weather, with the small-bore gun, when a metallic cartridge is used as there is no wad to pass up the barrel in front of the bullet as in the paper cartridge I use, this wad lubricates the barrel and prevents fouling in all weathers. The metallic cartridges which are used without a wad passing up the barrel in front of the bullet at each shot I have found to foul at the muzzle 8 or 9 inches down.

1373. Has that been when firing with Whitworth's bullet with a wad behind?—I have never fired with a hexagonal bullet, but I have tried a greased wad behind other bullets and have not found it prevent fouling at the muzzle of a small-bore 3-feet gun. In trying experiments with a view of diminishing the angle of elevation as much as possible I have found a very shallow rifling with a bullet pushing up into the rifling, a soft wad for fireblock at the base of the bullet, and 85 grains of powder to be the best at 600 yards, I have got a bullet up with 1 degree of elevation, but this gun also fouled at the muzzle after the eighth shot. The bore of the gun was ·450 the bullet was a ·441 bullet made up into a cartridge with a paper forepart and a metalilc base.

1374. When you say that the trajectory was very high when firing with a cylindrical bullet from a hexagon, it was not high, I suppose, in comparison with the present service arm?—No, only in comparison with an arm of the same bore and octagonal rifling. That is my comparison with the service arm. My shooting is the mean of 12 months, both winter and summer, and in all kinds of weather. The shooting there given of the service arm was taken at Hythe by General Hay in my presence on a particular day. I have had occasion to compare my gun with the Remington, which is a ½-inch gun, and that is the result of the comparison, which you will see is in favour of the ·450 bore, the same charge of powder and weight of projectile was used. (See Comparison Paper.)

1375. When the Remington cartridges were fired from this gun, did they perform properly?—Yes, they were all of them good; it is not more than two months ago, and they were made in America.

1376. When you say that you have not tried the mechanically fitting bullet with the hexagon, is there

any objection to it for breech-loaders ?—I have really had no experience. I have never gone into the question. It requires a good deal of machinery to make them, and they require to be well fitted. In a military arm there is great difficulty in working so close, you require some toleration or you have so much waste work. In all my guns I can give plenty of toleration.

1377. Are you decidedly of opinion with regard to cylindrical bullets, that the octagonal form of rifling is the best?—Yes, there is no doubt of it for cylindrical bullets and for breech-loaders.

1378. I think you stated that you get shallowness of grooves by using octagonal barrels?—Yes, I get ·030. I find that that is the best upon the whole. I make my octagonal grooves ·030 deep. I get better shooting, and seldom get any stripped shots. I get sufficiently good shooting, and I think a sufficiently low angle with 70 grains powder.

1379. Do you consider there is no danger of such shallow grooves wearing out?—I do not call ·030, a shallow groove, it is only shallow in comparison with the hexagon, I consider it a deep groove; ·005, ·010, ·015, I call shallow grooves. I do not think that those will wear out in a breechloader as the wear is uniform, but with a very shallow groove if you get a barrel a little too large, you are liable to have striped shots, and if you were to have 3 or 4 striped shots in succession the barrel might lead, which would spoil the shooting.

1380. Is there not a danger of the barrel from continual wear increasing in size, and therefore making the shooting bad?—I never find it increase much. The only difficulty is that everything requires to be made too close for military work when the grooving is very shallow.

1381. For a military arm, what barrel do you consider is the best?—I consider ·450 the best.

1382. With octagonal rifling?—Yes.

1383. And with what shallowness of grooves?—I have found upon the whole about ·030 the best; that is, I should make the receiving plug ·028, rejecting the plug of ·032, leaving that margin, and say a bore from ·448 to ·452.

1384. Do you think that leaving so much margin would not cause a deterioration in the shooting?—I do not find that it does. I have compared the guns constantly, ·048 and ·052; it does with very shallow rifling, not otherwise. If I give 4 thousands (that is ·004) of toleration I can get guns done cheaper than if I only give 2 or 1.

1385. Is it still your opinion that the maximum charge should be 70 grains of powder, and the maximum weight of the bullet 480 grains?—I find that the recoil is rather too much for the 8½ lb. gun; with 75 or 80 grains.

1386. If you increased the weight to 9lbs. 8 ozs., would you object to a heavier charge?—You might, I think, add to the charge 5 more grains.

1387. That would increase the charge to 75 grains?—Yes.

1388. With the same weight of bullet?—Yes.

1389. Would that be suitable for 75 grains of powder?—They do not shoot so well with 75 grains as with 70 grains.

1390. At what range?—At 600 yards. I have never made a careful examination at 800.

1391. Do they shoot as well with a lower trajectory at shorter ranges, up to 500 yards?—Yes, you get a little lower trajectory, I think you hardly want the five extra grains of powder. With my gun, I prefer the light gun and the light charge.

1392. Therefore you are of opinion that for a military arm, 70 grains of powder with a bullet of 480 grains, would be about the best?—Yes, as it enables you to use a 400-grain bullet as well. I have another comparison here which I will hand in, it is a comparison with the Chassepôt in which a projectile of 400 grains is used (*handing in the same*).

1393. With a 400-grain bullet you get a low trajectory at short ranges, do you not?—Yes, but the difference between the two is not so much as you would imagine, you will see by the paper. I have handed in about what it is. The comparison is not an extended one, not more than three or four days shooting—it was done at the time I was trying did the Remington gun. The Chassepot had 85 grains of powder to my 70 grains, and therefore my principle of chamber is, I consider, 15 grains of powder better than the Chassepot gun.

1394. Can you fire different ammunition from the same gun?—Yes, I now fire a 400 grain bullet and a 480.

1395. How do you get an increase of length?—It is the same length, the 400 grain bullet and the 480 grain bullet, the charge of powder being the same, the only difference is in the bullet.

1396. How do you get them of the same length?—I measure to the rim of the bullet; it takes its bearing against the rim.

1397. Is the shape slightly different?—It is the same shape but shorter; the 400 grain bullet is shorter than the 480 grain bullet. I did get them the same length by making the 400-grain bullet hollow, but there was no advantage in it.

1398. Is it your opinion that a solid bullet is better than a hollow one?—I am decidedly of opinion that the solid bullet is better than the hollow one, the penetration is much better, the bullet should also be a hardened one.

1399. Are there no commensurate advantages in the hollow bullet?—I do not see any in the hollow bullet, with a gun of that bore, there may be with a larger bore; with a small-bore a 480-grain bullet is sufficiently long for accuracy.

1400. Have your bullets a cavity in the base for expansion?—No, they are perfectly solid.

1401. Do they expand?—No; they are driven through; they fit the chamber.

1402. Do you consider the principle of driving or forcing, better than the principle of expansion?—For the paper cartridge with a lubricating wad at the base, I consider the principle of a rim at the base of the bullet to be driven through the rifling to be the best; for a central fire-cartridge this rim acts also as a stop and prevents the cartridge being driven forward when the cap is struck; if a lubricating wad were to be fired out in front of an expanding projectile made the size of the bore it would strip. This is our experience and we attach great importance to firing out the lubricating wad in front of the bullet.

1403. And all you have been saying has been with reference to a paper hand-made cartridge?—Yes, except the one I told you of, with which I got an angle of elevation of 1 degree at 600 yards; that was a cartridge without any wad in front, a metallic cartridge. There are two principles of metallic cartridges—there is one with a metallic base and a paper fore part, so that the bullet goes up into the rifling—that is the one with which I can get the best shooting and the lowest trajectory; it is a solid bullet of ·441 with two folds of paper ·006 on the bullet paper being lubricated.

1404. What kind of lubrication do you use?—The same that I have always used; it is a kind of soap. I have used it for 10 years.

1405. Will it stand exposure to climate?—Perfectly.

1406. Have you made any experiments with compressed powder such as Colonel Boxer uses?—Yes, I did some years ago.

1407. Did you find that it was applicable for military purposes?—I did not get such good results as with loose powder, the angle was greater and the shooting not so good from the number of dropping shots, which I attributed to imperfect combustion.

1408. Supposing that the means of removing that dirt and getting rid of other objections was discovered, would you not obtain a shorter cartridge by using compressed powder?—Yes, you would slightly; there is not the least objection to it if uniformity of combustion can be obtained.

1409. One of the objections, I believe, to a small bore, is the length of the cartridge that is used?—In

Westley Richards, Esq.

14 Feb. 1868.

practise I really have never found that an objection. I have made many millions of them, and I have never had a single complaint made about the cartridges, they have been used at the Cape and in India and all over the world for years.

1410. Paper cartridges require to be kept in their packages, do they not. You cannot put them loose into the pouch, and rattle them about for an hour or so, without damaging them ?—You can take them out of their packages of tens and put them into a pouch, and travel them about as much as you like. I think you will find that some reports have been published to that effect. Sir William Wiseman so reported, also Sir Hope Grant in China.

1411. You could not cram them into your pockets very well, could you ?—There is no reason why you should not, it would not injure them.

1412. Would they not break ?—No ; I have never had a single complaint about the ammunition breaking.

1413. Do you consider there is any advantage in ammunition made completely of paper, as compared with ammunition made partly of paper and partly with a metal base ?—I think you can get a lighter, cheaper, and as good a cartridge and it goes into less space.

1414. You mean the paper cartridges ?—Yes.

1415. As to cheapness, what would be the cost of your paper cartridges ?—That is a matter which so much depends upon whether very large quantities are made, and also the price at which you could buy the paper. I use very good paper, I have never tried to alter the paper or get it cheaper.

1416. You might possibly use an inferior kind of paper, if the cartridges were made in large quantities ? —Yes ; you might get a cheaper kind of paper, I do not know if it would be equally serviceable.

1417. Do you consider that an improvement could be made in the locks of rifles, supposing an entirely new arm to be made ?—I think it would be very difficult to get anything more serviceable than the present lock.

1418. I suppose you might get something cheaper ? —Yes ; there would be no difficulty in putting a lock in a block, but you would not get the same action with it, and it would be much more liable to rust, and get out of repair, but it could be done.

1419. Have you seen any spiral spring locks ?—Yes, but I have never been an advocate for them. You cannot get the same action with them as with a main-spring.

1420. Not sufficient action in a spiral spring to explode the cap ?—I have never tried it sufficiently to say, but you do not get so short and quick an action. It is a thing that we have been trying for years to do away with the expense of the lock, but whatever has been tried has never been satisfactory. You get occasionally some springs that are very good, and then you get a quantity of bad ones, and if they remain long in store, they rust and deteriorate.

1421. You think that if they remain in store they will get injured ?—Yes. I think if they have once been rusted from the escape of gas from the cap they will always be liable to it.

1422. By using a paper cartridge, according to your system, with a wad, I suppose you get equally good shooting with a breech-loader as with a muzzle-loader ? —The shooting from the breech-loader is not quite so good as we can get from a muzzle loader, but nearly so, the shooting we now get I consider good enough for a military arm.

1423. What do you think is the cause of the deterioration ?—The whole principle of loading is altered.

1424. Do you get equally good shooting from a breech-loader now as you did formerly from a muzzle-loader ?—We get better shooting now from a breech-loader than we could formerly do from a muzzle-loader.

1425. What principle has been altered ?—One is that you put the bullet down the muzzle of the gun, and the explosion sends it into the grooves ; in a breech-loader it has to pass out of a cartridge into the rifling.

1426. Why are you obliged to drive it through ?— We find the principles of driving through the best, as it tenables us to use a solid bullet and a lubricating-wad ; he one gives penetration the other prevents fouling.

1427. In fact you must force it through to a certain degree ?—On my principle you must force it through, but it can be done without ; I prefer to force the rim at the base of the bullet through, and I do not find that that process increases the angle of elevation.

1428. That is in fact the only way by which you can get rid of the fouling ?—Yes, that is my experience ; I have a gun now that I should think has fired 12,000 or 14,000 rounds. I have placed it in the open air ever since last summer ; it has never had a drop of oil put on it, and it is just in as good working order now as the day it was first put out.

1429. Do you consider that fouling could be done away with by using either other descriptions of gunpowder, or other material, rather than gunpowder ?— That I am not able to say, but the fouling that I find most injures the shooting is on particular days in summer when metallic cases are used with no wad fired out in front of the bullet, the gun fouls at the nose eight or nine inches down, and spoils the shooting, this defect my plan entirely overcomes.

1430. How do you account for guns fouling ?— When the barrel gets hot, a deposit lays hold of the barrel ; when you are loading a muzzle-loader you wipe the barrel down every time, but in a breech-loader this is not done.

1431. Can you explain why it is that the deposit is laid hold of as you say by the barrel 8 or 9 inches from the muzzle, which is not the hottest part of the barrel, why does it not take place lower down ?—I suppose it is because all the lubrication you put on the paper is exhausted by the time it gets down there. I know it is the fact, but it is very difficult to tell the cause of it.

1432. In what sort of weather do you get the most fouling ?—When there is a dry easterly wind.

1433. Not during the frost ?—I do not think we get so much fouling in the winter. I have hardly ever heard a complaint of a gun fouling in the winter ; I thought, when I got the metallic cartridge, to answer for a small bore that I had got a very good gun, and I shot with it all one winter ; I never found that there was anything the matter with it, but in the summer after firing eight or nine shots, I began to get wild shots and this was in consequence of fouling at the muzzle.

1434. I suppose, in order to test a gun, it would be more telling to fire 100 rounds very rapidly, and then fire for accuracy, than to fire 200 rounds with pauses between the shots ?—I should think it was, but I never tried it. I know that the gun I have mentioned, has had 12,000 or 14,000 rounds fired out of it. I could fire 100 rounds out of it, and then fire for accuracy and get good results. Upon the whole I find, by comparing it with any other gun, that I have tried, there is always a great majority of marks in its favor, in every case when compared by the table I have handed in.

1435. It is your opinion that to produce a really good gun, certain requirements ought to be distinctly laid down ?—Yes ; to produce what is wanted I do not say to produce a good gun, but I say that it is the business of the consumer to say what is wanted, and we are glad to produce anything if you will only say what you it is you want.

1436. (*Capt. Rawlins.*) Do you think that compressed powder is the cause of more fouling than ordinary powder ?—I have never tried it sufficiently to be able to say, but I have a general impression about it ; when I tried it some years ago, I did not get quite such good results ; its chief defect was the dropping shots.

1437. Will you be good enough to explain what you meant, when you said that the compressed powder was dirty, did you refer to fouling ?—I do not know whether that was the reason, but I did not find that the ignition was quite so good, and I also found that the vertical deviation was greater ; we tried all sorts of

Westley Richards, Esq.

14 Feb. 1868.

plans to make it ignite better with hollows, we put it in separate parts, in rings, &c.

1438. If cartridges without a wad were used, forcing the bullet would not be necessary, because it would expand in the chamber?—It would not require to be forced then, it would expand in the barrel if pushed up into the rifling.

1439. You could not put the whole of the bullet into the barrel?—No, you can only put the whole of the bullet into the barrel if you make a metallic base to a cartridge with a paper front. There is no question that I can get the best shooting on that principle, and the lowest angle, you require a certain space of plain paper, with an inch or an inch and a quarter of metallic base which you cover, and add to it the paper fore part, the bullet being enclosed in the paper in the same way as in the ordinary paper cartridges, the bullet is pushed up into the rifling.

1440. Do you think that you may account for a wild shot sometimes by the gas getting in front of the bullet?—The gas may get in front of the bullet, unless there is some stop; we always put a fire block or gas check; we put a wad at the base of the bullet, that pushes up into the rifling, with our rim bullet, the rim or base of the bullet fits so truly that there can be no escape of gas past it.

1441. Do you not think it would be possible sometimes?—Yes, with a bullet that goes into the rifling of the barrel, unless you put some stop to prevent it; we always put a wad to prevent it and find it answers the purpose.

1442. Does the expansion take place instantaneously?—I think so.

1443. If the bullet fitted tightly, the explosion would expand it immediately into the grooving, would it not?—Yes, but still there is time for a certain quantity of gas to get past, if you do not put in some gas check.

1444. Do you consider that a steel barrel is preferable to an iron one?—If you make it of a material that you can depend upon, there is no objection to it. I think it is better because it is more rigid.

1445. I suppose there would be no great difficulty in getting the material?—I think not, but the present steel barrels are more difficult to rifle; they are not so soft and uniform as the iron ones. If you get good steel barrels, they are very good, but we constantly get hard places in them. When the question is settled that you are to have steel barrels, and we can do without brazing them, or putting them into the fire, I have no doubt they will be got to answer.

1446. Do you think that a naked bullet is better than one with paper round it?—I have never found it so; I have found that paper is the best medium between the bullet and the barrel.

1447. Why do you think paper is better?—Because I think it holds the lubrication better. In practice we find that we always get the best results with two folds of paper.

1448. Do you think that the barrel would lead without paper?—That I think very much depends upon the inside of the barrel; if you have a rough place in it, it is much more likely to lead.

1449. Do you think that the paper might not adhere to the bullet after it left the barrel?—We never find that to be the case; it may be so with some kind of rifling.

1450. Might you not have wild shots?—Not with an octagon; it is sufficiently large to burst the paper; it comes off in about 30 yards from the muzzle.

1451. Have you made any experiments with repeating rifles?—No, I never have, and I do not think you will ever get a good gun of that kind: it must add to the weight also very much.

1452. Have you tried explosive bullets?—I have tried the shell bullet, but we find that in India they do not care a great deal about them. They use a large bullet there of 900 grains, and 115 grains of powder, and they find that that is sufficient for all purposes—that is, for large game shooting. There is no difficulty in making an explosive bullet.

1453. Do you think that there would be any disadvantage in using them for military purposes?—No, I do not think there would be; they shoot very well.

1454. (*Captain Mackinnon.*) Upon the whole, you prefer your paper cartridge to a metallic one?—I do. I think it is lighter, cheaper, occupies less space, is sufficiently strong for military purposes, and can be made by any one.

1455. They would require a certain supply of wads, caps, and paper of good quality?—Yes, but they are all very easily got. You do not require any machinery—nothing but a stick and a cylinder.

1456. The paper would require to be very good, would it not?—That is not absolutely necessary. We send out with a rifle a couple of sticks to roll the paper on, and a cylinder, and the people make their own cartridges, and we find that that operates as a great inducement for them to have our gun.

1457. Your bullet I think has a rim?—Yes.

1458. In the paper cartridge, does all the bullet go into the grooving, rim and all?—No, it is a taper chamber, and the rim rests against the taper part of the chamber.

1459. Then that is the part of the bullet that is forced?—Yes, there is a slight bite upon it; the force would be very little. The fore part is ·447, and the paper ·006; that gives a very slight bite, but just enough to steady it.

1460. Are the bullets hardened?—Yes, with 1-20th of tin. My gun has been made with a view of combining all the qualifications stated in the paper I have handed in, in the greatest degree.

1461. The twist that you use is an uniform one?—Yes.

1462. Do you disapprove of an increasing twist?—Yes, because it is very difficult to do anything to it. If you get a barrel that is badly rifled, you cannot lead it or do anything to it. We get good shooting out of it, and we used for many years to make nothing but increasing twists. But, as I said before, if you get a barrel that is a little damaged in the rifling you cannot lead it. We cast a plug six or eight inches in the barrel, and then, by putting oil-stone dust on it and working it up and down, we get a barrel into good shape and get cuts out of it; but if you have an increasing twist you cannot lead it, because you cannot get the lead in—the rifling differs in pitch every 10 inches.

1463. You do not object theoretically to an increasing twist, if it gives good shooting?—No, I do not see any harm in it, but I think you put the greatest pressure at the muzzle. We find in practice that they shoot very well and with a very low angle. The theory was that they would not strip, and that the bullet would go gradually into the groove.

1464. Do you put the soap lubrication on the paper round the bullet?—Yes, but we find that the wad is sufficient; we generally do put it on the paper, but it would do without anything. The wad seems to be sufficient at the base of the cartridge to lubricate everything. When the barrel gets warm there is a certain amount which runs down the side of the bullet; after three or four shots, the chamber at the point of the bullet is sufficiently warm to melt the lubrication, and it runs down to the point; it never fouls, and it never requires cleaning. I have had it in India for 10 years, and when it has come back again you might use it just as well as when first made.

1465. Has it also been used in Canada?—Yes, but in Canada you require to have the lubrication made a little softer. I believe I have overcome that difficulty in the breech-loading gun by using a differently shaped hat-cap, which takes the pressure of the wad off the point of the bullet. I have had it out of doors all this winter in the frost, the ammunition and the gun too, and we have found no difficulty in loading it.

1466. In Canada it would have to resist very great cold in the winter and great heat in the summer?—No beeswax will do in Canada with my gun; it becomes perfectly rigid. We sent out to Canada a short bit of wire with a brass ball at the end to push the

Westley Richards, Esq.

14 Feb. 1868.

wad forward, and after a couple of shots it comes all right. If you leave a wad in the chamber and it gets frozen, you could not without difficulty push it up, and to obviate that we have made a little short wire pusher, with which the wad is pushed into the end of the chamber, and then you can load. Our guns are principally used in hot climates, in India and at the Cape.

1467. I think you once used a metal cartridge case about half the length of the powder case ?—Yes, and with that principle I find we get the best shooting.

1468. That is used in a different kind of gun is it not ?—Yes, it is upon a different principle altogether.

1469. Where is the lubrication in that ?—There is lubrication all over the bullet.

1470. Is it on the paper ?—Yes, but that in hot weather fouls at the muzzle ; it shoots very well for about eight shots, and then it goes wild in consequence of the fouling.

1471. Have you tried bullets holding the lubrication in cannelures ?—Yes, and I think that it assists them, but we do not use them because we find fouling even with them, in some weather.

1472. (*Mr. Ross.*) I believe your rifles have generally won the Duke of Cambridge's prize at Wimbledon, the competition being restricted to breech-loaders ?—Yes, that has been with a rifle with a cartridge ignited by a copper cap, such as is at present used in the service.

1473. What was the weight of your rifles that were used at Wimbledon ?—The maximum weight was 10lbs.

1474. Do they generally weigh as much as that ?—No, I think that the majority of them have not weighed more than 9¼ lbs.

1475. What weight of bullet was used in those rifles ?—A bullet weighing 530 grains, and 85 grains of powder.

1476. Then when you said that you preferred 70 grains as the charge of powder, and a 480 grain bullet, that was because you meant a lighter rifle, was it not ?—Yes; I reduce the weight of the rifle, but with the 10lb. rifle I think that the other is the best charge, but I question whether the generality of line soldiers would like the recoil.

1477. I suppose the weight of the bullet has more to do with the recoil than the charge of powder ?—I think the charge has a great deal to do with it, but you can put that into figures and ascertain. I have found that with a gun that weighed 8½ lbs., 70 grains of powder and a bullet weighing 480 grains were quite enough. I think that with three diameters you would get the best shooting.

1478. Do you think it is better, in order to lighten a bullet, to shorten it rather than to make a hollow one ?—I think it better to shorten it, as a cavity deteriorates the penetration, and I find even the 400 grain solid bullets shoot well up to 600 yards.

1479. Have you not made breech-loading rifles without any chamber at all ?—No, I do not think we have made any without a chamber. With regard to the qualifications which are indicated in the paper I have handed in, I may add that the best results have been obtained from paper cartridges.

1480. (*Chairman.*) In the paper you have handed in, I observe that the mark of 150 is the maximum ?—Yes. I may remark that I do not think it is of much consequence the being able to soak the cartridges in water, but I can put mine for a week into water, wrapped up in packages of 10 in indiarubber wrappers.

1481. Has the paragraph with regard to the "durability of ammunition and its power of resisting the greatest degree of heat, dryness, cold, wet, and damp," reference to ammunition put up in packets, or to single cartridges ?—I mean cartridges packed in packets of tens, because they are served out in tens.

The witness withdrew.

Adjourned *sine die.*

War Office, Thursday, 20th February 1868.

PRESENT :

LIEUT.-COLONEL FLETCHER IN THE CHAIR.

CAPTAIN RAWLINS.	EARL SPENCER, K.G.
CAPTAIN MACKINNON.	E. ROSS, Esq.

Captain HAIG, Secretary.

Capt. W. H. Noble, R.A.

20 Feb. 1868.

Captain WILLIAM HENRY NOBLE, R.A., examined.

1482. (*Chairman.*) Will you be good enough to state to the Committee what position you fill at Woolwich ?—I am an associate member of the Ordnance Select Committee.

1483. How long have you held that position ?—Since the year 1861.

1484. During that time have you made many experiments with compressed powder ?—Yes, I have made a considerable number of experiments.

1485. When did you first begin to make experiments with compressed powder ?—Perhaps I had better state briefly what has already been done. Sir William Armstrong adopted a perforated and compressed charge for the purpose of getting more powder into the bursters of his segment shells, so far back as 1860, but the question of its suitability in this form for cartridges was, I believe, first brought to the notice of the Ordnance Select Committee in September 1862, in a memorandum in which I recommended that experiments should be made with *perforated* and compressed charges of *grain* gunpowder. The following advantages were claimed:—(1) increased uniformity ; (2) higher velocity and, possibly, less initial strain on the gun, that is, more uniform strain; (3) reduction in the length of the cartridge, and consequent diminution in the size of the chamber of the arm in which it is used ; (4) the compressed charge without perforations would not be as efficient, as the rear of the cartridge would only be ignited by the first discharge, and the front part would be liable to be blown out of the gun unignited, thereby causing a loss of velocity and fouling ; (5) decrease of bulk and consequent gain in stowage ; (6) facility in making up cartridges ; (7) cheapness of manufacture ; (8) superior hygrometric qualities, as the perforated and compressed charges could easily be waterproofed. The Committee approved of this suggestion, and a certain number of cartridges of perforated discs of *grain* gunpowder were made up for various arms, according to drawings submitted by me, and amongst others for the Enfield rifle. In November 1862 the first experiment was made with the 12-pounder breech-loading rifled gun, firing charges of compressed granulated powder *without perforations*, and the result was that the un-

perforated cartridges gave a very low velocity as compared with the loose powder. These results are given in O.S.C. Minute 7913, Report on Ballistics, vol. I., pp. 83, 84, and prove conclusively the value of the perforations. These unperforated cartridges gave a low velocity and fouled the gun considerably. A preliminary experiment with perforated and compressed charges of granulated powder was made in the latter end of November 1862 and reported on (O.S.C. Minute 7926). The results were so far satisfactory that the O.S. Committee in their Report, 2595, recommended "that steps be taken to "secure the right of the War Office to use the perforated and compressed charges against any person "who may hereafter patent it." To this the War Office solicitor replied, that "If the discovery was "properly recorded at Woolwich or in this department, it would be good against a subsequent patent."

—War Office Papers, $\frac{82}{B}$, Minute $\frac{}{197}$ 8147. On the 6th of January 1863 perforated and compressed charges of granulated powder were fired in comparison with charges of loose powder from the 40-pounder breech-loading gun. The results are given in O.S.C. Minute, 8246, Report on Ballistic Experiments, vol. II., 1865, pp. 61, 62, and proved that when the compressed charges were perforated the initial velocity was practically the same as with the loose powder, and the uniformity much greater than with loose powder. On the 30th of April 1863 I reported to the Committee, Minute 8970, that perforated and compressed gunpowder had hitherto not given such good results as had been expected from it, in consequence of the tendency to foul and liability to break in transit. That was our chief objection to it. But that experiments had proved that the best results were given in small arms by a compressed cartridge with one large perforation down the centre. Various further experiments were carried out from time to time in connexion with this subject—we tried different degrees of pressure—a different number of holes in the cartridge, &c., all of which are detailed in the Ordnance Select Committee's Proceedings, and Reports on Ballistics for 1863, 1865. Among other experiments are those referred to in Minute 12,461, where a number of perforated and compressed charges were tried in the Enfield rifle, on the 27th of April 1863. The details of this experiment are given in my second Report on Ballistics, volume II., pages 65 and 260, and the results proved that a considerable uniformity was obtained by the use of the perforated and compressed charge. The Committee subsequently directed these experiments to be continued with the Enfield rifle, but I cannot trace that anything further was done, and I believe the subject was dropped owing to the contemplated introduction of breech-loading small arms, and the consequent changes in the nature of the ammunition required. These are the Ordnance Select Committee Minutes, which give the results obtained from the powders (*handing in the same*). Last August I carried out an experiment with compressed cartridges in comparison with loose ones fired from the Snider Enfield rifle. They were proof cartridges, strongly made for the purpose of proving the rifles. We fired 137 grains of perforated and compressed powder, with a 720 grain bullet, and I found that the uniformity was very good indeed—that it took 147 grains of loose powder to equal the velocity given by 137 grains of compressed powder. I do not know whether the Committee are aware of the reference which was made by the President of the Ordnance Select Committee, in his Annual Report for 1865, sec. 54, to this subject. General Lefroy says: "The conclusion to be drawn from these "experiments is, that charges of compressed powder "which occupy less space in stowage, and are less "liable to deterioration from damp, are also more "uniform in effect than equal weights of uncompressed gunpowder, give a somewhat higher initial "velocity, and if they are not too hard, are consumed "in the gun without causing more fouling than com-"mon powder. The best degree of compression is "over two tons and under four tons per square inch, "but the precise amount cannot at present be stated. "The prosecution of the inquiry is tedious from the "long time which elapses between every successive "step, but it is not expensive, and may ultimately "lead to valuable results. As soon as any determination can be come to as to the description of "compressed powder to be tried, it will be necessary to inquire into its effect on the endurance of "guns, and probably also to issue a proportion of "infantry ammunition of the same description, for "the advantage of the reduction in length will be a "strong argument in favour of this ammunition for "small-bore rifles, if in other respects it is suitable. "The general reduction in bulk will be an advantage "for transport; the facility of loading in any position "will recommend it; and, finally, it seems probable "that it will be easy to make each charge water-"proof." I consider that perforated and compressed charges will give very good results in breech-loading small arms, and I brought the subject again before the Ordnance Select Committee at the commencement of the present year, and recommended that some experiments should be carried out in this direction.

Capt. W. H. Noble, R.A.
20 Feb. 1868.

1486. That of course refers to experiments made with muzzle-loaders?—Yes, muzzle-loading small arms.

1487. When these experiments were made with muzzle-loaders, I see that you say in your notes that considerable uniformity was obtained?—Yes.

1488. Does that mean that as great uniformity was obtained with compressed powder as with loose powder?—Greater uniformity was obtained.

1489. Have you any other statement to make to the Committee?—No, I do not think I have anything further to state.

1490. You have stated that you have used perforated cartridges of compressed powder, and also that you had perforated discs; what does that mean?—It means that the cartridge was in different pieces, that is to say, the 40-pounder cartridge would be composed, say, of three discs. I should explain that a difficulty was found with the cartridges for large guns in making them all in one cylinder. We overcame that afterwards, but originally there was a difficulty; we called them discs even when they were made in one piece, but the word "discs" only refers to cartridges for large guns. You may call the little pellet a disc, but the word originally came into use because they were made in small discs, three or four together in a cartridge; but all our cartridges for small arms were made in one piece. And the subject was generally headed in our printed abstracts "*Perforated Disc Gunpowder.*"

1491. You have, I believe, recently been trying experiments with compressed powder in breech-loaders?—The only experiment which I have tried was the one I have just mentioned, in which I fired for the Superintendent of the Royal Laboratory proof cartridges from the Snider rifle.

1492. Have you not tried any other experiments besides that?—No; but as I have before stated, I recommended the other day that some experiments should be carried out in this direction, and it was referred to this Committee.

1493. The Committee has been informed, I think, by Colonel Boxer, that 75 grains of compressed powder are equal to 85 grains of uncompressed powder, but the proportions would not appear to be the same, when you say that 137 grains of compressed powder are equal to 147 grains of ordinary powder?—No, it would not be so from the result of my experiment. Colonel Boxer, however, may have made an experiment of his own.

1494. Are you satisfied that the experiment you made is to be relied on?—Yes, but it is a mere matter for experiment. It might be that the 75 grains of compressed powder were equal to 85 grains of uncompressed powder; but it would depend a great deal

Capt. W. H. Noble, R.A.

20 Feb. 1868.

upon the size of the bore of the rifle in which it was fired 85 grains of uncompressed powder in a ·451 bore would form a very long cartridge, whereas with compressed powder it would be a very short one, considerably shorter than in the loose state, and of course with a perforation down the centre, a greater surface of the charge is ignited by the first gas which is developed.

1495. The smaller the bore the greater the advantage you obtain, irrespectively of the actual length of the cartridge, from the charge being compressed?—Yes, within usual limits.

1496. With respect to the shooting qualities of the powder?—Yes.

1497. When compressed, is the powder united together by any mixture of any sort?—Merely by pressure. I suppose the Committee are aware that a number of trials have been made in other countries by various persons. Perforated and compressed cake powder was used in America in 1860, and is fully described in Rodman's "Experiments on Metals for Cannon and Cannon Powder," Boston, 1861, pp. 291–6. Several persons have also proposed compressed charges in this country; one was Mr. Browne, who in 1859 proposed a compressed powder. He mixed it with some kind of adhesive cement; there were, however, no perforations. We have specimens at Woolwich.

1498. For what reason did they mix anything with the powder?—Because they thought that the powder would crumble away and not compress properly.

1499. That I believe has not been found to be the case?—No, it compresses very well indeed.

1500. Does the chamber or perforation which runs up the centre of the cartridge keep its shape after the cartridges have been in use for some time?—I have had no experience upon that point, therefore I cannot say. The cartridges that we used were made up in the Royal Laboratory, and taken directly to the range and fired, but of course that would be a subject for experiment. You must submit the cartridges to a proper trial to see whether they will break up or not.

1501. Do you consider that the compression of the powder tends in any way to render it more liable to be injured by damp if placed in store?—No, certainly not, on the contrary I think you might waterproof the cartridges. I should think it would be easy to do so by a coating of collodion, or some waterproofing substance.

1502. Do you think that compressed powder could be used for paper cartridges?—Yes, I do not see why they should not be. Many cartridges with compressed powder have been made up in paper or in skin. For instance, Dr. Doramus, an American, made a number of compressed cartridges, and they were covered with skin. I do not think, however, that such cartridges would stand transport as well as metallic or "Boxer" cartridges.

1503. Did you see any of them?—Yes, we have specimens of them at Woolwich. They have no perforations in them.

1504. Are they made for breech-loading rifles?—No, they are intended for muzzle-loaders.

1505. Would there not be a probability in cartridges made for breech-loading rifles of the powder being broken and the chamber being filled up; or, in other words, do you think they would be strong enough to prevent the powder from filling up the perforation?—I think that that would be a disadvantage certainly, for instance, compressed powder cartridges, if subjected to rough treatment, would be liable to break up, if they got a fall, for instance, but that is a matter for experiment.

1506. Do metal cartridges made of compressed powder require to be stronger at the base than when loose powder is used?—I have had very little experience in the manufacture of cartridges for breech-loaders, and I cannot exactly say, but I do not see why they should. Colonel Boxer could doubtless give evidence on this point.

1507. I suppose that greater rapidity of ignition is obtained by using compressed powder?—I think so, if the charge be perforated, and particularly in a long charge. You perceive that in a charge, say of 85 grains, with a small-bore rifle, there is a considerable length of powder, and it is ignited at the very head. It takes a certain time for the gas which is first developed to travel through that cartridge; the only way in which it gets through is by penetrating by degrees through the interstices of the grains, and a certain amount of that charge merely acts as a wad; it is, in fact, blown out of the gun. A very long cartridge causes fouling, and you lose velocity by it. I believe it is just the same with rifled small arms as with rifled guns; for instance, the Whitworth gun may be taken to be a small-bore artillery gun in comparison with a gun throwing the same weight of shot with the service rifling. It has a very long cartridge, and in the Armstrong and Whitworth trials which took place in 1864, Whitworth vented his gun exactly in the rear through the cascable, and it was found when the vent was in that position, with an ordinary charge of loose powder, that the initial velocity was 100 feet per second less than in the Armstrong gun, which vented the charge so as to strike it in the centre; but Whitworth got over the difficulty by inserting a paper tube in his cartridge; he put a sort of feeder up the centre of his cartridge, consisting of quick match in a tube, and by that means ignited the cartridge in the centre; he thereby got his velocity up again and regained his 100 feet. It is much the same with these compressed charges which have a long perforation all through them; the gas which is first developed rushes immediately along this perforation and ignites all the surface; a great mass of the charge is thus ignited together, and that gives you more uniformity. In addition to which your cartridges are not liable to caking, which very often produces a wild shot with a low velocity from a long charge of loose powder. The chief cause of these irregularities, I believe, is that a part of the charge gets caked. You will often find in breaking up the cartridges, and especially in a long one, that part of the powder is caked. In compressed powder you have the whole thing caked.

1508. Do you think that you can ensure uniformity in the manufacture of compressed powder?—I can hardly say, but I should think you could; I do not see any difficulty in it.

1509. Do you think the probability is that you would ensure greater uniformity in the manufacture of compressed powder?—I should think so, certainly, and I should think it would be cheaper to manufacture.

1510. For what reason?—I think there would be no loss if you were to introduce compressed cartridges, as you would do away to a certain extent with the niceties of granulation and glazing in making the powder, and you would not have so much waste. In all these processes there is a good deal of waste and expense.

1511. Do you know what description of powder is best adapted for compressed cartridges for rifled breech-loaders?—I should rather be inclined to say powder that was not very highly glazed; I think it is better without so much glaze.

1512. Why do you think so?—Because I think it would compress better. I think that the glazing would interfere with its binding.

1513. Would it be at all necessary to glaze the powder that is used for compressed cartridges?—I do not think so.

1514. Because you could make them waterproof?—Yes, that might be done afterwards.

1515. There would be a saving of expense, would there not?—That again is a matter for experiment. I do not think you could make compressed cartridges—you might be able—actually out of meal powder. I think there might be a difficulty in it, because when you do make it into grains and compress it, if you examine a cartridge under a microscope you will see that there are a variety of little interstices running through the whole cartridge, so that the gas may still get in between and ignite it; but if you were to make it out of very fine meal powder you would do away with

all that. I think, therefore, that it would be better to make a compressed cartridge out of grain powder.

1516. Do you know whether compressed powder cartridges have been tried in France for rifled breech-loaders?—I do not. I know that experiments have been carried out in France with compressed powder cartridges made by Dr. Doramus, and we have got the correspondence down at Woolwich; but I think they chiefly had reference to large guns. They were given up I think afterwards.

1517. You have made, I believe, many experiments to ascertain the velocities of shots fired from rifled breech-loaders?—Yes.

1518. It would be in that way that you could test the comparative shooting qualities of compressed and loose powder?—Certainly, as far as regards strength and uniformity; it is the best way you can do it, and in fact the only way, for when once a shot has left the muzzle of a gun the powder has nothing more to say to it.

1519. I suppose it would make no difference in making experiments what description of rifling you had?—No; provided you fired them side by side; that is to say, you would fire the loose powder out of the same description of rifle as the compressed powder.

1520. Do you know whether there are any Snider rifles chambered for compressed powder cartridges?—I do not know that.

1521. Do you know whether there are any breech-loaders chambered for compressed powder cartridges?—I do not.

1522. (*Earl Spencer.*) You do not know of any reason why, if compressed powder succeeds with one kind of bore and rifling, it should not succeed with another?—No.

1523. Have you tried compressed powder during a frost?—No.

1524. Do you see no reason why it should fail during frost more than at other times?—No, it might, but it is a matter for trial; I do not see why it should.

1525. We have heard that the cause of the failure in former years of compressed powder was the want of an air chamber, or perforation?—I do not know about small arms, but it was so when we tried it first with the 12-pounder breech-loading field guns without any perforation in the cartridge, that is to say, the charge was compressed in a solid mass, and then we found it was very bad indeed; it caused a considerable decrease in velocity and was not at all uniform. Then we made the cartridges with a number of perforations running through the charge, and we got uniformity back again better than with loose powder, showing the value of the perforations. To obtain uniformity I have no doubt that the whole secret is in the perforation, and in using *grain* gunpowder.

1526. Is it quite clear that it decreases the fouling?—I cannot speak positively upon that point. I do not think there is a sufficient amount of evidence to show, but as far as we went we found that if you did not make the charge too hard, there was no increase in the fouling.

1527. Do you think that a sufficient number of experiments have been made as to the amount of pressure that is best for shooting?—No, I do not think there have been a sufficient number of experiments made. I should like, before I went into any large manufacture of it, to make some more experiments, but I think that a little over two tons on the square inch was what we found to be the best.

1528. You would, I presume, also make experiments with regard to fouling and accuracy of shooting, and also the effect on the cartridge case?—Yes, I would first have experiments made for velocity. I would fire the cartridges side by side to see whether I got uniform and equal velocities; there would be no use in going on if you found at first that you did not get uniformity in velocity. Then afterwards, when you had fixed the proper amount of pressure, and you got uniform velocities, you might try for fouling and accuracy in shooting. As long as you get uniform velocities you will naturally get accuracy in shooting, provided the rifle be a good one.

1529. You do not think that the experiments which have been as yet made are quite conclusive?—No, I do not think we have done enough in the way of experiment to rush into any large manufacture without further trial.

1530. Has not the compressed powder been used in the blank cartridges which have been issued lately?—I believe it has.

1531. Do you know with what result?—I do not not know.

1532. In that way we should get practical experience with regard to the effects of rough usage, and I suppose fouling also?—I do not know. I do not think you could judge from the fouling of a blank cartridge what it would be with a bullet in front.

1533. I suppose you might argue that if you had less fouling with a blank cartridge made of compressed powder, you would also have less fouling if there was a bullet in front of it?—Yes, I think you might.

1534. (*Mr. Ross.*) 147 grains of powder seem a very large charge to use for testing the velocity?—They were proof cartridges, they were made for proving the gun.

1535. With so large a charge of powder as that there is a probability of a considerable quantity of it being driven out of the gun unexploded?—So there was probably.

1536. A smaller charge, say, of 70 grains, would be a better one with which to draw a comparison?—Yes, decidedly.

1537. (*Captain Mackinnon.*) Your opinion is that a perforation in compressed powder cartridges will cause complete and rapid combustion of the charge?—Yes, more complete and more rapid than with loose powder in long cartridges.

1538. And this, in your opinion, will tend to diminish fouling?—Yes.

1539. And it would also cause more uniformity?—It would.

1540. And it would give a higher initial velocity?—Yes, provided the powders were both the same, that is to say, if you take the same lot of powder and compress a portion of it, and put it into a cartridge and fire the same powder in a loose state, then I think the perforated and compressed charge will give you a higher initial velocity. It depends, however, on the amount of pressure applied.

1541. (*Captain Rawlins.*) Could you use powder of an inferior description for making compressed charges, or would you recommend that powder as good as the loose powder at present made should be used?—I should like to know what is meant by an inferior description of powder.

1542. The powder in the present day is very carefully manufactured, and goes through many processes to make it serviceable. Would it be necessary, do you think, to use that kind of powder?—No, I do not think so; for instance, I think you might use the ordinary fine grain powder.

1543. Would that be cheaper?—I think so.

1544. Have you seen any compressed powder cartridges without perforations in them fired?—Yes. I saw a rifle tried the other day, the Martini rifle. It fired I believe the compressed cartridge, and I found that it gave greater uniformity than any of the others in velocities.

1545. (*Mr. Ross.*) When did you try the Martini rifle?—The other day at Woolwich.

1546. (*Chairman.*) You have made experiments with the Martini rifle?—Yes, among all the others. I fired five rounds from each the other day.

1547. The Committee have found in making their experiments with that gun, that in consequence of the cartridges being badly made, there was a great escape of gas at the breech, and that, I should have supposed, would have interfered with the uniformity of the shooting?—There might have been a constant escape, but the velocity was uniform, although it was not quite so high as might have been expected. Five

Capt. W. H. Noble, R.A.

20 Feb. 1868.

rounds, however, are too small a number to judge from.

1548. Was it more uniform than with other guns?—Yes, as to velocity, but I take the velocity, say in the first 50 yards that a bullet has travelled, it may, although giving very fair velocity up to 50 yards, shoot very badly afterwards, after going 500 yards.

1549. In making comparative experiments with compressed powder and cartridges made up of loose powder, you would I suppose use the best description of powder for compressing and the best description of loose powder?—Yes.

1550. It does not follow, as a matter of course, that the best powder in a loose state is the best for compressing?—No; but in comparing the two, suppose you find that upon the whole the advantages are in favor of one powder for compressing, if you fire that powder in comparison with another powder for velocity, you must not imagine then that the compressed powder will give you—because it may or may not give you—the same velocity. There is the previous manufacture of those two powders to be taken into account, which may influence the result—they may be of different densities.

1551. Have you yet ascertained which is the best powder for compressed cartridges?—No; in our artillery experiments we have used Rifle L.G. powder, and in the small-arms experiments, I think, as well as I can remember, it was fine grain powder that was used—"J_3" powder.

1552. (*Mr. Ross.*) Have you tried any experiments at all for accuracy?—No, we never have, not with small arms; at least, not that I can remember. Of course I am alluding to perforated and compressed powder. Experiments were made for accuracy in 1860 with Mr. Browne's compressed powder without perforations. The shooting was very indifferent.

1553. (*Earl Spencer.*) Does compressed powder exert a different force on the bullet than loose powder?—I think probably that it does, the action of the perforated and compressed charge in some cartridges being more sudden.

1554. (*Chairman*). Therefore you could probably get expansion more easily in a solid bullet by using compressed powder?—I think so. I think it would "up-set" it better.

1555. The use of compressed powder might in fact affect the question of bullets with a cavity at the base and solid bullets?—It might.

1556. It would very likely make a solid bullet a better shooting bullet than one with a cavity at the base?—Yes, so far as up-setting it better than loose powder. All these questions are, however, proper subjects for experiment.

The witness withdrew.

Field-Marshal H.R.H. the Duke of Cambridge, K.G., G.C.B.

Field-Marshal H.R.H. the DUKE OF CAMBRIDGE, K.G., G.C.B., examined

1557. (*Chairman.*) Will your Royal Highness be good enough to state what you consider to be the requisites for a military arm, chiefly with regard to the necessity for a low trajectory and accuracy at long ranges?—Of course there can be no doubt of the advantages of those two points, which are very great, but at the same time you must bear in mind that the stronger the arm and the less complicated it is, the better it is for the soldier.

1558. If it were necessary, in order to ensure a low trajectory, to reduce the bore of the rifle, is there any military objection to a reduction of the bore?—I do not know that there would be any objection to a reduction of the bore; but I think it is a very grave question for consideration, whether the advantage you would gain by a low trajectory and improved shooting would not be counterbalanced by the expenditure you would have to incur if you altered all the arms in the country, and which you must do if you substituted a smaller bore for the one we have now.

1559. The Committee have been informed that it will be necessary in the course probably of the next autumn to provide the troops with new arms, and it would seem that if new arms are to be supplied it is desirable to have as perfect a one as possible?—That is a very grave and very difficult question. There is great force in the way in which you put the question, but I wish the Committee to understand this, that a change of that sort, if it is to affect the entire army distributed all over the world, will take a very long time to carry out, and it must be attended with the greatest inconvenience; for instance, take the question of ammunition in a time of war—nobody knows better than you do that a variety of bore or calibre for the infantry soldier is one of the most objectionable things you can have; it is so easy to make a mistake, and so difficult to correct it—and when men are supplied with a variety of ammunition for different arms. If you change the whole armament of the country it will be necessary to have two descriptions of projectiles for a very considerable period, not only at home but in India, where the present arm is now gradually being introduced by successive regiments as they go out, and also in the various colonies. The inconvenience resulting from such a change would be so great, that unless you are sure to gain largely by the arm you intend to substitute for the one in possession, I think it is better, if possible, to retain the arm in possession. Provided always, that you are satisfied you have got as good and probably a better weapon than any other army possesses that you are likely to meet.

1560. (*Earl Spencer.*) Besides a low trajectory, which you would no doubt consider an important thing, there would be other considerations, such as wear and tear of the barrel in a military arm?—No doubt, I quite admit that.

1561. (*Chairman.*) I will lay before you, sir, a comparative statement as to the height of the trajectory from the small bore ·451, and from the 5-groove rifle at present in the service?—There is no doubt that the small-bore has great advantages with respect to that specific point, and the question for the Committee to consider, in my opinion, is, whether the advantage to be gained by this will be so great relatively to the disadvantage which will be inevitable from an entire change of the arm, that the country ought to be called upon to make the change.

1562. (*Earl Spencer.*) It would be a change very similar to that which is now going on as to muzzle-loaders and breech-loaders?—Yes, but that we could not avoid. We were obliged to make some change, because every other army in Europe adopted the breech-loader—it was inevitable,—and, moreover, you were able to make that conversion very rapidly with the arms in possession, which you could not have done if you had taken a new arm from the first. At the present time, I believe, we have arms for all, or nearly all, the infantry in Europe. We have arms both at home and in India, and a reserve besides, and therefore to that extent we are now ready to take the field in Europe with ammunition and arms of one calibre.

1563. How long did it take to effect the change required from the muzzle-loader to the breech-loader for the force you have mentioned?—The whole change has been made in a year and a half up to the present time.

1564. (*Chairman.*) And I presume that any other change might be as quickly made?—No; because the time required for the conversion of an arm is very slight, as compared with the time that would be consumed in making an entirely new arm. That would take much longer and be much more expensive.

1565. It was stated in evidence by Colonel Manly Dixon that of nine competitive arms, the most expensive and the one which would necessitate the greatest change in the machinery would not lead to an expenditure of more than 6,000*l.* to alter the machinery?—As far as that goes, that is a very small amount, but

Field-Marshal H.R.H. the Duke of Cambridge, K.G., G.C.B.

20 Feb. 1868.

then comes the military question which I have already pointed out, the great inconvenience that would arise from having a double set of arms and a double set of ammunition—and the ammunition is the special point—for a very considerable period, which of course could be calculated; and it would depend upon how rapidly a new arm to be substituted for the present arm could be introduced, both in a financial and in a manufacturing point of view; that is to say, how long they would be at Enfield and other establishments in supplying new arms of the description intended, and how great would be the cost, which of course would be spread over a certain number of years, and during the whole of which period we should have, as I have said, a double set of arms and a double set of ammunition.

1566. Supposing that all other objections were put aside, and that the shooting was equally good from a shorter rifle than the present one, is there any objection to a shorter rifle being used?—The present rifle has been shortened lately several inches; I mean the old Enfield rifle has been shortened several inches, and I do not think that the soldier ought to have a shorter arm than that is. You must have a certain length for the arme-blanche; you must put on a sword or a sword-bayonet, which has its disadvantages for an ordinary regiment of the line; it does not affect a rifle corps; but we consider that the arme-blanche is most important, and a matter for much consideration.

1567. Will not the advantage be very much on the side of the firearms now that men can load so quickly as to be able to fire 12 shots a minute, so that it will hardly ever occur that two lines opposed to each other will close with the bayonet?—I should think it would be much less so than formerly, but still I am of opinion that you must always keep the army relatively to other nations in a position to do what it may be called upon to do. I have a paper here containing some remarks of the late Duke of Wellington. They do not seem to apply so much to the arm at present in use, but refer rather to the state of things when a smooth-bore gun was used at very short ranges, and when the object seemed to be to get a very crushing smooth-bore arm compared with one which would have much less effect. In those days it was considered that a ball discharged from a large bore had a more crushing effect than when fired from the smaller arm that was then in use by the French and other continental armies. It does not seem to apply to the arms of the present day; the circumstances are entirely different. The projectile which in fact is now universally fired from a rifle cannot be put on a footing with the bullet fired from a smooth-bore gun at very short ranges, and which has very much less crushing effect than the smallest projectile fired from a rifled gun.

1568. An erroneous idea seems to be entertained by some persons that because a bullet is fired from a small bore corresponding with that cartridge (*producing the same*) it will only make a hole of that size, whereas when it strikes it turns round and will force its way laterally?—That is to say it flattens.

1569. Yes, and it turns round?—It has no doubt great crushing power.

1570. (*Earl Spencer.*) I suppose, sir, you attribute considerable importance to penetration in the use of a military arm?—Yes, that is a very important point.

1571. It is probable, I think, that penetration and crushing effect are sometimes confounded, and what is wanted is a bullet that will stop a horse or a man, and not go merely through him and wound him very slightly?—Yes. The opinion of the Duke of Wellington had especial reference to animals, and the effect of a ball fired from a larger bore on the bones of animals, which of course would be much greater from a rifle than from a smooth-bore.

1572. Your Royal Highness is aware that a heavy charge of powder and a light bullet have very much the effect of making a large wound?—Yes; but my observations really have much more reference to the military question, to the double ammunition, and the time that it must take to make a complete change in the armament.

1573. You would probably not see any objection to two sorts of ammunition that would be interchangeable; for instance, a heavy charge of powder and a light bullet for the men generally, which would give a very low trajectory up to 500 yards, and a heavier bullet with perhaps a lighter charge of powder, that would give great accuracy at longer ranges?—I should not object to that at all. I object to nothing which is interchangeable; that is to say, supposing there was a mistake made, that the arm could still be used.

1574. But you would object to different bores?—Yes, I should, and for this reason: take the Snider and take the Chassepôt, of course the ammunition for the Chassepôt could not be made to fit the bore of the Snider, neither would the ammunition of the Snider fit the bore of the Chassepôt. The present arrangement is that the same bore is adapted for our carbines and our rifles, and the carbines both for cavalry and artillery, so that the same bore will do for cavalry, infantry, and artillery, and the same ammunition.

1575. (*Chairman.*) Evidence has been given before the Committee as to the use of explosive shells in India. Do you think that they would be applicable for general service?—I should think so, and be valuable too.

1576. Would they not have a very great moral effect upon the troops against whom they were used?—No doubt.

1577. It appears from the evidence we have received that the ammunition made up in the form of shells is exactly similar in all its shooting qualities to the ammunition made up in the ordinary way?—Just so.

1578. (*Earl Spencer.*) Has your Royal Highness seen the reports made on the Whitworth rifle muzzle loaders which were issued to the troops, and if so, will you be good enough to state whether they were upon the whole favourable or otherwise?—I think they were favourable, but I have not gone so minutely into that matter as to be able to give a very decided opinion one way or the other.

1579. With regard to the two kinds of cartridges, the metallic cartridge and the paper cartridge, has your Royal Highness formed any decided opinion in favour of one or the other?—I could not give any decided opinion upon that.

1580. Would it be of great practical importance that soldiers should be able to make up their own ammunition?—Yes, of immense importance, if it could be done, for they might be frequently in a position in which it would be most important to do so, when if they could not they would be in great straits and difficulties.

1581. Practically, is ammunition often made up by soldiers?—Yes, constantly.

1582. There would be some difficulty, I suppose, with the present Snider ammunition?—No doubt, and there would generally be with all breech-loading ammunition. If it could be done, there would no doubt be great advantage in it.

1583. There might possibly be other disadvantages to counterbalance it, such as the effects of wear and tear, rough usage, exposure to damp, and things of that sort?—Certainly there would be.

1584. (*Chairman.*) Most of the paper cartridges that the Committee have seen might be very well carried packed in a pouch, but they could not be safely crammed into the men's trowsers pockets?—Quite so, and that is a great disadvantage. There is no question about this, that the usage of arms by the soldier, do what you will, is always very much rougher than anybody can imagine, more particularly on board ship. There they get knocked about much more than people would suppose.

1585. (*Earl Spencer.*) Would not a stronger barrel than the one at present in use be of some advantage?—Yes; the barrel of the present arm is somewhat weak.

Field-Marshal H.R.H. the Duke of Cambridge, K.G., G.C.B.

20 Feb. 1868.

1586. Has your Royal Highness formed any decided opinion as to the particular form of a bullet, whether it should have a solid head, or a hollow head like the present one?—I think that that is a mere matter for experiment in shooting; it depends entirely upon the results of the practice. Whichever bullet produced the best results in practice would be the one I should prefer.

1587. (*Chairman.*) The bullet with a hollow head at present used in the service would make a much worse wound than a solid bullet, but it fails in penetration; for example, it would not penetrate a fascine or a gabion?—Then it would be very objectionable. I should consider that a great defect.

1588. It is important, I presume, that a bullet should penetrate fascines, gabions, and mantlets?—Yes; what I meant was, that any bullet that would meet the requirements of the service, be it one or the other, would be equally acceptable in a military point of view; and of course the one which would be wanted would be that which, on experiment, practice, and trial, produced the military results most required, and amongst those certainly penetration is one of the first.

War Office, Tuesday, 3rd March 1868.

PRESENT:

LIEUT.-COLONEL FLETCHER IN THE CHAIR.

CAPTAIN RAWLINS.
CAPTAIN MACKINNON.
EARL SPENCER, K.G.
CAPTAIN HAIG, Secretary.

F. A. Abel, Esq.

3 March 1868.

FREDERICK AUGUSTUS ABEL, Esq., examined.

1589. (*Chairman.*) Will you state to the Committee what position you hold?—I hold the position of Chemist to the War Department, my head quarters being at the Royal Arsenal.

1590. Have you made many experiments with regard to the best lubrication to be used for rifle cartridges?—I have; the subject has received a good deal of attention on my part for some years past, indeed ever since 1856, when the question as to an improvement in the lubrication was first raised. A committee was appointed in 1857 to report upon the proposal made by Colonel Boxer at that time to substitute pure beeswax for a mixture of beeswax and tallow as a lubrication for small arms. A great number of experiments were in consequence made, not only by the committee, but by myself individually, to ascertain, in the first instance, whether beeswax would act as efficiently, as a lubricant, as any mixture of beeswax with a softer material; and, secondly, whether certain defects which were inherent in other lubricants would be remedied by the use of beeswax alone. The result of those experiments proved incontestably that beeswax acted efficiently as a lubricant, and indeed more so than mixtures of various substances, either with or without beeswax; it possessed a lubricating property which acted differently from those of other substances, and it had the great advantage of perfect permanence in its properties and perfect stability; that is to say, the influences of heat, or atmospheric influences generally, the influences of moisture, and the effects of time, produced little or no change in the beeswax, if at the beginning a material of the best quality was employed.

1591. You have stated that the committee sat in 1857?—Yes.

1592. Therefore the lubrication which they had to consider was with reference to muzzle-loading rifles?—Yes, it referred to the converted Enfield rifles.

1593. With regard to the lubricating properties of beeswax, do you consider that they are better than would be obtained by any mixture with any softer material?—I consider that they are, because the beeswax acts quite differently as a lubricant from any fatty materials. The action of the wax in the barrel is similar to a burnishing action, and as the wax is carried along the surface of the barrel it glazes it; it does not merely smear it over with some soft matter, which might partly prevent the adhesion of fouling, as when a fat is employed, but it glazes the barrel so perfectly that it produces a surface to which any fouling material or leading has very little if any tendency to adhere. Therefore I consider that it has a more perfect action as a lubrication, although it is a very different action to that possessed by any other lubricant.

1594. Do you think that the same observation would apply in all climates?—Yes, pretty equally in all climates, but, naturally, in the first round or two in cold climates it will always be somewhat deficient in its action, because first of all the barrel is very cold, and the wax is hard, and therefore it would have a tendency to be brittle in very cold climates, but that would soon correct itself.

1595. Would not the wax act better in hot climates than in cold?—No; I think that in very hot climates it would not act as well as in very cold climates, that is to say, the heat of the barrel would be proportionately so much greater, consequently there would be so much less deposit of wax upon the barrel, and the fouling would be drier in hot climates than in cold.

1596. Have you tried oil as a lubricant?—Not purely oil, and for the obvious reason that it is extremely difficult of application, unless you had some complete metallic envelope, something like, on a small scale, the metal case used for holding the mixture of oil and tallow which is employed for the Armstrong guns. I think, unless you had some arrangement of that description, you could not use a liquid, or anything approaching it, but I have tried oils in small quantities in admixture both with beeswax and with fats of different kinds.

1597. With regard to the lubricating quality of the wax, does it not depend in a great measure upon the proportion in which it is put on the bullet, that is to say, if too much is put on the bullet it would have an injurious effect?—It might so, but in the case of muzzle-loading small arms that difficulty was counteracted by the fact that any excess of beeswax is removed during the entering of the bullet, which would not be the case in breech-loading arms. An excess of lubricant would act prejudicially, whether it were beeswax or any other.

1598. Are you acquainted with Price's composition?—Yes; it was first of all communicated to me in confidence, when it was proposed as a material for a lubricant for the Westley Richards' arms; my opinion was not asked upon it at that time, and it was adopted without any question as to its quality. Mr. Westley Richards said that it was necessary to use it, and it was used. I was subsequently asked for a report on the

material, especially with reference to its powers of resisting climatic influences, and its effect upon the metal, and my examination of it showed that undoubtedly the material is no better, but perhaps worse, than many other lubricating mixtures with which I was acquainted.

1599. In what respect does it fail?—It gradually changes and hardens, it contains a quantity of castor oil and palm oil, which in the course of time exude or separate from the material; it also contains resin and lead soap, both of which are hard substances and not possessed of great lubricating properties; these are gradually developed in their purer condition by the absorption of the oils into the paper, and so the lubrication must become depreciated in course of time.

1600. What effect has tallow or a lubrication like tallow upon the bullet?—The action of any fatty material upon the bullet is to promote a gradual oxidation, and to produce upon the bullet a crust, which in fact is white lead, or rather a mixture of white lead with the fatty acid that is produced from the fat which is used. The reason of this is, that all these fats, although you may use them in a perfectly pure condition at first, undergo a change by exposure to air, and especially in thin films, which results in a development of acid. Then this acid matter establishes a corrosive action on the lead, and eventually the lubrication may be entirely destroyed and converted into a hard material containing lead in its composition. On the one hand the bullet is corroded, and on the other hand the lubrication is destroyed.

1601. Corrosion I suppose would take place more in some climates than in others?—Yes, it would take place more rapidly in warm damp climates than in dry climates.

1602. In India, for instance, how soon do you think it would have a deteriorating effect on the bullet?—It is very difficult to fix the precise period, but in 1857 I examined some ammunition which had been returned after, comparatively speaking, a very short time; and in that instance the corrosion had proceeded to a very considerable extent, although the lubrication at that time consisted of only one part of tallow mixed with five parts of beeswax.

1603. (*Earl Spencer.*) Have you made any experiments with bullets composed partly of tin?—I have not tried any firing experiments with them, but the question was referred to me when, as I understood, Mr. Lancaster proposed to use an admixture of tin and lead for the purpose of hardening the bullets. The effect no doubt would be that of hardening the bullet, and if that were a result beneficial to firing it would be produced in that way. Hitherto the object of all our aims has been to obtain lead as soft as possible. Lead is selected and inspected with extreme care, especially with reference to its softness, so that it contains no metal such as tin, or arsenic, or antimony, that would impart anything like hardness to it.

1604. Do you think that a mixture of tin with lead would prevent the corrosion you have spoken of?—I do not think it would have any important effect in preventing it, it might slightly retard it, but unless the proportion of tin were considerable it would not be likely to have a very useful effect in that direction.

1605. Have you seen the metallic wad that Mr. Whitworth uses in his cartridges?—I have not seen any of the recent wads, but I think I have some idea as to the general construction of the wad you speak of.

1606. Could you apply oil if that form of wad was used as a lubricant?—I do not think that in any instance you could use oil with confidence in an arrangement of that kind unless the oil were to be perfectly enclosed, so as to be perfectly sure that it would not gradually exude and be absorbed by the wrappers or portions of the cartridge which would convey it to the metal. A freshly prepared wad of that kind no doubt acts very efficiently, but I doubt whether it would prove to be so in the long run.

1607. You could not use pure beeswax with that form of wad?—Not readily.

1608. Do you believe it would act as efficiently as a lubricator, putting aside the question of keeping, as when the bullet is covered with a lubricant?—I am hardly prepared to give an opinion upon that; the position of the lubricant is different, and that may make a very considerable difference in the shooting. The true principle seems to be to have the lubrication around the bullet, that is to say, upon that portion of the arrangement which comes into closest contact with the barrel.

1609. The object of the lubrication being to prevent leading and fouling from the powder?—Yes, the fouling from the powder being I believe in very many instances set up by the very slightest tendency to leading in the first instance.

1610. I suppose it would be not easy to say which is the most difficult thing to prevent, the fouling from the powder or the fouling from the lead?—It would be very difficult to say.

1611. (*Captain Rawlins.*) I suppose there would be no difficulty in getting the best beeswax?—None whatever.

1612. Do you think that the lubrication would be more liable to deteriorate when put on in cannelures or on paper?—In the case of beeswax it would hardly make any difference; the alteration which the beeswax undergoes is so very slight that, after the experience of many years of its application on paper, it has not been found to undergo any change. If anything, it would be more protected in the cannelures, because it would not be spread over so large a surface.

1613. Would the use of any other lubricant than beeswax on the paper, not in immediate contact with the bullet, be objectionable?—It would be in this way, that however carefully a soft lubricator may be applied, containing any fatty matter in the first instance, the tendency of the paper is gradually to draw the latter forward towards the bullet. In the case of that apparently hard mixture which has been referred to as Price's mixture, the lubricant was applied very carefully to a given length of the cartridge, but after exposure for about a week to a temperature not exceeding 80° F. during the day, and 60° F. during the night, the fatty portions had been gradually drawn into the paper towards the bullet, and absorbed by the wrappers.

1614. Then it was in contact?—Then of course the oils were brought into contact with the metal, and the lubricant was no longer in its original condition.

1615. (*Chairman.*) Referring to what you stated about soft lead being chosen for bullets, will you be kind enough to explain why that is preferred?—I should imagine the reasons to be two. One reason, and no doubt a very important one, is that of facility of manufacture. As the bullets have to be manufactured by pressure, a slight difference in hardness makes a great difference in the working of the machines and the duration of the dies. Secondly, also, as long as the bullet is hard enough to resist anything like mechanical injury from rough usage, the softer the metal the more likely is it to act efficiently in expanding into the grooves of the rifle.

1616. Do you think it is possible that the lubrication which is placed on the bullet should, when the rifle is fired, extend to the end of the barrel, or that it would be completely absorbed in the first half or two-thirds of the barrel?—I should consider it hardly likely to take place with such an amount of lubrication as I know now is used in the breech-loading rifles; it might with a very small quantity, but it would not be of very long duration, that is to say, if the firing was kept up with moderate rapidity, the lubrication, however small in quantity, would gradually be carried on towards the end of the barrel, because the quantity deposited upon the surface is very small indeed, it is a mere glazing upon the surface of the barrel.

1617. (*Earl Spencer.*) With bullets lubricated partly with tallow do you think it is possible that that would take place?—I do not think it would make any considerable difference.

1618. I suppose the effect of corroded bullets would be that it would be almost impossible to load, and it

F. A. Abel, Esq.

3 March 1868.

would deteriorate the ammunition very materially in store?—There would be a difficulty in loading, undoubtedly; but, especially with bullets that were made with such accuracy as the bullets now made for breech-loading arms, there would also be a difference in the form of the bullet resulting from the corrosion, which might considerably affect the shooting.

1619. (*Captain Mackinnon.*) Would bullets made of very soft lead be more likely to cause lead fouling than bullets that had been slightly hardened?—There might be a slight tendency in that direction.

1620. (*Captain Rawlins.*) Would very soft lead injure the dies more than lead which was slightly hardened?—No; the softer the metal the better for working purposes.

1621. (*Chairman.*) Have you made any experiments with compressed powder for small arms?—Not specially for small arms, but the subject generally has received my attention for some years past, as a member of the committee on gunpowder, which has been recently dissolved. I believe that the production of compressed powder in the form of small pellets with perforations emanated with that committee, that is to say, with one of its members, Colonel Boxer, who proposed, in 1861, a trial of that particular form of compressed powder as a material for cannon cartridges.

1622. Will you be good enough to state generally the advantages, and, if any, the disadvantages of compressed powder?—I should consider that compressed powder (that is, speaking now of powder either converted directly from meal powder to compressed powder, or powder similarly converted from grains into a compressed form), would have several advantages; thus, for example, the powder in the first instance would have less tendency to change in the course of time by travelling, or from atmospheric causes. If gunpowder is converted into compact masses it has no tendency to break up, or little tendency to dust, and less tendency to absorb moisture. Under certain conditions, that is, applied in a proper way, undoubtedly compressed powder affords a better means of ensuring the perfect action of the powder upon a projectile, that is to say, you may more readily establish different degrees of rapidity at the first inflammation of the charge by compressing it; you may utilise the consolidation of the charge as a means of presenting definite surfaces for the first inflammation of the cartridge, as by the perforation, for example, which has been adopted by Colonel Boxer in his cartridge lately. You there present a certain definite surface of the cartridge to rapid inflammation; you ignite the charge more uniformly, and you are more likely to establish perfect action than by using the grain powder.

1623. Supposing that a large number of such cartridges were made, do you think you would get uniform action throughout the whole?—You would if you were careful as to the selection of the powder you used. The cartridge would probably be more delicate in its action with compressed powder, and it would be more necessary to select with great care the powder with special reference to uniformity; but, supposing that to be secured, I believe that the uniformity of firing would be greater with compressed powder than with ordinary powder.

1624. Do you think there would be a difficulty in the manufacture of cartridges for small arms with compressed powder?—I should say none at all.

1625. Would there be no difficulty in getting equal compression throughout the cartridge?—There is a little difficulty in that direction, but that would be uniform in all the cartridges. Some experiments which I have recently made have shown that the small perforated pellets which have been prepared for cannon-charges have slightly different densities in different parts, and that difference in density influences decidedly the degrees of rapidity with which the different parts of the charge inflame, but that would be uniform in all the cartridges, given a proper machine by which to manufacture them. Therefore if you once establish that a cartridge has given good results, whether it be uniform throughout or not, is a matter of minor importance, as you would obtain the same result in all instances.

1626. With regard to the comparative strength of compressed powder and ordinary powder, have you formed any opinion?—It is very difficult to give a decided opinion upon that without making a very considerable number of experiments, which I think have not yet been sufficiently extended, that is to say, comparative experiments as to velocity, precision, and fouling in the arms. I think, with regard to small arms, the subject has hardly been sufficiently developed to warrant a decided opinion upon this point.

1627. Have you made any experiments, apart from firing, as to the strength of compressed powder, and its liability to foul or not?—No, not apart from firing; those are the only experiments by which that point could be satisfactorily settled.

1628. Have you any data upon which you can form an opinion as to whether compressed powder is more or less liable to foul than other powder?—I have no absolute data, but speaking simply from my knowledge as to the action of powder when used in different forms in arms, I should say that, if anything, the tendency with compressed powder is to foul less, because you establish a more perfect burning of the powder, and I should also imagine that, in consequence of this, the strength of the powder would be greater than in the granulated form.

1629. Have you formed any opinion as to other materials besides powder, and as to their capability of being used for small arms?—I have turned a good deal of my attention to this subject, especially with reference to the application of guncotton, which, if any material be likely to become an efficient substitute for powder, is, I think, the one to be looked to. I have been carrying on preliminary experiments on the construction of a gun-cotton cartridge for the Snider breech-loading arms, and although the progress made is slow, partly from unavoidable circumstances, and partly from the great delicacy and nicety with which this explosive material acts, as compared with a comparatively crude substance like powder, I still consider there is a promise of our being able to use gun-cotton as the explosive agent for breech-loading arms.

1630. If gun-cotton could be used, there would be no fouling?—None.

1631. Have you formed any opinion as to what description of powder is the best to compress for rifle cartridges?—No, that is entirely a question of experiment. I have not actually gone into the question of the manufacture of compressed powder for small arms.

1632. (*Earl Spencer.*) You have stated that it would be very necessary to make a careful selection of the powder in making up compressed powder cartridges, in order to get uniformity of shooting, but I suppose that the same care is necessary now?—Yes, probably it might be found that somewhat greater care still might be necessary, but it would present no difficulty at all.

1633. I suppose that the action of the bullet would be somewhat different?—I believe it would be, but it is very difficult to speculate upon that; I believe that the action upon the bullet at first would be more rapid, the ignition of the charge extending over a greater surface within a given period, and the first expansion of the bullet would therefore be more perfect with a compressed charge than with a charge of granulated powder.

1634. I suppose there would be some difficulty in carrying on experiments with compressed powder, if you wanted to diminish or increase the charges without having to send the cartridges back to be pressed again?—There certainly would; it would be necessary in that case to prepare charges beforehand of different lengths and weights.

1635. You could not easily diminish the charge?—Not accurately, and not without a tendency to break up the charge and introduce inaccuracies.

1636. The Austrians I believe tried many experi-

ments with guncotton which were not successful?—Yes, they tried a great many experiments some years ago, but the committee which was appointed to investigate the guncotton question examined those experiments carefully, and the conclusion arrived at was that the subject had not been attacked in the right direction, and that it was not surprising that no permanently good result was attained.

1637. The experiments on guncotton are not so far advanced at the present moment that you would recommend the Committee to hold their hand as to that?—Certainly not.

1638. Would you make the same remark as to compressed powder?—I think that the question of the value of compressed powder could be settled within a very short period. I fancy that the data which already exist have shown precisely the right direction in which to make experiments, and I think that a short course of experiments would establish either one way or the other the advisability or not of using compressed powder.

1639. Do you think that there would be any difficulty in getting it made, supposing that you were obliged to go beyond the arsenal?—No, it is merely a question of an alteration of machinery for the manufacture of charges in that form instead of in the ordinary form.

1640. (*Captain Mackinnon.*) Could not the pellets be waterproofed with collodion?—No; I do not think that any arrangement for applying waterproofing material actually to the surface of the powder would be found permanently efficient. The use of collodion was proposed by the person who first developed the idea of compressing the powder, by bringing the grains into very close contact. Dr. Doremus, an American, proposed the use of compressed powder for cannon, and he suggested that the powder should be coated with a film of collodion. He had the idea that a coating of collodion produced additional compression of the powder, but that was perfectly erroneous. There is no question that a thin coating or film would be liable to mechanical injury, and it would not be durable for a sufficient length of time to rely upon it with confidence.

1641. Do not compressed powder pellets give a much more sudden and severe blow than loose powder?—Yes, at first.

1642. Then a bullet made of soft lead would be differently acted upon by compressed powder than by loose powder?—I should say so, to some extent.

1643. Probably that would make it necessary to give the bullet a different shape?—It might, but it is very difficult to say; it might show possibly a slight difference in favor of a somewhat hardened metal.

1644. (*Captain Rawlins.*) Is there tendency to caking in the present service cartridge powder?—Only a very slight tendency. The present service cartridge for breech-loading arms is so thoroughly waterproofed that even when exposed to very severe tests in the way of keeping in a humid atmosphere, it exhibits very little if any tendency to cake. I have some cartridges which have been for three months kept in an atmosphere saturated with moisture, and I have reported upon them, I believe, once or twice to this Committee. I have recently examined some of those cartridges and the powder is to all intents and purposes unchanged. There is hardly any tendency to cake in the slightest degree.

1645. There would be none, of course, in compressed powder?—No, because it would already be in one solid mass.

1646. Would the compressed powder be applicable for paper cartridges?—I should think so. I do not see that there would be any great difficulty in applying it to paper cartridges.

1647. Would the sides of the perforation which runs up the centre be liable to crumble in and fill it up?—No, not if properly manufactured, with such an amount of pressure as would be necessary to consolidate the powder properly.

1648. I am speaking of paper cartridges?—I do not think it would affect the stability of the charge. What I have said is generally with reference to the tendency of the powder to break up.

1649. Might not a cheaper powder be used which was perhaps not quite so highly worked up?—The finishing processes might not have to be applied to the same extent to powder of that kind. On the other hand, the process of conversion into a condensed form might be a little more expensive than the old method of making cartridges, therefore, probably these differences might counterbalance each other in the course of time.

1650. In a case of emergency, supposing that soldiers had fired away all their ammunition, do you think that some machine might be carried with a regiment, a press, or something of that kind, to enable them to refill the cases if they had the loose powder?—I do not think that that could be efficiently done.

1651. You do not think that a sufficient quantity of powder could be pressed into a case?—No, I think not; certainly not with sufficient uniformity.

1652. (*Chairman.*) How is the waterproofing of the present service cartridge secured?—The metal coil is closed with india-rubber cement at the overlapping, and the entire case is covered with a paper coating attached to the metal by means of varnish, which thoroughly waterproofs the paper. The case is firmly choked round the bullet, and some beeswax is applied there as a cement.

1653. The cartridge itself is almost waterproofed without the paper, is it not?—Yes, but there is a very slight tendency to the creeping in of moisture if the paper is not superposed, or unless some cement is applied to the place where the coil ceases.

1654. As in Daw's cartridge?—That is soldered, I believe. I consider that the other offers greater certainty and security, from the fact of its consisting of a coil, cemented where the overlapping ends, and coated with waterproof paper. The perfection of soldering depends entirely upon skilful workmanship; you may have here and there a little pin hole which may considerably affect the tendency of the cartridge to absorb moisture, but if you have a double case of metal and varnished paper, if there were any defect of that description in the metal, it would be closed up by the waterproof paper.

1655. Have you any idea as to how compressed powder would affect hardened bullets?—No, I have not; in fact, one could not give an opinion upon that except after actual trial.

1656. (*Earl Spencer.*) It was stated by one witness who had seen some former trials made with compressed powder that it was affected by frost. Do you think that is likely?—I do not see how frost is likely to affect it more than it would affect the ordinary shooting. In very severe cold, if exposed to it, there might be a little tendency of the pellets to crack, but I should think it would be an extremely rare occurrence indeed.

1657. (*Chairman.*) Have you formed any opinion as to what state of the atmosphere causes powder to foul?—I can hardly give an opinion upon that; it is a point upon which a man who is constantly firing under all circumstances would be more capable of giving a decided opinion. From my own observation, however, I should say that a hot dry day is the day on which of all others the greatest amount of fouling would be produced.

1658. (*Earl Spencer.*) Some evidence has been given with regard to detonating powder, and it has been stated that it is very difficult to get uniform qualities, that some of it is very much more sensitive than others?—I think it should not be the case with a proper system of manufacture. The detonating material which is used in the caps is capable of quite as uniform manufacture as gunpowder, there should be no variation in it.

1659. Do you believe that it is so in practice?—I think that its uniformity of action would rather depend upon the manner in which it is placed in the cap, and upon the uniformity of its compression in the cap. It may make a very considerable difference if the powder is less compact in the cap in one case than

F. A. Abel, Esq.

3 March 1868.

in another, and the strength of the flame produced from it will be very different.

1660. That is to say, it would require in one case a lighter blow to explode it?—Yes, a lighter blow in one instance than in the other. The more tightly the material is pressed the smaller the blow required to explode it, and the stronger the flash will be.

1661. Lately I believe that some alterations have been made in the anvils in consequence of the difference that has been found?—I believe so, but I am not acquainted with the details of the alterations.

1662. Would you believe it possible that a cap could be exploded without the piston actually entering the chamber, by a blow from the outside?—Not unless there was some support on the other side to where the blow is applied.

1663. You have probably seen the bolt principle which is used in breech-loaders?—Yes, I have seen it.

1664. Do you think it possible for the bolt, without the piston protruding, to strike against the base of the cartridge and explode it?—I think not, with the detonating compositions which are used.

1665. (*Captain Mackinnon.*) We have had copper-rimmed cartridges in use, some of which were made in America and some in England. As a rule, the American copper was good and the cartridges stood well, but the cartridges made in England generally burst, and that I suppose was due to the bad quality of the copper?—It may have been due to a bad selection of copper; sheets of that metal vary very much in quality.

1666. What is the difficulty in getting it?—There is none in obtaining good metal, if a careful selection is made.

1667. I have been informed that notwithstanding that great care was taken in the selection of the copper, it was found most difficult to get copper of a good quality?—It is more difficult to get a good quality of copper sheet than to get a good quality of brass sheet. Copper sheet is more likely to vary and requires more careful selection. Copper, generally speaking, is of considerably higher quality in America than that which is ordinarily used here, and it requires great care in selection and inspection to secure a good quality.

1668. Does that depend upon the process of manufacturing the copper from the ore?—Yes; it depends mainly upon the condition and purity of the copper when it is converted into sheet.

1669. Would not the fact of there being this difficulty in getting copper of good quality be against the use of copper in the manufacture of cartridges if they were required to be made in large quantities to immediate order?—I should hardly think so. I consider that there would be no difficulty in obtaining sheet copper of proper quality by submitting supplies to careful inspection.

1670. Cartridge makers who have been making copper cartridges for competition, and whose interest it was therefore to make the best cartridges, have not succeeded?—That might depend upon the fact that the subject was new to them, and that they had not applied sufficient means for determining its quality. They may have been obliged to rely entirely upon those who supplied them with it; but I do not think there would be any difficulty in obtaining sheet copper, which would be as satisfactory as that which is used in America.

1671. (*Chairman.*) I suppose that brass would be more easily obtainable in England than copper?—It is not more easily obtainable, but the manufacture of that particular form of brass which is used for cartridges has attained a greater state of uniformity, and it is not so readily affected by slight differences in the quality of the copper used as would be the case if copper alone were employed. Brass being an alloy of copper with zinc, and the fact of the former metal receiving other properties by this alloying, does away to a certain extent with the influence of the impurities originally existing in the metal.

1670. Which is the cheaper of the two?—Brass would be the cheaper of the two.

The witness withdrew.

APPENDIX II.

EXTRACTS FROM VARIOUS REPORTS OF ORDNANCE SELECT COMMITTEE ON SYSTEMS OF RIFLING FOR SMALL ARMS, &c.

Report No. 2578, 26/11/62, of the Ordnance Select Committee, of which Br. Genl. St. George, C.B., R.A., was President.

* A trial between small and large bore rifles.

Par. 46. "Although it has been considered advisable for the sake of arriving at a fair and impartial comparison to make this* trial, the Committee would observe with respect to it, that no conclusion could have been expected other than what the results have shown, viz., the superior range and precision of the small bore rifles.

They think, therefore, in this instance, it will be sufficient to show the several figures obtained from the competing arms, observing only that the service powder was used with the large bores, while with the small bores, that powder was employed which experience has proved to be the best adapted to a small calibre, viz., Curtis and Harvey's No. 6."

TABLE 2.

Range.	300 Yards.	500 Yards.	800 Yards.	1,000 Yards.	1,200 Yards.
	Inches.	Inches.	Inches.	Inches.	Inches.
Whitworth - -	3·89	7·39	17·18	26·54	49·69
Enfield. D. - -	10.20	17·04	28·96	43·66	81·10
Lancaster - -	10·06	17·58	28·35	43·61	65·09

Par. 60. "The Committee are of opinion that as the present system of musketry instruction is calculated to produce ere long a very high standard of shooting throughout the army, the introduction of a weapon of great precision at long ranges would materially increase the general efficiency of the infantry, and place it in a better position to keep down the fire of the rifled artillery of the present day."

Report No. 3617, Minute 14,285, date 1/2/65, of th Ordnance Select Com mittee, of which Br. Genera Lefroy, R.A was Presi dent.

Par. 2. "Admitting that the calibre, ·577 inch of the present service Enfield is a fair medium gauge for a muzzle-loading arm, when the utmost regard must be had to freedom from fouling, the Committee think that the bore of a breech-loading arm may be considerably reduced without sacrificing this important condition, and looking to the very satisfactory results with Westley Richards' breech-loading rifles in 1864, they are of opinion that a calibre of ·450 inch may be safely adopted for the new arm."

Report No. 3654, Minute 14,730, date 14/3/65, of the Ordnance Select Committee of which Br. Genera Lefroy, R.A was Presi dent.

Par. 12. "The Committee have now respectfully to submit their observations on the whole question. The ultimate armament of the Infantry with breech-loading weapons, is determined upon. It would be done at a comparatively small cost by conversion, but it is now well known that the calibre, twist, and form of rifling of the Enfield is not the most favourable to fine shooting, and it is quite certain that no converted arms can possess the precision which will be easily attained in a new breech-loader of smaller gauge and quicker twist. Nor will the soldier be able to carry that increased quantity of ammunition which is so desirable without a reduction of calibre."

War Office advertisement to gunmakers and others, 21/6/65, signed by Maj. Genera J. St. George Director of Ordnance.

Par. 2. "The principal elements of the new breech-loading rifle, and the conditions on which persons will be allowed to compete, are as follows:

"1 Calibre, ·450 inches."

APPENDIX III.

LIST OF REJECTED ARMS AND CAUSES OF REJECTION.

Adams, ·577 inch.

In the damaged cartridge trial the breech block of this rifle was blown open, and the cartridge case blown out to the rear.

Amsler-Milbank, ·45 inch.

In this rifle the cartridge can be placed in front of the extractor.

Berdan, ·45 inch.

(1.) With spiral Spring Lock.

The breech block of this rifle was not properly secured to the barrel, which prevented the proper working of the breech mechanism.

Berdan, ·45 inch.

(2.) With Side Lock.

Unless carefully shut, the hammer of this rifle falls on the hinge that closes the breech instead of on the striker. The quick and proper working of the breech action depends upon the hinge called the "brace," which at once becomes affected by exposure to weather. The piston is liable to become fixed out by rust.

Berdan, ·45 inch.

(3.) Sliding Bolt.

This rifle was submitted after the committee had decided from previous experiments to reject all sliding bolt guns as being liable to accident with an over-sensitive cartridge.

Benson.

If dirt or sand enters the shoe of this rifle it causes miss-fires, and even prevents the bolt from entering the aperture in the block. The working of the breech mechanism is slow.

Braendlin Snider.

In this rifle there is a liability to miss-fires when sand or dirt clogs the breech, and prevents the bolt fairly entering the hole in the block. Other methods of securing the breech block are preferred.

Cole, ·577, ·45 inch.

These rifles were not fired, as they bore no proof marks. It is possible to place the cartridge in front of the extractor.

Conroy, ·577 inch.

The breech mechanism is more complicated than that of many other rifles. The rifle is a large bore, and consequently has a shorter cartridge than could be used in a small bore.

It is doubtful whether the extractor would answer with a long cartridge.

Cooper, ·577 inch.

In this rifle the breech block is kept open by a spring, which is always in a state of tension when the breech is closed. There is a liability to miss-fires.

**Chassepôt.*

There were continued miss-fires with this rifle, and considerable fouling about the point of the breech bolt. The India-rubber wad in the percussion cap was almost invariably left in the rifle after discharge, and was also blown into the breech-bolt, thus clogging the needle. After a miss-fire the ramrod has to be used to push out the cartridge.

Davies.

The breech mechanism of this rifle is more complicated than that of other systems, and the manipulation is slower.

Fosbery, ·5 inch, elevating block.

In the sand trial this rifle worked with difficulty. A touch of the finger is required to complete the ejection of the empty case.

Fosbery, ·45 inch, falling block.

In this rifle the extractor occasionally failed to withdraw the empty case, owing, as stated by Major Fosbery, to defective chambering. The breech cannot be closed after sand has been thrown on it.

Gordon.

This rifle is a modification of the Snider system. Rifles, in many respects resembling it, have been reported on.

Gielgud (Peabody), ·45 inch.

Mr. Gielgud withdrew this rifle, on being informed that other systems, on somewhat similar principles, were preferred to it.

Larsen, ·45 inch (4 rifles).

One rifle of this system was fired (due precautions being taken) with the breech-lever not quite home, the escape of gas destroyed the stock and rendered the arm unserviceable. All the rifles appear liable to an accident of this kind.

Money-Walker, ·5 inch.

By exposure to weather the breech mechanism of this rifle is liable to become jammed and unserviceable. A smart blow is necessary to ensure the breech mechanism being closed.

Mabbutt, ·577 inch.

The breech block is liable to fall down while the empty case is being thrown out. The manipulation is slow. Sand or dirt entering the hole which contains the plunger causes difficulty in opening the breech block.

Newark.

The breech mechanism of this rifle is a modification of the Snider principle.

The method of bolting down the block in this rifle appears simple. The wood of the stock is more cut away than is the case in an ordinary Snider block.

The Committee recommended that it should be brought under the notice of the Superintendent R.S.A. factories at Enfield.

Needham, ·577 inch.

Although the breech mechanism of this rifle is strong, it is not so handy as others.

Peabody, ·5 inch, with trigger guard lever, adapted for Boxer compressed powder cartridges.

In this rifle the breech action jammed during the rapidity trial, which had to be discontinued. The breech mechanism worked stiffly.

Peabody, ·45 inch, modified Peabody rifle with lever above, instead of below, adapted for Berdan central fire cartridges.

The Committee had before them rifles which they preferred to this. Mr. Gielgud accordingly withdrew it.

---

* In some Chassepôts shown to the Committee on a subsequent date, which were stated to be of more perfect make, these miss-fires did not occur, but after a few rounds some difficulty was found in forcing the cartridges into the chamber.

Peabody—Gielgud—Wessely.

This rifle became unserviceable when sand was thrown on the breech open. The breech action is simple and strong. Mr. Wessely withdrew the arm stating that it was not a perfectly finished specimen.

Prussian Needle Gun.

The breech mechanism of this rifle was slower and more difficult of manipulation than that of many other arms brought before the Committee. The rifle is liable to the objection of arms using the paper cartridge. There was a great escape of gas at the breech.

Punshon Snider, ·577 inch.

The extractor of this rifle jammed when sand was thrown on the breech mechanism. After firing, the hammer frequently passed over the catch of the bolt, and so failed to release the spring which holds down the breech block. The breech was blown open by a damaged cartridge.

Reilly-Comblain, ·577 inch.

The Committee made no experiments with this arm as they had before them systems of breech mechanism which they preferred.

Ross (P. Campbell).

No ammunition was submitted with these rifles. Other systems are preferred.

Russian converted, ·577 inch Needle Rifle.

This rifle became unserviceable when fine sand was thrown over the breech arrangement. There was great difficulty in withdrawing the cartridge after a miss-fire.

Russ and Hammond ·577 *inch.*
„ „ ·45 *inch, Paper Cartridge.*

These rifles are slow in manipulation, although their breech mechanism is strong. Other systems are preferred.

Roden Snider.

With this rifle the jerk which is required to eject the empty case renders the breech block liable to fall over. The locking bolt appears to be inferior to other systems of securing the breech block.

Stoakes, ·577 inch.

The piston of this rifle being broken it could not be fired, and there was no suitable ammunition wherewith to try the small-bore barrel.

Stoakes, ·45 inch.

The breech mechanism is liable to be rendered unserviceable by sand or dirt entering the several parts. There were no proof marks on the rifles.

Stiff.

This rifle was not submitted until the Committee had expressed an opinion adverse to sliding bolt guns generally. They have before them other rifles on the bolt system which they prefer.

Tranter, ·577 inch.

This rifle became unserviceable when sand was thrown over the breech mechanism.

Wanzel (1), ·45 *inch.*
„ (2), ·45 *inch.*

There is liability to miss-fires and to failure in extraction of the cartridge case in these rifles. Other systems of breech-loading are preferred.

Werndle, ·45 inch.

In this rifle the action of the extractor is uncertain. Dirt or sand thrown over the breech arrangement prevents it from working.

Witney.

Dirt or sand entering the working parts of the breech action renders the gun quite useless. It is capable of being fired rapidly when in good working order.

Wyley (2 *rifles*), ·577 *inch.*
„ ·45 *inch.*

These rifles were received after the decision of the Committee against bolt guns. They have rifles before them on the bolt system which they prefer.

APPENDIX IV.

DESCRIPTION OF ARMS.

Bacon.

This rifle is adapted for the Boxer cartridge.

The breech is closed by a sliding bolt worked by a lever handle.

The explosion is caused by a direct acting piston driven by a strong spiral spring in the bolt, which also does the duty of a sear spring. The action of pushing forward the bolt and closing the breech, compresses the spring, and when the handle is turned down the arm is ready to be fired.

The empty cartridge case is withdrawn from the chamber and thrown out in drawing back the bolt to open the breech.

Berdan.

This rifle is adapted to Berdan central-fire drawn brass cartridges. The barrel and shoe are in one piece. The breech is closed by a block which folds forward on a hinge over the chamber.

The explosion is caused by a loose piston passing diagonally through the block, driven by the hammer of a common side lock. The breech is opened by raising and swinging forward the breech block; in doing so, the extractor spring is compressed and at the end of the motion suddenly released, causing the empty case to be flipped out.

A brace working in a mortice in the block, the rear end of which has a curve struck from a centre below the axis of the rifle, falls in shutting down the block into a corresponding curve in the shoe, and effectually prevents the possibility of the breech being blown open by a damaged cartridge.

Carter and Edwards.

This rifle is adapted for the Boxer cartridge. The breech is closed by a sliding bolt, worked by means of a lever handle curved down so as to lie when shut against the side of the stock, and prevent an unsightly appearance and the chance of catching in the clothes or accoutrements.

The cartridge is exploded by means of a direct acting loose piston passing through the bolt, and driven by a hammer and flat spring in the centre of the stock. This piston has a head, the inner face of which is cut in an incline, there being a similar incline on the heel of the bolt; it is of sufficient length to strike the cartridge only when these inclines coincide, and this can only occur when the handle of the bolt is turned down in a position of safety. In turning the bolt for the purpose of opening the breech, the piston head, which travels in a groove in the shoe, is unable to turn with it, and is consequently forced back and the piston withdrawn.

In drawing back the bolt the breech is opened, and

the hammer pressed down to full cock, the cartridge case is withdrawn into the shoe, and thrown out by a slight cant of the rifle.

When the bolt is pushed forward and the handle turned down into its place, the rifle is ready to be fired.

The lock arrangement is in five pieces, is very simple and strong; it can be carried at half cock, and is provided with a safety bolt.

Henry.

This rifle is adapted for the Boxer cartridge.

The breech is closed by means of a breech block which works vertically by the movement of a lever, which is fastened by a catch underneath the trigger guard; the same movement causes the extractor to eject the empty cartridge case.

The cartridge is exploded by a piston passing diagonally through the breech block, and driven by a common side-lock and hammer; on raising the hammer the piston is withdrawn by the action of a spiral spring.

Mr. Henry has another system of withdrawing the piston which dispenses with this spring, the piston being withdrawn by the act of opening the breech.

Kerr.

This rifle is adapted for the Boxer cartridge. The breech is closed by means of a sliding bolt, worked by a lever handle.

The cartridge is exploded by a direct acting piston which is driven by a common side-lock, and so arranged that it cannot be struck by the hammer until it is in a position of safety. On raising the hammer the piston is withdrawn by means of a spiral spring. Mr. Kerr, however, states that this spring could be dispensed with.

The discharged cartridge case is withdrawn from the chamber on drawing back the bolt, and is thrown out by giving the rifle a slight cant to the right.

There is a slight incline in the fore end of the shoe which gives to the bolt, in shutting and opening, a screw motion, the effect, in the first instance, being to gently but firmly press home the cartridge, the shock being taken by the shoe, and thereby the risk of an accidental explosion diminished; in the latter, to facilitate the extraction of the empty case.

Martini.

This arm is adapted for the Boxer cartridge.

The breech is closed by a block which swings on a pin passing through the upper rear end of the shoe, the recoil being taken by the shoe.

The cartridge is exploded by a direct acting piston, which is driven by the action of a strong spiral spring within the breech block.

This block is acted on by a lever to the rear of the trigger-guard. The act of pushing the lever forward causes the block to fall, the spring to be compressed, and the empty cartridge to be thrown out to the rear: on drawing back the lever, the block is raised so as to close the breech and the arm is ready to be fired. It can be placed at half-cock, and it is also provided with a safety bolt.

Money-Walker.

This arm is adapted for central fire metallic cartridges.

The breech is closed by means of a block, working on a pivot or centre which passes through it and the sides of the shoe, and which takes the whole recoil. The fore part of this block contains the lock, and the rear part serves as a lever handle: on raising the handle the fore part of the block is depressed, thereby opening the breech, compressing the spring which drives the piston, and causing the extractor to eject the empty case; on lowering the lever the breech is closed, and the arm is ready to be fired.

Westley Richards.—No. 1.

This rifle is adapted for a central fire metallic cartridge.

The breech is closed by a block swinging on a pin which passes through the upper rear end of the shoe.

The lock is contained in the block. By pushing forward a lever which is fastened by a catch to the trigger-guard, the block is lowered and the flat spring compressed, which acts on a hammer striking upwards and against the base of the piston which, when the block is opened, is always withdrawn, and a continuation of the motion causes the extractor, which is part of this lever, to withdraw the cartridge case: on drawing back the lever, the block is raised and the rifle ready to be fired.

Westley Richards.—No. 2.

This rifle is adapted for central fire metallic cartridges.

The breech block consists of two main parts connected by a hinge, and the whole fastened by a hinge to the upper part of the shoe, where the barrel is screwed in. The block which closes the breech contains the lock and piston, the other, or tail piece, is the lever by which the action is opened; when shut, this tail piece rests against the curved end of a corresponding curve in the shoe, both struck from a centre below the axis of the rifle, and thus making the action secure.

The breech is opened by raising the tail piece and continuing the motion so as to fold over the barrel the two pieces composing the action; in so doing, the spring which drives the piston is compressed, the piston withdrawn, and the extractor caused to withdraw the cartridge case.

In closing the breech, the block containing the lock is first lowered, and a continuation of the motion shuts the tail piece into its place; the rifle is then ready to be fired.

A more perfect description of these systems could have been given had they not been withdrawn by Mr. Westley Richards.

Wilson.

This rifle is adapted for the Boxer central fire cartridge.

The mechanism is on the bolt system.

The breech is closed by pushing forward the bolt with the ball of the hand, and when in its place is secured by two lugs on a movable collar, which are forced into corresponding slots in the shoe, by means of a spring in the shoe-cap.

The explosion is caused by a direct acting piston within the bolt, which is driven by a spiral spring: on withdrawing the bolt, the empty cartridge case is extracted and thrown out.

APPENDIX V.

Men were working behind the butts during the firing of the Henry rifle at the 1,000 yards range, and consequently it was necessary to make the point of impact lower than usual in order to prevent the chance of a shot going over the target. Thus misses (short) occurred in shots which would otherwise have struck the target, and the average was consequently slightly deteriorated.

LANCASTER.

APPENDIX VI.

LETTER FROM MR. LANCASTER.

151 New Bond Street, London,
SIR, September 21st.

IN reply to *Ordnance Select Committee letter, 16/9/68 min. $\frac{2560}{3}$, and in reference to the interview of Thursday last, I beg to inform you that the six barrels rifled on my system for loose powder are quite ready and shall be forwarded this week.

As I had the honour of explaining personally, I have to regret that I have not been able to complete the series of trials necessary to determine the proper ammunition to be used, every trial having to be conducted by myself, no person in my employ being capable of so responsible a duty, and being unable, owing to the requirements of my private business, to devote two months undivided attention away from it, the time a proper investigation of the subject would demand. Still, permit me to assure the committee that I have, so far as was in my power, devoted myself to the purposes of the government in this matter.

If therefore it is found by the committee that through any lack of time necessary for the trials of ammunition to develop the full merits of the system of rifling the shooting is not equal to the requirements, it will be to me a matter of great regret; but I shall not the less accept any conclusions arrived at by the committee on breech-loading rifles, although I am satisfied that all things being equal, the oval bore system will hold its own with any other system of rifling as proved by 18 years continuous trials by the Ordnance Select Committee, and on service, the question of ammunition being one merely involving a certain expenditure of time, and certain facilities in conducting experiments which under present circumstances I am compelled to leave in the hands of the proper authorities.

I have, &c.,
(Signed) CHARLES W. LANCASTER.

The President Committee
on Breech-loading Rifles.

APPENDIX VII.

LETTERS FROM MR. RIGBY.

24, Suffolk Street, Dublin,
SIR, 28th October 1868.

IN compliance with your notification of the 21st instant, I send to you the Henry rifle, to which I have fitted four barrels rifled on my system. I do not send any cartridges, as I am not prepared at present to submit a sample of ammunition; my experiments showing that even the best which I have heretofore tried is capable of improvement. In fact my most recent trials indicate plainly that the removal of the chief sources of inaccuracy in breech-loading rifles is quite attainable, and I desire to pursue these investigations further before I submit the results to public trial.

I am, &c.,
JOHN RIGBY.

The Secretary,
*Ordnance Select Committee.

24, Suffolk Street, Dublin,
SIR, 6th November 1868.

I HAVE been engaged since my return here in gathering up the result of my previous experiments, and have determined the most important points. I am now *most desirous* to submit ammunition for my barrels, and to withdraw mine of the 28th on this subject. If the committee can possibly give them a trial, I think it will be more satisfactory than that they should have incurred the expense of my barrels, &c., without obtaining any result.

Your reply by return of post will oblige, and meanwhile I will make preparations to send in the rifle and ammunition as soon as possible after receipt of your reply.

What I would desire would be a comparative simultaneous trial with the best shooting arm you have as yet got, and I am prepared to attend personally for that purpose.

I am, &c.,
(Signed) JOHN RIGBY.

The Secretary,
*Ordnance Select Committee.

24, Suffolk Street, Dublin,
SIR, 25th November 1868.

I HAVE this day received from my agent in London, a report of partial trial of barrels and ammunition sent in by me. The result is so different from that of previous ones made in Dublin, that I am certain that the ammunition sent in has been defective from want of time to prepare proper apparatus for making it. As I had not time to complete the experiment in progress, and the committee cannot further extend the time for testing the barrels, I desire that the incomplete trial may not be recorded, but that the matter may be permitted to rest on the basis of my letter of the 28th October.

I am, &c.,
(Signed) JOHN RIGBY.

The Secretary,
*Ordnance Select Committee.

---

* By Ordnance Select Committee is meant the Committee on Breech-loading Rifles.

APPENDIX VIII.

PENETRATION TRIALS.

Detail of Shots.

Rifle.	Range, in Yards.	Elm Planks Half an Inch thick and One inch apart.

Rifle.	Range in Yards.	Description of wound on Horse.
inch.		
Henry ·45	200	Simple bullet wound, a punctured wound in shoulder, bullet went through.
,,	,,	Struck six inches lower than No. 1 shot, just to right of near shoulder blade, went clean through, making a very large lacerated wound on exit.
Snider ·577	,,	Struck thigh bone without breaking it, bored along soft tissue, bullet remained in.
Snider ·5	,,	Touched on the bone and the bullet did not go through, but lodged in the flesh high on the near hind quarter, and was cut out much flattened up.
Henry ·45	50	Broke thick part of bone of hind leg to pieces, the lower part of thigh bone of off hind leg, the bullet remained in, the bone was smashed to pieces.
Snider ·577	,,	Struck shin bone of near hind leg, a compound fracture, the ball passed through, not so bad a wound as No. 5.
Snider ·5	,,	Struck upper part of off fore leg, the bullet passed through, bone broken, not so bad a wound as either No. 5 or 6.
Henry ·45	,,	Struck near shoulder, smashed shoulder bone into so many pieces that it was like small shot, bullet cut out from skin of off shoulder, a piece of bone was carried through.
		Several other shots were fired with the Snider and passed through the fore legs without breaking the bone.

APPENDIX IX.

LETTER FROM VETERINARY SURGEON HARRISON, R.H.A.

Sir, Woolwich, 9th Nov., 1868.

In witnessing the firing upon a recently killed horse, on the 3d instant, I have the honour to state that the bullets on striking the bones produced very complete and severe fractures, breaking the bones into splinters; and, therefore, presuming the horse had been alive, entirely incapacitating him from any progressive motion.

The smaller bullets appeared to me to produce the most severe fractures, the larger ones more disposed to flatten and traverse the soft tissues adjoining the bones.

I have, &c.,
(Signed) Edwd. O. Harrison,
V. Surgeon, R.H.A.

The President of the Small Arms Committee.

APPENDIX X.

LETTER FROM SUPERINTENDENT OF ROYAL GUNPOWDER FACTORY.

Royal Gunpowder Factory,
Sir, Waltham Abbey, April 12, 1868.

In reply to your letter of the 2d instant, requesting a report upon the manufacture of a powder similar to Curtis and Harvey's No. 6, for the information of the Committee on breech-loading rifles, I beg to say that a powder very similar to the above could be made here by introducing the following changes in the manufacture of the service R. F. G. powder :

1. Charcoal burned at a lower temperature.
2. The charge taken off the mill bed in a moister condition.
3. Pressed to a higher density.
4. More highly glazed, and sifted to a more uniform size of grain.

The additional cost of such powder would probably not exceed five to six shillings over the present price of R. F. G.

If the Committee desire some powder of this kind for experiment, I will ask the authority of the Secretary of State to manufacture it.

The least quantity that could be produced will be two barrels. I may add, that as Curtis and Harvey's No. 6 powder has been found to give more uniform results than service R. F. G. I think this experiment very desirable.

I have, &c.,
C. W. Younghusband,
Col. R.A.

The Secretary Committee on Breech-loading Rifles.

APPENDIX XI.

Royal Small Arms Factory, Enfield,
2nd December 1868.

Estimate of the cost of supplying steel barrels in the Royal Small Arms Factory, in large quantities, and of uniform quality, of the following patterns :—

The estimate is taken upon 1,600 barrels per week as the number which will involve the department in the least amount of extra outlay for additional machinery, although the factory has produced 2,300 per week under pressure.

	£	s.	d.
Enfield pattern '53, ·577 inch bore, without back sight or action, - - of which 8½*d.* is paid for rifling.	0	15	5
8 Turning lathes @ 86*l.* each -	688	0	0
4 First boring machines @ 50*l.* each	200	0	0
The above would be required in addition to present machinery.			
Enfield ·5 inch bore, without back sight and action - - - - of which 1*s.* 1½*d.* would be paid for rifling.	0	18	9
Extra Machines, as before - -	888	0	0
13 Additional rifling machines @ 130*l.* each - - - -	1,690	0	0
Enfield ·45 inch bore, without back sight or action - - - - of which 1*s.* 3*d.* would be paid for rifling.	0	19	0
Extra machines, as before - -	888	0	0
17 Extra rifling machines @ 130*l.* each - - - - - -	2,210	0	0
Henry ·45 inch bore, without back sight or action - - - - - of which 2*s.* 0½*d.* would be paid for rifling.	0	19	9½
Extra machines, as before - -	888	0	0
40 Additional rifling machines @ 130*l.* each - - - - -	5,200	0	0

A separate building would be required for the large number of extra rifling machines.

Independently of the above expenditure, it would be necessary to expend about 240*l.* in altering 12 of the present number of rifling machines, in order to enable them to cut grooves with a quick pitch of 20 inches.

The great number of extra rifling machines required for the Henry barrel is owing to the extra time which this barrel will require for rifling ; it is estimated that only five per diem can be rifled in one machine, and, probably, from the great delicacy of this nature of rifling, this number might not be produced for some time.

(Signed) W. M. Dixon,
Col. and Superintendent.

APPENDIX XII.

Royal Small Arms Factory, Enfield,
14th December 1868.

Secretary Committee on Breech-loading Arms,

Mr. Henry came to this factory on the 9th instant, and the enclosed memorandum was made by my manager. I was away, and did not see Mr. Henry.

With reference to the memorandum, I should like for the committee to obtain for me, from Mr. Henry, the real pattern for his rifling, viz :—a piece of barrel showing the true form, depth, &c., of the grooves, and their number, also a standard cutter.

With respect to remark No. 7, it is impossible for me to view any work in a vague, undecided way, as suggested in this remark. The only toleration allowed

in the rifling, or in the bore of the arm, is in the sense of approaching as nearly as possible to the pattern, without expecting to be always absolutely correct.

Mr. Henry's barrels, as rifled in Birminghan, are not viewed, therefore it is very possible he may get them done cheaper and quicker than they would be done here. I can only accept the pattern and work as closely as possible to it.

As soon as I have received the real pattern of the rifling and the cutter, I shall then be in a position to re-consider my estimate of the cost of the operation as already furnished to the committee.

(Signed) W. M. Dixon,
Col. and Superintendent.

Memorandum of remarks made by Mr. Henry on his last visit to Enfield, December 9th, 1868, with respect to the rifling of his barrels :—

1. The piece of barrel and the cutter sent to Enfield does not represent Mr. Henry's views, and they were not submitted to the Ordnance Select Committee* as patterns from which an estimate could be made, but merely to show the form of rifling

2. The rifling should be septangular, one turn in 22 inches.

3. The bore not to exceed ·451 inch when finished.

4. A pattern, showing the exact form of rifling, will be supplied.

5. A standard cutter showing the degree of angle on each side of the hand ridge will be supplied.

6. The angles on the cutter should be equal.

7. There is no necessity for the view to be very strict, as a slight variation in the depth or form of the angles does not affect the shooting.

8. A man in Birmingham rifles these barrels at the rate of 20 per diem with one machine only, but the barrels are not viewed after being rifled.

APPENDIX XIII.

Sir, Edinburgh, 22d December 1868.

Referring to your letter $\frac{2.5.6.9}{3}$ of December 3rd in which you inform me you have enclosed copy of a letter from the superintendent R. S. A. Factory, Enfield, giving an estimate for rifling steel barrels of various calibres, and of different systems, and requesting me to forward to your Committee any remarks I might wish to offer on the subject, especially with reference to my own arm, and also desiring me to give an estimate of the cost of supplying 1,000 steel barrels rifled on my system, and a further estimate for 100,000 complete rifles, having my patent rifling and breech action, with the cost of rifling and rate per week they could be turned out, I have now the honour to inform you that after placing myself in communication with those best able to afford me accurate information on the subjects referred to I am enabled to report as follows :—

1st. From my own personal experience, and that of Mr. Allport, a Birmingham manufacturer, who has rifled a very large number of barrels on my system during the past eight years, it is clearly evident that the estimate furnished you by the superintendent R. S. A. Factory at Enfield, for the supply of barrels rifled on my system is based upon wrong premises.

In that estimate the cost of rifling a single barrel of ·577 calibre on the Enfield system is fixed at $8\frac{1}{2}d.$, for a barrel of ·500 calibre on the same system $1s.$ $1\frac{1}{2}d.$, for a barrel of ·450 on the same system $1s.$ $3d.$, whereas the cost of rifling a barrel of ·450 calibre on my system is shown to be $2s.$ $0\frac{1}{2}d.$

The letter annexed marked "A" is a copy of one received from Mr Allport, and he from his long experience estimates the cost of rifling a barrel on my system, over that of the ordinary Government Enfield of ·577 bore at $1d.$ only, and about 20 barrels could be rifled in one machine per day.

The letter annexed marked "B" is a copy of one received from the manager of the Birmingham Small Arms Company, and had no further statement been furnished it must have been sufficient evidence that the cost of rifling barrels on the Henry system only slightly exceeds those rifled on the Enfield system, but the manager of the company verbally stated to myself and Mr. Newby that the additional cost of rifling barrels of ·450 calibre on my system over that of the three-grooved long, or five-grooved short Enfield would not exceed $2d.$ per barrel, and about 18 barrels could be rifled in one machine per day of 10 hours.

Thus according to S. B. Allport's statement of 20 barrels rifled in one machine per day, it would require about 15 machines to rifle 1,600 barrels per week, and if, according to Enfield estimate ·577 gauge Enfield cost $8\frac{1}{2}d.$ per barrel to rifle, the Henry ·450 would cost $9\frac{1}{2}d.$

According to Small Arms Company's statement of 18 barrels rifled in one machine per day, it would require about 17 machines to rifle 1,600 barrels per week, and if, according to Enfield estimate ·577 gauge Enfield cost $8\frac{1}{2}$ per barrel to rifle, the Henry ·450 would cost $10\frac{1}{2}$.

Presuming only 15 barrels to be rifled per day in one machine at Enfield Factory, about 20 rifling machines would be required in all, to produce 1,600 barrels per week.

2nd. I can supply 1,000 best steel barrels of ·450 calibre, rifled on my system, with either seven or nine cuts, and without backsight or action, at $15s.$ each. If of foreign production a lower price can be quoted.

3rd. 100,000 rifles, with steel barrels of ·450 calibre, rifled on my system, and with my patent breech action, can be supplied of English manufacture at $50s.$ and upwards. If every part is to be submitted to Government gauge and view, the Birmingham Small Arms Company's quotation is $65s.$ each, and the rate of delivery 1,000 to 1,200 per week.

If cheapness is sought after, arms of foreign manufacture can be supplied at $45s.$ and upwards.

In accordance with the wishes of the Committee I went to Enfield on the 9th instant, but was unfortunately unable to see Colonel Dixon, who was engaged in town. I, however, had an interview with the manager and others connected with the rifling department, and entered fully into explanations of my system of rifling, showing the ease with which it is produced, and my explanations were apparently satisfactory. After a second visit to Birmingham, I again went to Enfield yesterday, and had a long interview with Colonel Dixon, and after fully discussing the various points in connexion with the production upon a large scale of rifle barrels on my system, I handed him the following specification, with which he expressed his satisfaction, and stated that the margin allowed would materially alter his original estimation.

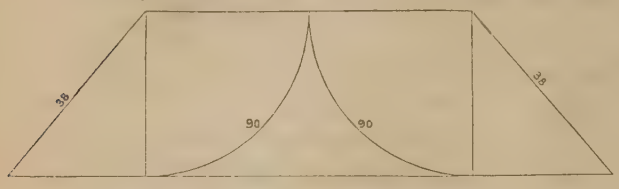
In small-bore breech-loading arms satisfactory results can be obtained with this system of rifling, varying in gauge from ·449 to ·451, using the same description of bullet (or ammunition) for both, ·450 being preferred as the standard gauge. Absolute perfection in the shape of the re-entering angles is not necessary, provided the concentricity with the planes be retained, nor would a slight error in respect of one angle differing from the rest, in a barrel rifled on this system, interfere perceptibly with the accuracy of its shooting. A seven cut with planes ·135 to ·138 in breadth, and the sides of the re-entering angles as

* By Ordnance Select Committee Mr. Henry evidently means the Committee on Breech-loading Rifles.

diagram below, will, with ·450 minor diameter, give ·465 major diameter.

In a nine cut rifle on the same principle, ·450 minor diameter, and ·462 major diameter, are found to give results very nearly equal.

As mathematical accuracy is not indispensable with this system of rifling, a reduction in the major diameter to the extent of three or four thousandths of an inch may be made without affecting the accuracy of the shooting, and this in the manufacture of large quantities is a very great consideration.



I left with Colonel Dixon specimens of rifled tubes, also sectional specimens, and the tool with which the 7-cwt. tube was rifled.

These were intended as a guide for the manufacture of the cutters.

I have, &c.
(Signed) ALEXR. HENRY.

The President Committee
on Breech-loading Rifles.

"A."

Gun and Pistol Manufactory,
50 Whittal Street, Birmingham,
7th December 1868.

Mr. A. Henry, Edinburgh.

DEAR SIR,

IN answer to your inquiry as to the relative cost of rifling barrels (whether of ·450 or ·577 calibre) on your system, or that of the ordinary service arm, the experience gained in the rifling of over two thousand barrels on your system enables me to judge that upon a large scale the rifling of barrels on the "Henry" system would not exceed that of the Government Enfield by more than *one penny* per barrel.

Respecting the difference in the cost of rifling a barrel with seven or nine cuts there is practically none whatever, for your principle requires the cut to be somewhat deeper in the seven than in the nine-grooved barrel, and this compensates for the extra number of cuts.

With regard to the facility of production, I would not, without the experience of larger quantities at one time, assert that I could cut more than 20 barrels in one machine per day of ten hours.

The cost of the barrels would entirely depend upon the quality required; and the same description being necessary for either system of rifling, this question can only be answered upon receiving a full specification.

I am &c.
(Signed) SAMUEL B. ALLPORT.

"B."

Small Arms Factory,
Smallheath, Birmingham,
December 7th, 1868.

DEAR SIR,

IN reply to your inquiry, I beg to inform you that in any large order for guns, say 50,000, I should not think of adding anything to the cost on account of your system of rifling, although it would be rather more expensive than the Enfield system of rifling.

I am &c.,
(Signed) B. MCKAY, MANAGER.

Alexander Henry, Esq.,
Stork Hotel, Birmingham.

APPENDIX XIV.

Royal Small Arms Factory, Enfield,
13th January 1869.

Secretary Committee on
Breech-loading Arms.

Subsequently to my report dated 2d December 1868 on the estimated cost of small-bore arms, as far as the rifling was concerned, I have by actual experiment been able to arrive at a closer approximation upon the subject of prices.

I have also been furnished by Mr. Henry with an exact description of his rifling, and as the form of groove, the twist, and depth have been now settled, I can make a considerable reduction in my former estimate of the cost of rifling his barrels.

Experiment has also proved that the ·5 and ·45 Enfield barrels can also be reduced in cost of rifling, or in other words, the machines can produce more work than I had calculated upon.

The revised estimate will therefore stand as follows:

Enfield ·5-inch bore.

Cost of barrel 18*s.* 5½*d.*, of which 10*d.* would be paid for rifling.

	£	*s.*	*d.*

No building in this case would be required for the additional rifling machines.

The experiments were conducted on a ·45 inch barrel cutting seven of Mr. Henry's grooves.

In cutting nine grooves I find that less metal will have to be removed, but there will be two additional grooves.

It is probable that an equal number of barrels can be rifled with nine or with seven grooves.

The only question that I cannot quite speak with confidence upon, is on that of waste or indifferent work.

In cutting Mr. Henry's grooves there is a greater chance of waste than in the Enfield system. Considerable experience can alone determine whether the waste is excessive.

(Signed) W. M. DIXON,
Colonel and Superintendent.

13th January 1869.

APPENDIX XVI.

Chemical Department,
Royal Arsenal, Woolwich,
4th February 1869.

SIR,

IN reply to your communication of the 2nd instant, I have the honor to state for the information of the Committee on breech-loading small arms, that there is, in my opinion, no likelihood of the mechanism of the Martini breech-loading system being injuriously affected by the deposition of fouling upon it.

The fouling, or powder residue, being of a powerfully alkaline nature, will not exert any corrosive action upon the metal surfaces with which it comes in contact; alkaline substances are, indeed, applied to iron and steel surfaces, as protectives against oxidation.

The only circumstance under which the deposition of fouling might perhaps give rise to some injurious effect upon the mechanism, would be the keeping of the dirty arm *for some time* in damp localities.

I am, &c.,
(Signed) F. A. ABEL,
Chemist of the War Department.

Captain Rawlins,
&c., &c., &c.

APPENDIX XVII.

11,122 2/15.

Royal Laboratory, Woolwich, S.E.
January 11, 1869.

MEMORANDUM for Committee on Breech-loading Small Arms.

WITH reference to Captain Rawlins' letter of the 18th ultimo, Minute 339 25/3 6 9, I beg to state, that the comparative cost of manufacturing in large quantities the present service Boxer ammunition, and that which is being at present made up for the Henry ·45 inch bore, is as follows :—

	per 1,000 rounds.
Present ammunition - - -	£3 2 0
Henry ·45-inch - - - -	4 7 5

I would observe, however, that this last price is for ammunition made up with the special powder hitherto used in cartridges for the Henry rifle.

If we use the ordinary rifle F. G. powder, the cost would be reduced by about 11*s.* per 1,000 rounds.

The cost of bullets also is estimated for casting, instead of squirting the alloy into a rod, as we are not *certain* that a squirting apparatus could be obtained for forming the rod from the hard alloy of which the bullets are made.

Should we be able to form the alloy into rods, a considerable saving would be effected in the cost of the bullets.

(Signed) E. M. BOXER,
Supt. R.L.

APPENDIX XVIII.

Minute 26,139.

1641. STRENGTH of GUNPOWDER.
2367. PERFORATED and COMPRESSED POWDER.
2560. COMMITTEE on B. L. SMALL ARMS.

3

With reference to *Minute* 21,506. Secretary submits for record the following abstract prepared by Captain W. H. Noble, R.A., 14/8/68, giving the results of experiments (in continuation of those reported on *Minute* 21,506,) which he carried out for the Committee on B. L. Small Arms, to ascertain the strength and uniformity of various descriptions of perforated and compressed charges of gunpowder fired from the Henry B. L. small-bore rifle (0·45 inch) No. 3, the chamber of which had been lengthened, the front part having now a much shorter taper than formerly. Boxer cartridges were used throughout, with a solid bullet hardened.

The following were the descriptions of charges tried, all perforated with one bore in the centre :—

No. 1,—80 grains „ 2,—82 „ „ 3,—86 „	F. G. charge in one pellet, compressed in the original way ; *i. e.*, pressure applied at one end of the pellet, so that its densest portion is next the cap, and lightest portion next the bullet. The perforation being in the dense end, and the indentation in the light end.
„ 4,—80 „ „ 5,—82 „ „ 6,—86 „	F. G. charge in one pellet. Pressure reversed. Perforation original.
„ 7,—80 „ „ 8,—82 „ „ 9,—86 „	F. G. charge in two pellets, resting on one another, perforation in each in the end next cap, other extremity solid, without indent.
„ 10,—80 „ „ 11,—82 „ „ 12,—86 „	F. G. do do. when together 0·1 longer than Nos. 7, 8, 9.
„ 13,—80 „	F. G. charge in two pellets, compressed from both ends. Perforation original.
„ 14,—85 „	Curtis and Harvey No. 6, loose.
„ 15,—82 „ „ 16,—86 „	F. G. charge in one pellet, compressed from both ends. Perforation original.
„ 17,—86 „	F. G. charge in one pellet, compressed in original way.
„ 18,—86 „	Enfield rifle powder ; charge in one pellet. Compressed and perforated in original way.
„ 19,—86 „	Curtis and Harvey No. 6 ; charge in one pellet. Compressed and perforated in original way.

Nos. 1 to 14 were fired by alternate rounds. Nos. 15 to 19, separately in groups.

After a few trials it was found that the bullets of Nos. 4, 5, and 6 turned over almost immediately, and prevented any accuracy, they were therefore set aside without being tried further.

Nature of arm and date of experiment.	No. of rounds.	Charge and nature of powder.	Projectile mean weight.	Observed velocities at 82 feet.						Mean observed velocity.	Mean difference of velocity.	Calculated mean initial velocity.

* Curtis and Harvey.

The results show :—

1. That on the whole, the original method of applying the pressure is the best
2. It is probable that rifle F. G. powder will give good results when pressed.
3. Curtis and Harvey, No. 6, when pressed gives bad results, showing that it is not suitable for making compressed charges.

Minute 24,298.

1321. Navez's Electro-ballistic Apparatus.
1641. Strength of Gunpowder.

Captain W. H. Noble, R.A., 18/2/68, submits for record the following results of an experiment carried out in conexion with the use of compressed charges in proof cartridges for Snider B. L. Enfield rifles.
The rounds were fired alternately from a service Snider Enfield.

Date of Experiment.	No. of Rounds.	Charge.	Cartridge.	Projectile. Nature and length.	Projectile. Mean weight and diameter.	Observed velocities at 27·3 yards.					Mean observed velocity.
		Grains.			Grains.	Feet.	Feet.	Feet.	Feet.	Feet.	Feet.
14/8/67	5	137*	Boxer	Leaden bullet, hemispherical head. 1·08 inch.	720	1443·6	1448·5	1456·3	1438·6	1437·1	1444·8
					Ins.

* Compressed. † Loose.

It appears from this that the compressed charge gives an increase of 50 feet velocity, and that it requires 147 grains of loose to equal 137 of compressed powder.

Minute 24,793.

1641. Strength of Gunpowder.
2367. Perforated and Compressed Gunpowder,—Proposed 19/9/62. *Minute* 7420.
2560. Committee on B. L. Small Arms.

3

Captain W. H. Noble, R.*A.*, 28/4/68, submits for record, with reference to *Minute* 24,037, the following abstract, giving the results of an experiment which he carried on for the Committee on B. L. Small Arms, to ascertain the strength and uniformity of perforated and compressed charges of gunpowder, in comparison with loose powder when fired from B. L. rifles.

The arm used was the Henry B. L. small-bore (0·450 inch) rifle, and the questions to determine were,—

1. What charge of compressed powder would give the same initial velocity as 85 grains of loose powder.
2. Whether the uniformity of the velocity was effected by the use of the compressed charge.

Nature of Arm and Date.	No. of Rounds.	Charge and Nature of Powder.	Observed velocities at 82 feet.					Mean observed velocity.	Mean difference of velocity.	Calculated mean initial velocity.	Remarks.
			Feet.	Feet.	Feet.	Feet.	Feet.	Feet.	Feet.	Feet.

			1292·9	1305·3	1305·3	—	—				
Henry B. L. rifle No. 3. 21/4/68.	18	86 grs. compressed F. G.	1290·9	1294·9	1294·9	1296·0	1289·9	1291·5	3·31	1337·0	Clean arm.
			1292·9	1289·9	1291·0	1294·9	1292·9				
			1287·8	1284·8	1292·9	1294·9	1284·8				
			1284·8	1289·9	1299·1	—	—				

The results have proved that,—

(1.) 86 grains of compressed powder equal about 85 grains of loose powder.
(2.) There is considerable uniformity in velocity in the case of both powders, the compressed being slightly the best.
(3.) The fouling due to 80 rounds had no appreciable effect in either case on the strength or uniformity.

These results are very satisfactory for the compressed and perforated charges.

Boxer cartridges were used throughout, with a solid bullet hardened with $\frac{1}{13}$ of tin, of 466 grains weight. The rifles were fired alternately. The loose powder was "Curtis & Harvey, No. 6." The compressed charges were made, it is believed, of ordinary F. G. powder.

Minute 25,106.

1641. STRENGTH of GUNPOWDER.
2367. PERFORATED and COMPRESSED POWDER.
2560. COMMITTEE on B. L. SMALL ARMS.

3

Captain W. H. Noble, R.A., 6/6/68, submits for record, with reference to *Minute* 24,793, the following abstract giving the results of experiments, which he carried out for the Committee on B. L. small arms, to ascertain the strength and uniformity of perforated and compressed charges of gunpowder in comparison with loose powder when fired from B. L. rifles.

The arm used was the Henry B. L. small bore (0·45 inch) rifle.

The object of the experiment was,—

1. To compare with results on *Minute* 24,793, as subsequent investigation had showed that the compressed charges fired on that occasion were 80 and probably 86 grains, and not 75 and 81, as at first supposed.

2. To compare compressed charges of 80, 82, and 86 grains of F. G. powder with loose charges of 85 grains of Curtis & Harvey, No. 6.

Boxer cartridges were used throughout, with a solid bullet hardened with $\frac{1}{13}$th of tin. The rifles were fired alternately.

Do.	10	82 grs. compressed F. G.	480	1245·9 1266·4	1261·4 1265·4	1258·5 1263·4	1259·5 1255·6	1281·3 1277·3	1263·5	7·31	1305·5
Do.	10	86 grs. compressed F. G.	480	1308·9 1307·9	1303·8 1317·3	1308·9 1293·5	1303·8 1291·4	1290·4 1324·8	1305·1	8·49	1350·2

The results show,—

1. That 86 grains of compressed powder (F. G.) is equal to about 85 grains of loose Curtis & Harvey, No. 6.

2. There is considerable uniformity in the case of both powders, the compressed being the best.

3. With the 480 grain bullet the velocity is very slightly reduced by the extra weight. In fact, with the loose powder there was a higher velocity with the heavier bullet, showing that the increased resistance helped to burn the powder more effectually.

It is suggested that 1 lb. each of 10 different lots of F. G. powder be obtained from P. S. of Stores, and that 50 cartridges (86 grains) of each lot be made, and tested for uniformity.

Captain Noble wishes to point out, as stated in his evidence before the Committee on B. L. Small Arms (questions 1540—1550), that in comparing the velocity given by compressed and perforated charges with that given by loose charges, it is necessary to look to the previous manufacture of the two powders. That is to say, although a perforated and compressed charge of a certain description of powder, A, will give a higher velocity than the same charge of A in a loose state, it by no means follows that the A compressed will give an equal or superior velocity to a charge of B powder in a loose state.

In the present instance a charge of 86 grains of F. G. compressed would probably give a higher velocity than 86 grains F. G. loose, but it does not give as high a velocity as 85 grains of Curtis & Harvey, No. 6, loose. Still F. G. may have advantages for compressing which are not possessed by the other powder.

APPENDIX XIX.

Ordnance Select Committee, Royal Arsenal,
SIR, March 9, 1868.

THE Committee on breech-loading rifles are desirous of making experiments for determining the form and number of grooves and amount of twist most suitable for a military breech-loading rifle of 0·45 inch calibre.

The following elements have been chosen as the best on which to start the inquiry, viz. :—

Calibre		0·45 inch.
Barrel	Length	35 inches.
	Weight not to exceed	4 lbs. 6 ozs.
	Exterior diameter at breech	1·075 inch.
	Exterior diameter at muzzle	0·795 „
Bullet		480 grains.
Powder		85 „

or a quantity of compressed powder which will give equal initial velocity.

As this inquiry has no reference to the best method of closing the breech, it has been decided that all the barrels for trial shall be fitted to Henry breech arrangements, which are now being prepared.

The Committee being anxious to try your rifling in comparison with others, have directed me to inquire if you would favour them with your assistance in the necessary trials, by preparing eight steel barrels in accordance with the above conditions, and rifled in the manner which you consider best to ensure accurate shooting and freedom from fouling.

I am also to inquire upon what terms of repayment you would undertake to assist the Committee in the manner indicated.

From the evidence already received, and from their own experience, the Committee are inclined to prefer a bullet solid at the base, but they would not object to a slight concavity, also they have no objection to the bullet being hardened to any degree which may suit your rifling. The bullet may have cannelures or not; the lubrication must be pure beeswax, but the Committee will leave it to you whether it shall be applied directly to the bullet or on a paper cap, or in the form of a wad behind the bullet, or by any combination of these methods, or otherwise.

The bullets must be secured in the cartridge cases very firmly, and by a method that could be used when manufacturing in large quantities.

The cartridge cases will be made in the Royal Laboratory, and specimens can be supplied to you to govern the dimensions of the chamber, or a gauge

plug can be furnished for the chamber, which will allow for the manufacturing limits of dimensions of the cartridges.

The Committee propose that four of the barrels should be chambered for cartridges made up with ordinary powder, and four for compressed powder cartridges. The former could be completed at once, as the dimensions of the cartridge are well known. The dimensions of the cartridge for compressed powder are not yet determined, but the rifling of the barrels might be proceeded with, and the chambering completed hereafter. Time being of great importance, the Committee propose that all these barrels should be made to screw into one Henry breech arrangement with stock and lock, which will be supplied in the event of your being willing to afford your assistance.

The Committee would be glad to have your opinion as to whether, for these experimental purposes only, the barrels should be of steel or iron, and if the weight given, viz., 4 lbs. 6 ozs., could be reduced with safety.

In conclusion, I am to inquire whether any of the conditions laid down interfere with the development of your system of rifling, and if so, what alterations you would propose.

If you prefer it, the Committee will undertake that the barrels shall be delivered to you bored smooth to 0·45 inch calibre, but unrifled.

The Committee have no objection to the preparation of a larger number of barrels if you should require them for preliminary experiments, and would feel obliged by your including any such number in your estimate of cost, should you feel inclined to send one, and they would also wish for an estimate of the time which must elapse before the barrels can be completed and delivered.

A reply is requested at your earliest convenience.

I have, &c.

War Office,

SIR, 10th March 1868

I HAVE the honour to transmit to you Her Majesty's Commission appointing you and others therein named to be Her Majesty's Commissioners to inquire into the constitution and practice of Courts Martial in the Army, and the present system of punishment for military offences, and to report your opinions in what respects the administration of Criminal Justice in the Army admits of improvement.

I have the honour to be, Sir,
Your most obedient Servant,
JOHN S. PAKINGTON.

Colonel the Right Hon.
John Wilson Patten, M.P.,
&c. &c. &c.
24, Hill Street, Berkeley Square.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith.

To Our right trusty and well-beloved Councillor John Wilson Patten, Esquire, Colonel of the Third Royal Lancashire Militia, one of Our Aides-de-Camp, Chancellor of Our Duchy of Lancaster.

To Our right trusty and well-beloved Councillor, Spencer Compton Cavendish, commonly called Marquis of Hartington.

To Our right trusty and well-beloved Cousin and Councillor Charles Viscount Eversley, Lieutenant-Colonel Commandant in the Hampshire Regiment of Yeomanry Cavalry, one of Our Aides-de-Camp, with the rank of Colonel in the Yeomanry.

To Our right trusty and well-beloved Councillor Lieutenant-General Jonathan Peel.

To Our right trusty and well-beloved Councillor John Robert Mowbray, Esquire, Judge Advocate-General of Our Forces.

To Our right trusty and well-beloved Councillor, Thomas Emerson Headlam, Esquire.

To Our right trusty and well-beloved Councillor Russell Gurney, Esquire, one of Our Counsel, learned in the Law, Recorder of Our City of London.

To Our trusty and well-beloved Sir James Yorke Scarlett, Knight Commander of the most honourable Order of the Bath, Lieutenant General of Our Forces.

To Our trusty and well-beloved Sir Alfred Hastings Horsford, Knight Commander of the most honourable Order of the Bath, Major-General of Our Forces.

To Our trusty and well-beloved Henry Eyre, Esquire, Lieutenant-General of Our Forces.

To Our trusty and well-beloved Samuel Whitbread, Esquire, greeting :

Whereas We have thought it expedient, for divers good causes and considerations, that a Commission should forthwith issue for the purpose of inquiring into the constitution and practice of Courts Martial in Our Army, and the present system of Punishment for Military Offences.

Now know ye, that We, reposing great trust and confidence in your zeal, discretion, and ability, have authorized and appointed, and do by these presents authorize and appoint you the said John Wilson Patten, Spencer Compton Cavendish (commonly called Marquess of Hartington), Charles Viscount Eversley, Jonathan Peel, John Robert Mowbray, Thomas Emerson Headlam, Russell Gurney, Sir James Yorke Scarlett, Sir Alfred Hastings Horsford, Henry Eyre, and Samuel Whitbread, or any three or more of you to be Our Commissioners for making the inquiry aforesaid. And We do hereby authorize and empower you Our said Commissioners, or any three or more of you, to obtain information thereupon by the examination of all persons most competent by reason of their knowledge, habits, or experience, to afford it; and also by calling for all documents, papers, and records which may appear to you, or any three or more of you, calculated to assist your researches, and to promote the formation of a sound judgment on the subject. And We do hereby require and command you, or any three or more of you, to report to Us, under your hands and seals, with all convenient speed, your opinions in what respects the administration of Criminal Justice in the Army admits of improvement, either as regards the constitution or the practice of Courts Martial, and what changes or modifications it may be desirable to make in the punishments now applicable to offences committed by the soldier without danger to the paramount consideration of maintaining discipline and effectually repressing crime in the ranks of the British Army throughout all the various contingencies of military service to which Our troops are necessarily liable. And We will and command, and by these presents ordain that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any three or more of you, may from time to time proceed in the execution thereof although the same be not continued from time to time by adjournment. And we do hereby command all and singular Our Justices of the Peace, Sheriffs, Mayors, Bailiffs, Constables, Officers, Ministers, and all other Our loving subjects whatsoever, as well within liberties as without, that they be assistant to you and each of you in the execution of these presents. And for your assistance in the due execution of these presents We have made choice of Our trusty and well-beloved John Lloyd Wharton, Esquire, barrister-at-law, to be Secretary to this Our Commission, and to attend you, whose service and assistance We require you to use from time to time as occasion shall require. In witness whereof We have caused these Our letters to be made patent.

Witness Ourself at the Court at Saint James's the tenth day of March in the thirty-first year of Our Reign.

By Her Majesty's Command.

JOHN S. PAKINGTON.

40084
3

War Office,
30th March 1868.

Sir,

In reference to my communication of the 10th instant, I have the honour to transmit to you Her Majesty's further Warrant, appointing the Honourable J. C. W. Vivian, M.P., and Colonel S. N. Lowder, C.B., Deputy Adjutant-General, Royal Marines, to be additional members of the Royal Commission on Courts Martial.

I have the honour to be, Sir,
Your most obedient servant,
JOHN S. PAKINGTON.

Colonel
The Right Honourable J. W. Patten, M.P.,
24, Hill Street, Berkeley Square.

Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, to

Our trusty and well beloved John Cranch Walker Vivian, Esquire, commonly called the Honourable John Cranch Walker Vivian;

Our trusty and well-beloved Samuel Netterville Lowder, Companion of the most honourable Order of the Bath, Colonel in Our Army, one of Our Aides-de-Camp, Deputy Adjutant General, Royal Marines, greeting,

Whereas We did, by Warrant under Our Royal Sign Manual, bearing date the Tenth instant, authorize and appoint Our right trusty and well-beloved Councillor John Wilson Patten, Esquire, Colonel of the Third Royal Lancashire Militia, one of Our Aides-de-Camp, Chancellor of Our Duchy of Lancaster, together with the several noblemen and gentlemen named in the said Warrant, or any three or more of them, to be Our Commissioners to inquire into the constitution and practice of Courts-Martial in Our Army, and the present system of Punishment for Military Offences.

Now know ye, that We, reposing great trust and confidence in your zeal, discretion, and ability, have authorized and appointed, and do by these presents authorize and appoint you, the said John Cranch Walker Vivian, commonly called the Honourable John Cranch Walker Vivian, and Samuel Netterville Lowder, to be Our Commissioners for the purposes aforesaid, in addition to, and together with, the Commissioners whom We have already appointed by the above-mentioned Royal Warrant.

Given at Our Court at Saint James's, this Thirtieth day of March One thousand eight hundred and sixty-eight, in the Thirty-first year of Our reign.

J. S. PAKINGTON.

To the Honourable John C. W. Vivian and Colonel S. N. Lowder, C.B., additional Commissioners for inquiring into the constitution and practice of Courts-Martial in Our Army, and the present system of Punishment for Military Offences.

FIRST REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We Your Majesty's Commissioners, appointed by Warrant under Your Majesty's Sign Manual bearing date the 10th day of March 1868, to inquire into the constitution and practice of courts-martial and the present system of punishments for military offences, beg to submit to Your Majesty this our First Report.

Several voluminous documents relating to courts-martial have been laid before us at so late a period that we ask permission to delay for a short time our final Report; but inasmuch as some of our suggestions respecting military punishments, if approved of by Your Majesty, should in our opinion be acted upon without loss of time, we venture to submit them forthwith.

The abolition of flogging in the army by a recent Act of the legislature renders it all the more important that the remaining punishments in use in the service should at this time receive careful attention.

Passing over the consideration of the punishment of death, one happily of extremely rare occurrence in Your Majesty's service, the punishment next in order of severity is that of Penal Servitude.

The arrangements for carrying out a sentence of Penal Servitude are under the superintendence of a Board of Directors specially appointed for that purpose, and the only suggestion we have to make in connexion with it is, that as the shortest period of penal servitude to which a man can be sentenced is now five years, recourse should be had to this punishment for those serious crimes only which also involve dismissal from the army.

We are of opinion that it cannot in any case be desirable to retain in Your Majesty's service a man who has undergone such a term of penal servitude.

Next in order of severity comes imprisonment, either in military or civil prisons, for terms varying in extent but not exceeding two years, and as this is the most severe punishment which can be inflicted upon soldiers who are to be retained in the service, we have felt it right to examine into the arrangements which exist for carrying it into effect.

In order to institute an exact comparison between the systems of imprisonment as carried out in the military and civil prisons respectively, we inspected first a well conducted civil prison, and afterwards we visited some of the military prisons.

We are strongly of opinion that imprisonment as carried out in the military prisons is not nearly so severe as in the civil prisons, whilst in some of the former it is much more injurious in its moral effects upon many who are not hardened offenders.

One of the causes of this difference is to be found in the structural arrangements of the two classes of prisons. In the civil prisons the system is one of strict separation of prisoners; in some of the military prisons, on the contrary, the prisoners are associated.

In the civil prison which we inspected a separate cell is provided for every prisoner, in which he works, has his meals, and sleeps, and when he leaves this cell for exercise in the open air it is so arranged that he cannot hold communication with his fellow prisoners. Moreover, as required by the Prison Discipline Act of 1865, a daily task of real hard labour is enforced upon every able-bodied prisoner who is sentenced to that punishment.

In the Fort Clarence military prison there are only 21 cells, whilst the complement of prisoners is 106; most of the prisoners sleep in dormitories each containing several beds, no warder is in the rooms, and it is impossible therefore to place any effectual check upon communication between the prisoners at night.

The only form of hard labour in use is the "shot drill," at which the prisoners work in association for two periods of $1\frac{1}{2}$ hour daily; it is to be observed that this form of punishment is entirely unremunerative, it does not admit of being graduated according to a prisoner's strength, and many of the prisoners are altogether exempted from it.

The remaining punishment is principally a light form of oakum picking, carried on also in association.

The prisoners also have their meals in association, where again it is hardly possible to prevent communication between them.

It needs no argument to show how injurious to many prisoners must be this system of association, nor how much it detracts from the severity of the punishment.

The advantages attending the strict separation of prisoners are well ascertained, and universally admitted, and after long experience and careful inquiry the system has been applied by the legislature to all the civil prisons in England.

We came without hesitation to the conclusion that the severity of the punishment in military prisons is not to be compared with that in the civil gaol which we inspected.

Many of these remarks apply with equal force to the prison at Aldershot, which as a prison structure is even worse than Fort Clarence, and although in the military prison in Southwark, formerly known as the Queen's Bench Prison, there is a separate cell for each prisoner, the only form of hard labour in use is the shot drill, from which a large proportion of the prisoners are exempt, and there are no means of enforcing a task of hard labour in the cell. Moreover the cells appeared to be so constructed as to afford the maximum of inconvenience as regards effective superintendence and the minimum of punishment.

In making these remarks we feel it our duty to say that we do not impute the slightest blame to the officers of these military prisons. They seemed to us to be doing their best with the means at their disposal and under the regulations laid down for their guidance.

We have not had an opportunity of inspecting other military prisons, but we beg to call attention to the official reports of the Inspector-General of Military Prisons, in which also a confirmation will be found of nearly all that we have said of these prisons.

We consider that this condition of the military prisons calls for a prompt and decided change.

We recommend that a central military prison should be established sufficiently large to contain the prisoners from all districts within a convenient distance, that this prison should be constructed for, and worked upon the separate system as established by law for the civil prisons, and that the regulations as to "hard labour" laid down in the Prison Discipline Act, 1865, should be enforced.

We think that the object to be attained will amply justify the expenditure on this head, and we may observe that some considerable saving could be effected in the reduction of the staff of prison officers.

We are also of opinion that it would be advantageous that the military prisons should be placed directly under the superintendence of the Board of Directors of Government Prisons. The chairman of this board is at present the Inspector-General of Military Prisons.

Such a course would secure uniformity of discipline and treatment in all military prisons, and would bring to bear upon their management the wide experience of those whose whole time is given up to the administration of prison affairs. But as a considerable time would necessarily elapse before such a central prison could be established, and in order to provide a remedy where it is most urgently required, we recommend that those military prisons where there is not separate cell accommodation for the prisoners, should be closed so soon as the Govenment can enter into contracts with the authorities of any well regulated civil prisons for the reception of the requisite number of military prisoners, due regard being had to the situation of such civil prison.

In the remaining military prisons we recommend that the regulations as to separation and hard labour contained in the Prison Discipline Act, 1865, should as far as practicable be applied.

When our recommendation shall be completely carried out, it will follow that the term "solitary confinement" need no longer form part of any sentence, as every prisoner will be kept in strict separation, which is practically the only form of solitary confinement known in the prisons of this country, except for prison offences.

We think that confinement in dark cells should be kept as a punishment for offences committed in prison.

Instead of sending a military escort to convey the soldier to prison, a warder should be sent to convey him, in plain clothes.

We would also suggest that as a rule hard labour should form a part of the sentence of every soldier sent to a military prison. If the prisoner is not physically fit to undergo hard labour it can hardly be desirable to retain him in the army, and whenever recourse is had to the punishment of imprisonment it should be made as severe and deterrent as a due regard for the health of the prisoner and the laws of humanity will permit.

Punishments for Drunkenness.

All punishments hitherto in force for repressing drunkenness have proved ineffectual for their object.

We do not assert that drunkenness is on the increase in the army, but it still forms a lamentable and disgraceful blot in the military character, and is connected with a vast majority of crimes subjected to trial by court-martial.

If this crime could be eradicated or even materially checked, it cannot be doubted that the benefit would be felt not only in the improved discipline and efficiency of the army, but in the increased vigour, the comfort, and happiness of the troops.

As one amongst many illustrations of its prevalence and of its effects, we would call attention to a report which will be given in the appendix to our final report, as to the drunkenness which was punished in a garrison of 4,676 men quartered at Malta, in the space of one year, from which it appears that there were 458 trials for habitual drunkenness unaccompanied by any other offence, and that the total number of days lost to the service by imprisonment for drunkenness under sentence of court-martial in the same period of time was 16,099. We may also add that it is shown by the above report that the number of trials for habitual drunkenness in the whole army for the year 1866 was 9,736.

We observe from a correspondence which has been laid before us, and which will be also given in the appendix, that this subject has already attracted the attention of His Royal Highness the Commander-in-Chief, that it has been submitted by His Royal Highness to a Committee of officers, and that after collecting the opinions of several high authorities this committee has recommended a complete alteration in the punishment of this crime.

We also have made the punishment for drunkenness one of the main objects of our inquiry. We have taken the evidence of men of all ranks, officers, non-commissioned officers, and privates, and we believe that the opinion is almost unanimous, first, as to the inefficacy of the present system for the repression of this crime; and, secondly, as to the nature of the punishment which should be substituted, at least by way of experiment, for that now in force.

We agree with the committee appointed by His Royal Highness that these constant trials and frequent imprisonments have not only been ineffectual for repressing drunkenness, but that they tend to demoralize the men who are subjected to them, have a natural tendency to diminish that dread of prison which is so essential to the maintenance of discipline, while a large per-centage of the services of the army is hereby lost, and increased duty thrown upon well behaved men; and we concur in the alteration of Articles 76, 77, and 78, as set forth in that report.

It will be observed that a punishment by fine has been added by these amended articles, and that the trial for habitual drunkenness for the fourth time is retained only until it is ascertained whether the amended system is working satisfactorily.

That committee consider it essential to the success of any system of fines that the sums derived from them should be formed into a separate fund, and with the concurrence of the Secretary of State for War should be applied towards increasing the amount voted for rewards to well conducted men, or to other objects for the general improvement of the soldiers' condition. We concur with the committee in this view, and we believe that such an application of fines would tend very materially to secure the general concurrence of the army in the alteration. We may add, in support of this view, that it is simply the enforcement in the army of a provision of the civil law under which every one of Your Majesty's subjects is already liable to be fined for the offence of drunkenness.

Punishment of Non-commissioned Officers.

It is generally understood that under the provisions of the present Mutiny Act, and the usages of the army, no non-commissioned officer can be subjected to any punishment by court-martial without being reduced to the ranks, and this view has almost invariably been acted upon. The object of such a practice has been to maintain that respect on the part of the soldier for the non-commissioned officer which is so essential for the maintenance of discipline, and which would be materially decreased by a knowledge that the non-commissioned officer had himself been subjected to punishment for crime.

There is no doubt that the reduction of a non-commissioned officer to the ranks involves a much greater amount of punishment than can be inflicted for equal crimes on any other rank. It includes the loss of some of his advantages derived from previous good conduct, and renders it impossible for him to gain his gratuity and medal on discharge.

We may add that in the regulations of foreign armies, and especially in that of Prussia where more than ordinary importance is attached to the character and influence of non-commissioned officers, there is a scale of punishment which applies to them.

It will be seen by the evidence that non-commissioned officers consider this a serious grievance, and several officers of great experience are of opinion that the rule may be to a certain degree relaxed without prejudice to the service.

Without at all under estimating the very great importance of maintaining the high character at present enjoyed by the non-commissioned officers of Your Majesty's Forces, and the danger of diminishing the influence which that character gives them, we believe that some alteration in the application of the present regulations may be adopted with advantage, and we recommend that in cases where a non-commissioned officer has been reduced to the ranks, and subsequently restored, he should be enabled to regain any former distinction he possessed by good service, the length of which should be determined by regulation.

We cannot conclude our Report on Military Punishments without expressing our opinion that greater facility should be given for the discharge of soldiers who, from repeated convictions, afford grounds for believing that they are beyond the power of reformation.

The evidence given before us is conclusive that the continuance of such men in Your Majesty's service tends to demoralize the young soldier, and is otherwise seriously prejudicial to it.

Their discharge should be invariably preceded by severe punishment, and care taken that they have not the means of re-entering the service.

SECOND REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

Your Majesty's Commissioners appointed to inquire into the constitution and practice of Courts-Martial and the present system of military punishments, submit to Your Majesty their Second Report, having more especial reference to Courts-Martial.

The necessity for some exceptional tribunal better adapted to the exigencies of military service than the civil courts appears to have been recognised from very ancient times, in all nations, and under all forms of government.

In Your Majesty's dominions, as in France and other European nations, and in the United States of America, they form a portion of the national law equally with the civil courts: indeed, it may be said that the Mutiny Act, is by the very limited terms of its duration and frequency of its renewal, more truly and immediately framed by the people than any other of the existing statutes of the realm.

An American writer, whose work has been furnished to us by the Government of the United States, in treating of the necessity of courts-martial in that country, where they are regulated, as in Great Britain, by Articles of War and by general regulations and the orders of the President, describes them as tribunals existing by the same authority as any other courts, and the law military, as administered by them, as being as valid as any other law.

We have pleasure in adding the expression of our belief, founded on the evidence of men of all ranks in Your Majesty's forces, that although there may be defects requiring correction, to which we shall hereafter advert, these Courts have the confidence of the army, and they are satisfactorily spoken of even by those who have been subject to their jurisdiction.

It may be desirable in the first instance to give a short description of these Courts.

There are several kinds of courts-martial varying to some extent in their constitution and practice, according to the nature of the crimes with which they have to deal, and to the local and other circumstances under which they may be called upon to act.

For our present purpose it is necessary to specify only the three principal courts, the General, the District, and the Regimental.

A general court-martial consisted, up to the year 1868, of 13 commissioned officers if held in the United Kingdom or the British Isles, and seven or five, according to the locality, if held elsewhere. The Mutiny Act of 1868 reduced the number of officers in the United Kingdom or the British Isles to nine, each of whom must be of at least three years' standing.

A general court is convened under your Majesty's authority by the General Commanding-in-Chief, or by a General Officer in command at home or abroad empowered by warrant under sign manual. The president of it is appointed by the convening officer, but to secure impartiality the other officers of the court are called upon to serve, not by selection, but by roster from various regiments. It has the same power to try crimes, however grave, which is possessed by Your Majesty's ordinary criminal courts, and with the exception of corporal punishment, can award sentences equally severe, including that of death.

Every general court is attended by a Deputy Judge Advocate, appointed by deputation, if in England, from the Judge Advocate-General; if abroad, by warrant from the convening officer.

The Deputy Judge Advocate is not a member of the court, but acts as its legal adviser in all matters which come before it; and his duties, which up to a very recent period were of a rather undefined character, are now strictly laid down in Your Majesty's Regulations, and consist chiefly in securing a strict administration of military law as regards the court, and maintaining for the prisoner every privilege which the law allows him in the conduct of the trial. One of his duties, under the new regulations, is that of summing up the evidence.

In every case which comes before a general court a prosecutor is appointed by the convening officer, whose duties are defined in Your Majesty's Regulations.

Procedure of trial in this court resembles in some respects a trial before one of Your Majesty's ordinary tribunals. There are, however, some essential differences.

(1.) Questions to witnesses, whether by the prosecutor or the prisoner, are usually reduced to writing and submitted to the president, who, if they are sanctioned by the Deputy Judge Advocate, puts them, or causes them to be put by the latter, to the witness.

(2.) The questions and answers and all the proceedings of the court are recorded by the Deputy Judge Advocate.

(3.) Legal assistance is permitted to either prosecutor or prisoner, but no civilian is allowed to address the court. The prosecuting officer and the prisoner may, however, address the court; and in the more important cases these addresses are usually written.

(4.) The summing up and statement of the law are made by the Deputy Judge Advocate, and usually in writing.

(5.) The court itself gives its decision in every case, without reference to a jury.

(6.) The court does not immediately disclose the finding or sentence. In Great Britain and certain commands abroad a record of the proceedings is transmitted to the Judge Advocate-General, who submits it for Your Majesty's consideration and decision thereupon. In other commands abroad the proceedings are transmitted to the General Officer, who is empowered by warrant to confirm the same.

(7.) The confirming authority may approve and confirm the proceedings; he may remit the whole or any part of the sentence; may, in some special cases provided for by the Mutiny Act, commute the sentence; may decline to confirm the proceedings, and may order the court to re-assemble to re-consider their proceedings, and revise their decision. Such re-assembling can, however, only take place once, and additional evidence is in no case allowed to be given. No proceedings are valid until they are confirmed; when confirmed, they are promulgated and the sentence is carried into effect.

A district court-martial differs from a general one in the number and standing of its members, in not being attended by a Deputy Judge Advocate, and in having no power to try a commissioned officer or to pass a sentence of death or of penal servitude. The number of officers required to constitute a district court is seven. It is convened by the general commanding a district, or, under his authority, by any officer of sufficient rank.

A regimental court is convened by the commanding officer of a regiment exclusively for the trial of crimes committed within the regiment. It consists of five officers, unless it is found impracticable to assemble that number, when three shall be sufficient. With a view of strengthening the court, it is provided by the regulations that officers on their entrance into the army should attend the proceedings of all courts-martial that may be held at the station where they are quartered for at least six months from the date of their joining.

All the proceedings are conducted by the court itself, without the assistance of a prosecutor or a Deputy Judge Advocate.

There is another court termed a Court of Inquiry, which, however, cannot in any way be considered as a judicial body. It is employed at the discretion of a commanding officer, whether of a district or regiment, to collect and record information, or to give an opinion upon a proposed question. It has no power to administer an oath, or to compel the attendance of witnesses, and may be considered in the light of a council to the commanding officer, with a view of enabling him the better to discharge his duty to Your Majesty, and to facilitate to Your Majesty the exercise of your Prerogative in matters relating to the army. It is sometimes used by a commanding officer to ascertain whether there are grounds for submitting a case to a court-martial; and it is only in this last respect, if at all, that it can come within the scope of our inquiry.

The law of courts-martial is derived from the Mutiny Act, the Articles of War, and Your Majesty's Regulations; and when they are silent, by the custom of war, by which expression must be understood the customs of the British Army.

The Articles of War are framed by Your Majesty's authority, and are sanctioned by the Legislature under the Mutiny Act. The Regulations of the army are issued also by Your Majesty's authority; and the law so constituted is administered under an oath taken by all the members of the court, of which the following is an extract:—

"You shall duly administer justice according to the rules and articles for the better "government of Her Majesty's forces, and according to an Act now in force for the "punishment of mutiny and desertion and other crimes therein mentioned, without par- "tiality, favour, or affection; and if any doubt shall arise which is not explained by the

" said Articles or Act, then according to your conscience, the best of your under-
" standing, and the custom of war in like cases."

The number of courts-martial held in three years were:—

——	1865.	1866.	1867.
General - - -	155	20	103
District - - -	7,020	7,016	6,651
Regimental - - -	14,437	16,800	16,781
Total - -	21,612	23,936	23,535

The charges tried by the above courts are as follows:—

Various suggestions have been made to us affecting the constitution and procedure of courts-martial by experienced military officers as well as by distinguished members of the legal profession, who have been officially or professionally engaged in them.

We would first call attention to the remarks made on the nature of the military law which has to be administered in these courts.

The evidence before us shows that military law as laid down in the Acts of Parliament and the Articles of War is in a complicated state, and that not only in the courts themselves, but even in the highest military departments, there is often much difficulty in arriving at a just conclusion, owing to the different sources to which reference has to be made.

We would especially call attention to the evidence of His Royal Highness the Field Marshal Commanding-in-Chief. His Royal Highness expresses an opinion that the frequent re-assembling of courts-martial for the purpose of revising their proceedings, to which we shall hereafter advert, is attributable mainly to the difficulty which the courts often experience in ascertaining the meaning of the wording of the Mutiny Act and Articles of War. His Royal Highness strongly recommends that both should be revised, with a view to their being rendered more clear and simple.

The Right Hon. Thomas E. Headlam, formerly a Judge Advocate-General, states that the Mutiny Act, as it at present exists, is very confused and unduly long, and that there are some provisions in it which are unsuitable and unnecessary, and some which are obsolete. He recommends that a permanent military code should be enacted, and that only that part of the Mutiny Act which authorizes the number of men should be submitted annually to Parliament; and that the military code should be made to resemble the Naval Discipline Act.

The Right Hon. J. R. Mowbray, also formerly a Judge Advocate-General, gives his opinion that military law is in a very "confused," "uncertain," and "conflicting state." He says that "in addition to the Mutiny Act, seven other Acts of Parliament, and "the Queen's and War Office Regulations, he had often to refer to Royal Warrants, with "reference to pay and promotion;" and he adds, that military law being in a condition "which is perplexing to lawyers, he is afraid it must be unintelligible to soldiers;" and both he and Mr. Headlam agree in recommending that the Mutiny Act should be very carefully revised and re-written, and made as clear as possible.

We have received other evidence to the same purport, and we strongly recommend that the simplification of military law as suggested should receive the immediate attention of Your Majesty's Government.

It is obvious that laws affecting the honour, the liberties, and the lives of Your Majesty's subjects should be as clear and simple as circumstances will allow, and it is equally obvious that the frequent re-assembling of courts-martial for revision, referred to by His Royal Highness, must tend to diminish the respect with which they ought to be regarded by the British army.

We believe that the task of consolidating the law with the above object will be best performed on the responsibility of Your Majesty's Government.

It also appears to be very desirable that some kind of text book on military law and the laws of evidence should be prepared in a clear and concise form for the special convenience and instruction of the officers of the army, and for the use of courts-martial; and we think a suggestion made by Mr. Headlam, to make known to the army, from time to time, any important decisions of the Judge Advocate on military law worthy of consideration.

In the course of the evidence many comments have been made on the present constitution and practice of courts-martial. Opinions have been expressed that these courts are inadequate, as at present constituted, to deal with difficult questions of law which frequently arise in the course of military trials.

Mr. Vernon Harcourt, a distinguished member of the Bar, while he advocates the maintenance of courts-martial under military control, and admits that justice must be administered by them in a somewhat ruder manner than in the courts of Westminster Hall, complains of the want of a sufficient knowledge in members of courts-martial of the laws of evidence, and recommends that this point should be more attended to.

Two modes have been proposed for remedying these defects, the one that the president of every general court-martial should be a barrister, the other, that more attention should be paid to the education of officers in military law, and that the office of Deputy Judge Advocate should invariably be filled by a barrister or by an officer on whose advice in legal practice, and especially on points of legal evidence, the court could at all times confidently rely.

We adopt the latter view, and we think that inasmuch as courts-martial are tribunals for the trial of issues, the determination of which must to a great extent depend upon the custom and usages of war and of military service, the president and all the members of the court should have a practical knowledge and experience in those usages, and that it is therefore essential to maintain strictly the military character of the court.

At the same time we consider it to be a matter of the first importance in tribunals before which the lives and liberties, and the honour of Your Majesty's subjects are sometimes at stake, that no means should be neglected of securing to those who come under their jurisdiction, as far as may be practicable, the protection afforded to a prisoner on his trial before one of the ordinary courts of law.

We recommend that courts-martial should in the main be constituted as at present, and that the duties of Deputy Judge Advocate should continue to be discharged as laid down in Your Majesty's Regulations and the Articles of War, but that in all appointments to that office a competent knowledge of the laws of evidence, and of the procedure in the ordinary criminal courts, should be considered an indispensable qualification.

We also recommend that every subaltern officer, before sitting as a member of a court-martial, and previous to each step of promotion, should pass an examination before a board, of which a Deputy Judge Advocate, or some one deputed by the Judge Advocate-General, should be a member, and conduct that part of the examination which relates to the duties of a member of a court-martial. We would especially call attention to the answer to question 5151 in Major-General Simmons's evidence, in which he refers to a system which he carried on, apparently with great advantage, among a large number of young officers in the Engineer department at Chatham.

We believe that a simplification of the law as above suggested, and a strict enforcement of these recommendations, would materially tend to the more satisfactory working of these courts.

Amongst the crimes which have to be dealt with by courts-martial is that of embezzlement. It is an offence not necessarily of a military character, and the trial often involves an examination into accounts of a complicated nature. We recommend that whenever it is practicable, cases of embezzlement of more than common importance be submitted to an ordinary criminal court, as having more experience in dealing with such charges, and greater facilities for thoroughly investigating them.

The present rule of examining witnesses in general courts-martial which requires that questions shall be submitted in writing to the president of the court, previous to being put to the witness, has been much animadverted upon. It is contended that this practice causes frequent and inconvenient delay, and often seriously increases the expense of the trial. On the other hand, it is held to be both a means of protection to the court itself, and a security to the prisoner, that he may not be prejudiced by a question not bearing directly on the case. It is clearly the duty of the president and Judge Advocate to protect the prisoner from any improper question, and we recommend that wherever the services of a sworn shorthand writer can be conveniently obtained, and a full and accurate record of the proceedings thereby secured, the examination be conducted *vivâ voce* as in our ordinary courts.

By the present Articles of War a prisoner under trial before a general court-martial is not entitled as of right to a list of the witnesses to be brought against him. We think that this right should be conceded to him, and a list of the witnesses, together with the charges, should be furnished to him as a matter of right a reasonable time previous to the trial, and that he should also have reasonable notice of any additional witnesses whom in the course of the proceedings it may be found desirable to adduce.

The confirmation and revision of courts-martial have constituted important points in our inquiry. We have already remarked that the confirming authority may approve and confirm the proceedings, or order the court to re-assemble for the purpose of reconsidering their proceedings, and revising their decision.

Objections have been made to the exercise of this power, on the ground that it is contrary to the spirit of English criminal law, more especially when exercised with the object of obtaining a revision of the finding of the court, by which the guilt or innocence of the accused is decided. Much, it is said, depends on the manner in which a witness gives his evidence, with which the confirming authority is necessarily unacquainted, his knowledge of the case being derived from the written proceedings of the court; and for this and other reasons it is urged that at least the decision of the guilt or innocence of a prisoner should be left exclusively with those who have the opportunity of witnessing all the circumstances of the trial.

We find that in 375 cases in which during the year 1867 courts were re-assembled

for the revision of sentences, only twice were findings of conviction reversed, and in only 48 cases was there any mitigation of punishment.

We think that, while it is clearly undesirable that a court should be re-assembled with the view either of revising a finding of acquittal or of increasing the punishment, it would be far better in the few cases in which a confirming officer thinks it right that a finding of guilty should be reversed or the sentence should be mitigated, that he should act on his own responsibility.

The practice of re-assembling the court is often attended with inconvenience and sometimes with hardship to the prisoner, and this latter is especially felt in districts remote from head-quarters, where the accused, notwithstanding his acquittal, must necessarily be remitted back to prison, and kept there until the finding has been dealt with by the confirming authority. Instances of this were brought under our notice, and our remark especially applies to Your Majesty's Indian dominions, where the courts are often held at great distances from the quarters of the confirming officer, and much time is occupied in obtaining his decision.

It remains only to consider the cases when the sentence passed may be contrary to law, and the mistake cannot be corrected by the confirming officer, and where from the peculiar circumstances the sentence awarded cannot properly be carried out. These instances are so very rare that we have come to the conclusion that it is not necessary in any case to retain the practice of re-assembling the court, but that after the finding of the verdict and the declaration of the sentence, the court should be absolutely discharged from any further consideration of the case.

We think that whenever the finding of any court-martial is one of "not guilty" it should be announced in open court, and the prisoner immediately discharged; when of "guilty," the verdict should also be announced in open court, and the sentence in this manner declared, and that thereupon the prisoner should be detained in custody, but the sentence should not be further carried out until the legality and propriety of the verdict and sentence have been examined by the proper authority.

Ample statutory powers should also be vested in the confirming authority to commute sentences of punishment that are open to objection, for some punishment not greater in degree, and to make such remarks on the proceedings of the court as he may think fit.

Many of the remarks, and especially those relating to revision, which we have submitted with respect to general courts-martial, apply equally to district and regimental courts.

The crimes submitted for trial before district courts are generally of a less serious character than those disposed of by general courts, but it sometimes happens that they involve difficult questions of law, and the presence of a Deputy Judge Advocate, not now required, would, under such circumstances, be of advantage. This advantage may we think, be sufficiently obtained by intrusting to the convening officer, either at his own discretion, or on the application of the prosecutor or the prisoner, the power of calling for the assistance of a Deputy Judge Advocate in cases of more than common difficulty; and with this object we recommend that the number of Deputy Judge Advocates should be increased.

It will be seen on reference to the returns which accompany this Report how very large a proportion of military crimes are tried before regimental courts. In the years 1865, 1866, and 1867 they constituted about two-thirds of the cases submitted for trial. They are generally of the simplest kind as regards proof, and a majority of them might be safely dealt with under the powers intrusted to the summary jurisdiction of a commanding officer.

It is a question whether the frequency of regimental courts-martial does not tend to diminish in the mind of the soldier that dread of them which ought to exist if they are to have their proper weight in the maintenance of discipline and the prevention of crime, and it has been submitted for our consideration whether the powers of commanding officers might not be advantageously increased, so as to lessen the number of trials by these courts. Some of the evidence, indeed, is in favour of abolishing regimental courts altogether. We are not prepared to recommend the latter course, but we concur in the view that the jurisdiction of the commanding officer may be safely extended, and we would suggest that his power of sentencing to imprisonment be increased from 7 to 21 days. We would restrict the convening of regimental courts-martial to cases where a district court-martial cannot conveniently be assembled, and we recommend that a regimental court should be composed of officers of not less than three years standing. We also recommend that a record of the proceedings be forwarded to the officer commanding the district.

The above comprise all the suggestions which we venture to submit to Your Majesty with respect to this branch of the inquiry intrusted to us.

Our object in the changes which we have recommended has been rather to strengthen than alter a system which we have every reason to believe is working beneficially, and under which justice is administered with impartiality in Your Majesty's army.

Before closing our remarks we think it right to revert to a portion of our former report which had exclusive reference to military punishments. Since we had the honour of submitting it, we have had opportunities of examining voluminous returns furnished to us from the Horse Guards.

They contain a detailed account of the courts-martial, the crimes, and the punishments inflicted by courts-martial in every branch of the military service during the years 1865, 66, and 67.

An examination of these returns has enabled us to obtain a more correct knowledge of the nature, extent, and progress of military crime than we before possessed, and we regret to add that the result has not been altogether satisfactory.

In crime generally, with few exceptions, there appears to have been a tendency in the three years to which the returns apply, to a decrease, but an increase has taken place in the trials for drunkenness.

In 1865 there were tried 6,853 charges of habitual drunkenness; there were also in the same year 1,803 charges of drunkenness on duty. In 1866 there were 9,504 of the former, and 1,353 of the latter; in 1867 there were 9,353 of the former, and 1,470 of the latter.

The combined charges involving drunkenness were 1865, 8,656; 1866, 10,857; 1867, 10,823.

It ought, however, to be remembered that since the year 1866 the charge for habitual drunkenness was made imperative on the commission of the fourth offence.

These returns afford the strongest corroboration of the evidence given before us of the inadequacy of the former mode of punishment to repress this crime, and strengthen our recommendation, which is now being acted upon, that an experiment should be made of a system of fines as advocated by men of all ranks in Your Majesty's army.

It will be seen from the following return that in the trials for insubordination there has latterly been an increase.

Years.	No. of Men tried for Insubordination.	Average Strength during the Year.	No. of Men tried per 1,000.
1865	1,272	198·048	6·4
1866	1,173	190·919	6·1
1867	1,149	189·781	6·0
1868*	1,397	186·508	7·4

* The returns of six regiments for 1868 have not yet been received.

In some of our military prisons the punishment as now inflicted is, in our opinion, quite inadequate in its nature or its severity to the repression of the crime of insubordination, and we again strongly recommend that some central military prison should, with the least possible delay, be provided, in which stricter discipline can be exercised than is possible in some of the present places of confinement, and that in the meantime arrangements should be made with the authorities of civil prisons for the reception of the requisite number of military prisoners, care being taken to separate them as far as possible from the other prisoners. We would also suggest that prisoners awaiting trial for this crime should be confined, where it is possible, in separate cells, instead of in the prisoners' guard room.

Public attention has lately been much directed to the custom of marking prisoners discharged with ignominy from the military service, the letters B. C. indicating Bad Character, and D. Desertion.

The frequent use of the term "branding," has led to an erroneous impression that marking is effected in some painful and cruel manner.

The mode of marking is, in truth, attended with so little pain, that in Your Majesty's service, both military and naval, it is a common occurrence for men to mark

themselves in a similar manner for the purpose of recording events in their past lives, the attachments which they have formed, or the ships and regiments to which they belong.

The real object of marking is not the punishment of the offender but the protection of the public, who are frequently defrauded of the bounty paid on the re-enlistment of discharged men, who by their general bad conduct have brought disgrace on themselves and the profession to which they belong, and are no longer likely to be of any advantage to the public service.

But it is the system of tempting recruits by bounties without any previous inquiry into their character which is the chief cause of fraudulent re-enlistment, and if, as we have reason to hope, measures can be taken to reform this system, all motive for continuing a practice, which nothing but necessity can justify, will cease to exist.

The returns relating to the punishment of imprisonment have had our serious consideration. We shall best show their nature and tendency by a short analysis. The following is the number of days' imprisonment inflicted in each of three years in that portion of Your Majesty's forces from which the returns have been compiled:—

Years.	No. of Men.	Days' Imprisoment.
1865	198,048	1,144,745
1866	190,919	1,121,757
1867	189,781	1,134,058

It will be observed on reference to the returns, which are given fully in the Appendix, that the number of days' imprisonment inflicted in each regiment and in each branch of the service differs materially; this arises in part from the different system of discipline carried on in each, but may, we believe, be attributed in great measure to a variety of local and other circumstances, but especially to the greater or less degree of temptation to crime which exists in the various military stations at home and abroad. It is obvious that so large an amount of imprisonment as is here shown cannot be enforced without a serious loss of service and diminution of the efficiency of the British army, and independently of the immediate object of our inquiry, the repression of crime, this is of itself of sufficient importance to demand an earnest consideration whether means may not be found to, at least, mitigate so serious a defect. We believe that this will have been accomplished to a considerable extent by attention to the recommendation in our former Report, already acted upon, namely, that fines be substituted for imprisonment for the crime of drunkenness. A further diminution might be effected by a general alteration of the scale of imprisonment. When the change we have recommended for the military prisons is fully carried out, and stricter discipline enforced, the periods of imprisonment under each sentence may be materially and beneficially shortened.

We have now considered the two subjects more immediately referred to us.

In dealing with courts-martial, whilst aiming at the complete independence of the tribunal, we have endeavoured to secure in its members a better acquaintance with military law, and to increase the sense of responsibility under which they act; and we believe that our recommendations, if carried into effect, will strengthen the belief in the impartiality of trial by courts-martial, and in the justice both of their finding and sentence.

In the punishments, we have endeavoured to strengthen what is effective and deterrent, and to abolish what is useless or demoralising. Whilst keeping in mind the paramount necessity of maintaining discipline in the army, we cannot overlook the fact that discipline could be best maintained should dismissal from Your Majesty's service come to be universally regarded by the soldiers as a severe punishment.

This cannot be brought about by any change in the system of courts-martial or by any modification in the punishments in use in the army, but we believe our recommendations tend in that direction.

The following is a summary of the chief alterations which we have recommended:—

1st. That the Mutiny Act and Articles of War should be carefully redrawn.

2nd. That a text book on military law be prepared for the convenience and instruction of officers, and for the use of courts-martial.

3rd. That a stricter examination of officers in military law be enforced, such examination to be conducted before a board of officers by a Deputy Judge Advocate, or some one deputed by the Judge Advocate-General.

4th. That the convening officer of a district court-martial be enabled either at his own discretion or on the application of the prosecutor or prisoner to require the attendance of a Deputy Judge Advocate.

5th. That for this object the present number of Deputy Judge Advocates be increased.

6th. That with the view to reducing the number of regimental courts-martial enlarged powers be given to commanding officers.

7th. That whenever the services of a shorthand writer can be obtained the examination of witnesses before a general court-martial be conducted *vivâ voce*.

8th. That cases of embezzlement be submitted to the ordinary criminal tribunals, where there are facilities for so doing.

9th. That in general courts-martial the list of witnesses, together with the charges, be furnished to a prisoner as matter of right previous to trial, and that he should also have reasonable notice of any additional witnesses whom in the course of the proceedings it may be thought desirable to adduce.

10th. That the practice of re-assembling a court for the purpose of revising their proceedings be discontinued, power being given to the confirming authority in certain cases to commute the sentence.

11th. That a regimental court should only be had recourse to when a district court cannot conveniently be assembled, and that it be composed of officers of not less than three years' standing.

12th. That the proceedings of all regimental courts be forwarded to the General Officer commanding the district.

With regard to military punishments we have recommended:—

1st. That one or more central military prisons be established, in which an improved system of military discipline can be carried on, in which separate confinement shall form an indispensable part, and that until that time arrangements should be made with the authorities of civil prisons for the reception of the requisite number of military prisoners, care being taken to separate them as far as possible from the other prisoners.

2nd. That the term habitual drunkenness as applied to the fourth offence be abolished.

3rd. That a scale of fines be substituted for the present system of imprisonment for this offence.

4th. That such fines constitute a fund for the benefit of the army generally.

5th. That the punishment of non-commissioned officers need not necessarily be accompanied by reduction to the ranks.

6th. That greater facility be afforded for the discharge of men of bad character.

7th. That the practice of "marking" be abolished when altered circumstances referred to in our Report will admit of it.

We annex a short analysis compiled from the Returns above alluded to, some of which are given at greater length in the Appendix.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE ROYAL COMMISSIONERS

APPOINTED TO INQUIRE INTO

THE CONSTITUTION AND PRACTICE OF COURTS-MARTIAL IN THE ARMY, AND THE PRESENT SYSTEM OF PUNISHMENT FOR MILITARY OFFENCES,

At No. 6, Old Palace Yard, Westminster.

Monday, 23rd March 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
THE RIGHT HON. RUSSELL GURNEY.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
MAJOR-GENERAL SIR ALFRED HASTINGS HORSFORD, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
SAMUEL WHITBREAD, ESQ.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

VERNON LUSHINGTON, ESQ., examined.

V. Lushington, Esq.
23 March 1868.

1. (*Chairman.*) What office do you hold?—I am Deputy Judge Advocate-General.

2. What is the exact nature, and what are the peculiar duties of the office of Deputy Judge Advocate-General?—I am the Judge Advocate-General's deputy, and as such I see all the work that passes through the office.

3. How long have you held that office?—I have actually done the duties since November 1863, but I have held the office since May 1864.

4. But the nature of your office is such that all proceedings of courts-martial go through your hands and you have an opportunity of forming a judgment upon them?—Yes, whatever work is done in the office I see, and take my part in.

5. And of course you are acquainted with the nature and the duties of all courts-martial?—Yes, as far as a civilian can know them. We do not receive in our office, generally speaking, the proceedings of regimental courts-martial, but they are from time to time referred to us. There is no substantial difference between them and general and district courts-martial.

6. Will you state to the Commission how many kinds of courts-martial there are?—They are the following: the general court-martial, the district or garrison court-martial, the regimental court-martial, and the detachment court-martial. Those are the common courts-martial. Then there are what I may call extraordinary courts-martial, which are the detachment general court-martial, and the general court-martial, held in India under the 101st section of the Mutiny Act, and general court-martial held for the trial of civil offences in places out of Her Majesty's dominions.

7. Will you state the nature of a general court-martial?—A general court-martial is the highest criminal tribunal in the army. It is the only court which can try a commissioned officer; it is the only court which can sentence a soldier to death, or penal servitude; and it is the only court which has power in all cases to sentence a soldier to be discharged with ignominy.

8. Are the duties of a court-martial exclusively confined to military crimes?—No. Under the 81st Article of War, a court-martial has jurisdiction over offences which are called "disgraceful conduct," and which really embrace all felonies whatsoever; so that a soldier is often tried for stealing, which is regarded for that purpose as a military offence. In the same way, in the case of the officers who were tried in Jamaica in 1866, it was alleged that they had committed murder; if they had been tried under the civil law they would have been tried for murder, but they were tried by general court-martial for scandalous conduct in abusing their powers under martial law. But generally speaking, of course, courts-martial deal only with military crimes.

9. In what way does a district court-martial differ from a general court-martial?—It differs from a general court-martial in its constitution, the number of officers not being so large; and it differs in its powers, in that it has not the power to try a commissioned officer, and has not the power to award a sentence of death or penal servitude.

10. What is the nature of a regimental court-martial?—A regimental court-martial is constituted of officers belonging to the regiment, and its powers are limited. It cannot award more than 42 days imprisonment.

11. Can a regimental court-martial try officers?—No.

12. What is a detachment court-martial?—A detachment court-martial is, for most practical purposes, the same as a regimental court-martial, but it arises when a part of a regiment is detached from the rest of the regiment on service, or when there is a detachment of troops consisting of portions of several regiments.

13. How do you distinguish a detachment general court-martial?—A detachment general court-martial is a very unusual tribunal indeed. It is for the purpose of trying offences committed against the population of a foreign country where a British army may be. It has the power of life and death.

V. Lushington, Esq.

23 March 1868.

14. How is it constituted?—It may be constituted of three officers only. It is regulated by a section in the Mutiny Act, and is really of importance, I should think, only on active service.

15. Under whose appointment is it?—I think it is by the commanding officer on the spot; it is for the commanding officer of the detachment of the troops, but there is a provision that the sentence shall not be executed without the approbation of the General commanding the army.

16. Are general courts-martial all conducted in the same manner, or do the courts-martial held in any of our provinces (in India, for example,) differ from the courts-martial held in England?—I should say that there was no substantial difference.

17. (*Lieut.-Gen. Scarlett.*) Is there not a difference as to number?—There is a difference as to the number.

18. (*Chairman.*) What is the constitution of each court?—In the United Kingdom and the Channel Islands a general court-martial must consist of at least 13 officers. Then there is a provision made in the Articles of War for a smaller number forming that tribunal in different places. The 106th Article of War regulates the number of officers required to constitute a general court-martial. You will see there that in certain places five commissioned officers would be sufficient; in other places seven would be sufficient; and lastly, in England and elsewhere, which practically means the United Kingdom and the Channel Islands, 13 are required. That Article is more explicit than the section in the Mutiny Act. The Mutiny Act deals with the subject in the 8th section.

19. Are the courts-martial the same in every branch of the service, is there any difference, for instance, between a court-martial held in the Guards and one held in the line?—Yes, there is a power in the Articles of War for a court-martial for the trial of men belonging to the Guards to be constituted of officers belonging to that regiment only. Generally speaking, a district or general court-martial is constituted of officers belonging to various corps quite irrespective of the regiment to which the culprit belongs; but in the Guards such a court-martial is constituted of officers belonging to the brigade of Guards only.

20. Is it the same with respect to the Artillery?—The Artillery have a similar power under, I think, the 150th Article of War.

21. (*Lieut.-Gen. Scarlett.*) Does that include the Engineers?—I think not.

22. (*Chairman.*) But their powers are identical, I presume?—Yes, the powers are identical.

23. And the difference is merely in the constitution of the court?—That is all.

24. Have you stated the whole of the powers of a general court-martial as to the trial and punishment of prisoners?—I have not. I have endeavoured to state what are the powers of general courts-martial as distinguished from district and regimental courts-martial; but there are a number of punishments which a general court-martial has power to award.

25. You stated that it was the only tribunal which could try a commissioned officer; to what punishments can a commissioned officer be subject?—He may be sentenced to death, to penal servitude, to imprisonment, to cashiering, to lose regimental or army rank, or to be reprimanded, and in one case he is liable to a fine.

26. Under what circumstances can he be subject to a fine?—In the case where he has embezzled property belonging to the Army or for Her Majesty's use; that case is specially provided for in the 17th section of the Mutiny Act.

27. Is that in the nature of a fine, or in the nature of restitution?—It is both; that is to say, there is a power under that section of awarding a fine, and it is made absolutely compulsory upon the court to sentence the offender to make good the loss. I have never known a case, however, in which a fine has been imposed in addition to the amount which the offender has embezzled.

28. Then none of the other courts-martial award the punishment of death?—Nothing but a general or general detachment court-martial, and also those peculiar tribunals which I have mentioned, namely, a general court-martial held in India 120 miles away from any of the Presidencies, or a general court-martial under the 145th Article of War.

29. A general court-martial also has exclusively the power of discharging with ignominy from the army, has it not?—In all cases, that is to say, for any offence, a general court-martial may discharge a soldier; but a district court-martial can only sentence a soldier to be discharged for desertion or for some act of disgraceful conduct. That is of some consequence, because a man is often brought to a general court-martial for the very purpose of getting rid of him.

30. What length of imprisonment has a general court-martial the power of awarding?—Not exceeding two years.

31. In what respect do the punishments differ under a district court-martial?—A district court-martial has power to award imprisonment up to two years, and it has power to award corporal punishment in certain cases.

32. What are those cases?—Those cases are now determined by the Mutiny Act of last year. They practically are confined to mutiny and insubordination accompanied with personal violence, except in the case where the soldier is in the field, or is serving on board a ship not in commission, or on the line of march. That last point is, I believe, rather doubtful, but if you will refer to the 11th and 22nd sections of the Mutiny Act, you will find exactly what the provisions of the Statute are.

33. Within what limits is the power of a regimental court-martial confined?—Its power of imprisonment is limited to 42 days, and practically now it no longer has the power, except on service in the field or on board ship, of awarding corporal punishment, the reason being that it is unusual, and in fact I may say illegal, to bring before a regimental court-martial an offender on such a charge as mutiny or insubordination accompanied with violence.

34. He then ought to be tried by a district court-martial?—He ought to be tried by a district court-martial.

35. But does it never happen that a soldier is brought before a regimental court-martial for those crimes?—I should think never, except on service in the field or on board ship.

36. In your experience has corporal punishment under those sentences of court-martial been on the increase or the decrease within the last few years?—It has immensely decreased in the last year.

37. Will you inform the Commission in what way courts-martial are convened?—A general court-martial or a district court-martial is always summoned by a convening officer, under a warrant which he holds, either direct from the Crown or from the Commander-in-Chief, or by delegation. The provision for that is the 6th section of the Mutiny Act. A regimental court-martial is convened by the commanding officer without any special warrant. That is also provided for by the Mutiny Act and the Articles of War.

38. Who is it that decides whether the crimes shall be tried by a general, a district, or a regimental court-martial?—In the first instance, the commanding officer determines whether he will bring a man to a regimental court-martial or not. If it is for an offence which is cognizable by a regimental court-martial, probably he would try the man in that way; but if it is a graver offence, then he has to send up an application for trial to the general officer commanding the district. I have the form if the Commissioners would like to see it. Then the general officer, if he has the power to order a general court-martial, and considers that the man should be tried by a general court-martial, would then convene such general court-martial; but

if, on the other hand, he thought that a district court-martial would suffice, then he would convene a district court-martial; and if he had not the power to convene a general court-martial, and yet it was required, he would then send on the application to a higher authority.

39. You said, "If he has the power of ordering a "general court-martial." What did you mean by that?—That entirely depends upon his warrant. I believe as a fact an officer who has power to convene a district court-martial has generally power to convene a general court-martial, but that depends upon the Horse Guards.

40. Is there no general rule which decides that point?—I can only tell you that I believe every officer who holds an important command in England has a warrant to convene either a general or district court-martial. For instance, the officer commanding at Manchester or the officer commanding at Devonport would have such power, but it entirely depends upon the warrant.

41. (*Lieut.-Gen. Scarlett.*) Would it be the senior officer of the force; for instance, at Aldershot, would it be the senior officer who would have that power?—No doubt that would be so; but it entirely depends upon the warrant. A general court-martial cannot be convened except by an officer holding the necessary warrant. The Act gives power to issue this warrant, and you will see there that the warrant may be issued to any officer holding a command. The provision in the 6th section of the Mutiny Act is as follows: "Her Majesty may, from time to time, in like manner "as has been heretofore used, grant commissions "under the Royal Sign Manual for the holding of "courts-martial within the United Kingdom of Great "Britain and Ireland, and may grant commissions or "warrants under the said Royal Sign Manual to the "chief Governor or Governors of Ireland, the Com-"mander of the Forces, or the person or persons "commanding-in-chief or commanding for the time "being any body of troops belonging to Her Majesty's "army, as well within the United Kingdom of Great "Britain and Ireland and the British Isles as in "any of Her Majesty's garrisons and dominions or "elsewhere beyond seas, for convening courts-martial, "and for authorizing any officer under their respective "commands to convene courts-martial as occasion may "require." That leaves it entirely a matter of discretion practically to the Commander-in-Chief. There are some commands which are not held by general officers. For instance, there is the command at Colchester, which is held at present by Colonel Tidy; he would not have the power of convening a general court-martial.

42. Do you know the nature of the warrant under which that officer holds his command?—I think I had better hand in copies of the warrants.

43. Will you explain to the Commission who, in case a crime happens which ought to be tried by general court-martial, is the authority who should decide that it shall be so tried?—I will state what is the course of proceeding. Supposing the offence committed, such as striking an officer, the offender would be brought before the commanding officer in the ordinary way. Evidence would be given of the commission of the crime, then, that being done, and the soldier being asked what he had to say in his defence, he would then, to use a common phrase, be put back for a court-martial. The evidence would then be abstracted and put on paper, and the form of the charge made out, and then that would be sent by the commanding officer to the general officer of the district with a letter applying for a trial of the man. I have here the form of the application. It is a War Office form, No. 733. It is a letter addressed to the general officer in these words: "Sir,—I have the honour to submit a "charge against private So-and-so under my com-"mand, and request that you will obtain the sanction "of" (the general officer) "that a general or district "court-martial may be assembled for his trial;" and then the commanding officer signs that letter. In a district where the officer commanding is not a General—such as Colchester, for instance—he would, I think, transmit this letter to the Adjutant-General as the organ of the Commander-in-Chief. The Adjutant-General would then forward that charge and the abstract of the evidence to the Judge Advocate-General. The charges would be settled in the Judge Advocate-General's office, and returned by the Judge Advocate-General to the Adjutant-General, and the trial would then be held.

44. By what department would the tribunal of a general court-martial be ordered?—In the Colchester case the order for a trial would emanate from the Adjutant-General.

45. Would he order the officers to compose the court?—No, he would name the president; the other officers of the court take their duty according to a certain roster. There is no actual nomination of officers to sit on the trial.

46. I understood you to say, that in that case the Adjutant-General would decide whether it should be a general or a district court-martial?—Yes, he would, the reason being that the officer commanding at Colchester would not have authority to order a general court-martial; but it would be otherwise at Aldershot, for instance. In that case there would be no correspondence with the Adjutant-General; the officer commanding at Aldershot would send direct to the Judge Advocate-General the charge and the abstract of the evidence, and would receive back the charge settled; and the officer commanding at Aldershot would then himself order the trial.

47. Would that be the case in every command where the officer was a general officer?—I think so; but at any rate in any command where the officer commanding the district had a warrant enabling him to assemble a general court-martial. He must be a general officer to hold a warrant for a general court-martial; but I do not quite know who it is that determines what warrants should issue. I think it is arranged between the Commander-in-Chief and the War Office.

48. (*Lieut.-Gen. Peel.*) When you mention the Adjutant-General you only speak of him as the executive officer of the Commander-in-Chief?—Quite so; he is simply the officer in whose name it is done.

49. (*Mr. Mowbray.*) In the great majority of cases we receive communications directly from the officer commanding the district?—No doubt, the fact being that he holds the necessary warrant.

50. (*Lieut.-Gen. Peel.*) If a crime is committed by a man in any regiment, in the first instance the commanding officer of that regiment decides whether or not he shall be tried by a regimental court-martial; if he thinks it too serious a case for that, he reports to the general officer of the district, whoever that may be, and if the general officer thinks that it ought to be tried by a general or district court-martial, he would order such a court to assemble?—Precisely so; but the commanding officer has a power under the Articles of War of applying to a higher authority for the purpose of trying more serious crimes by regimental court-martial.

51. (*Lieut.-Gen. Eyre.*) Desertion, for example, is distinctly speaking an offence only cognizable by a district or general court-martial; but it may be tried with the sanction of the general officer commanding the station, by a regimental court?—Yes, but not as desertion; as absence without leave.

52. (*Chairman.*) Is there any power in the Horse Guards, or is it in the power of a general officer commanding a district when a case has been submitted to him for a general court-martial or a district court-martial, to remit the case to a regimental court-martial?—There is a general power providing that, by permission, some grave offences may be tried by a tribunal, which otherwise has not jurisdiction over such offences: that power is no doubt exercised from time to time by superior authority; but the provision is somewhat vague, and I think that other persons

V. Lushington, Esq.

23 March 1868.

would be much better qualified than myself to state to the Commission what the practice is.

53. (*Lieut.-Gen. Scarlett.*) Are not certain crimes specified which may be tried by a regimental court-martial, and others which must be tried by a general or district court-martial by the Articles of War?—That distinction is often taken, but I do not think that you can say of every offence that provision is made whether it shall be tried by a regimental court-martial or only by a higher court. The Article of War to which I have been referring is the 140th: "No commanding officer shall, by giving in against a prisoner "vague and indefinite charges, try before a regimental "court-martial grave offences which are directed to "be tried by general, district, or garrison courts-"martial.; but as it may be advisable that some of "the foregoing offences, which in certain cases may "admit of less serious notice, should be tried by dis-"trict, garrison, regimental, or detachment courts-"martial, in such cases the officer commanding the "battalion, corps, or detachment, who may deem it "advisable so to proceed, shall lay a statement of the "case, together with the charge he intends to bring, "before the general or other officer commanding the "brigade, district, or garrison, with an application so "to proceed. The General or superior officer will "exercise his discretion in directing the description "of court by which the offender shall be tried; but "the permission to try grave offences by district, "garrison, regimental, or detachment court-martial, "shall be noticed in the monthly return of courts-"martial sent in to Our Adjutant-General."

54. (*Chairman.*) The decision rests with the then general officer?—Yes.

55. Has the person charged with the crime any voice in that; can he object to be tried by one or other of those courts?—No; he has no power to object at all. If he is brought before a regimental court-martial he might say that he wished to be tried by a higher court, but such objection would, I think, certainly be overruled. He has no voice in the matter, though, in some cases, it might be granted.

56. (*Lieut.-Gen. Scarlett.*) Would it not be against his own interest so to object, inasmuch as the regimental court-martial can only give a very limited punishment?—In most cases it would be so; but in some cases a soldier might prefer not to be tried by officers of his own regiment.

57. (*Chairman.*) Does it ever happen that a soldier applies to be tried by a different court from that assigned to him?—Yes, I have known it to happen. There is no right of appeal.

58. Has the general officer the power to direct whether it shall be a regimental or a district court-martial without an application from the officer commanding the regiment?—The application always comes, in the first instance, from the commanding officer of the regiment, and the general officer would communicate with him, and would state what his wishes were.

59. Supposing the general officer takes a different view from the officer commanding the regiment, has he the power to decide which court it shall be?—Certainly.

60. (*Mr. Russell Gurney.*) Without any application from the commanding officer to have the lower tribunal?—Yes.

61. (*Chairman.*) You have stated the number of members of a general court-martial, did you also state the number of members upon a district court-martial?—I did not.

62. Will you state the number of officers composing a district court-martial?—That also varies according to the place in which the court is held. You will find that provided for by the 108th Article of War. It is sometimes seven, in some places five, and in a few places it may consist of three officers only.

63. Of how many members does a regimental court-martial consist?—A regimental court-martial, generally speaking, must consist of five officers; but if that number is found impracticable (which I should say is entirely for the discretion of the commanding officer), then three officers are sufficient. That is provided for by the 112th Article of War.

64. Have you described the whole constitution of the court in the case of a general court-martial? Are there any other officers present, except the president and the members of the court?—There is the Deputy Judge Advocate.

65. What is the duty of the Deputy Judge Advocate in a general court-martial?—The duties of the Deputy Judge Advocate at a general court-martial are now determined by Her Majesty's Regulations, section No. 771.

66. By whom is the Deputy Judge Advocate in a general court-martial appointed?—In the United Kingdom there are now Deputy Judge Advocates of districts. There are three such Deputy Judge Advocates. One for the London district, one for Scotland and the North of England, and then there is a Deputy Judge Advocate for Ireland. The Deputy Judge Advocate attends every general court-martial within his district.

67. What position does he take in the court?—He is a kind of assessor to the court.

68. What is the nature of his appointment?—He holds a deputation from the Judge Advocate-General.

69. To that particular court?—No, not to that particular court; it is a general deputation.

70. Then who appoints him to that particular court?—He holds a general deputation from the Judge Advocate-General to attend any general court-martial held within the district.

71. Then when a general court-martial is assembled, is it for the Deputy Judge Advocate to determine whether he shall attend that court, or not?—The Deputy Judge Advocate of the district, as a matter of duty, attends the court.

72. When a court is assembled, what position does the Deputy Judge Advocate take in the court?—His duties are peculiar. I think, if I was asked to describe them in one word, I should say he was assessor to the court. His duty now is very different from what it was.

73. What is his present duty?—Formerly the Deputy Judge Advocate continually acted as prosecutor, and yet at the same time he was a kind of referee on legal questions. It has been altered, I think, since 1862. It was then provided that in no case should the Deputy Judge Advocate act as prosecutor. These district Deputy Judge Advocates have since been appointed and their powers have been very considerably enlarged. At present it is provided that the Deputy Judge Advocate is to maintain an entirely impartial position and to act as assessor; he is to give his advice on all matters of law, evidence, and procedure, and whether consulted or not it is his duty to interfere to ensure the due formality and legality of the proceedings; he has to sum up the evidence and give his opinion upon the legal bearing of the case before the court proceeds to deliberate on its finding, and his opinion is to be taken as final by the court.

74. (*Mr. Russell Gurney.*) His opinion on what?—On any question of law.

75. (*Chairman.*) The Deputy Judge Advocate then no longer acts as prosecutor?—No.

76. Now that he is no longer prosecutor, who is the prosecutor?—The prosecutor is an officer appointed.

77. By whom?—I really am not quite sure. I do not know whether it is the General convening the court, but I think it is generally provided for otherwise in the regiment to which the prisoner belongs.

78. (*Lieut.-Gen. Scarlett.*) In a district court-martial does the adjutant generally prosecute?—Generally.

79. (*Chairman.*) I think you seem to object to give evidence directly upon the appointment?—I can say that there is no regulation upon it. There is no provision made for it.

80. In the case of a general court-martial will you describe what is the rank which is necessary for an

officer to hold to be a member of that court?—No rank is necessary to enable an officer to sit as a mere member of a general court-martial. An ensign may sit as a member of a general court-martial, but the president must be of a certain rank, he must be a field officer unless it is absolutely impracticable.

81. (*Lieut.-Gen. Scarlett.*) Is it ruled at all by the rank of the person to be tried?—Yes; very much. There are regulations upon it.

82. (*Chairman.*) Supposing it is a field officer who is to be tried, can any officer sit upon that court but a field officer?—The provision upon the subject in the Articles of War is that no field officer shall be tried by any person under the degree of captain.

83. It is only under peculiar circumstances, I presume, that a field officer can be tried by a court of which a captain is a member?—I have no doubt that if a field officer was to be tried, if possible it would be arranged that no captain should sit upon his trial or only one. If you will allow me, I will refer you to the passage in the Queen's Regulations upon that subject, the 738th and 739th sections: "Whenever general officers or colonels are available as "presidents of general courts-martial, no officer of "inferior rank is to be placed on that duty. Whenever it can be arranged, without serious inconvenience to the service, the members of a court-martial, assembled for the trial of an officer, are to "be of equal if not superior rank to the prisoner, "and in no case but one of necessity is a colonel to "sit upon the trial of a general officer or a captain "on that of a field officer or a subaltern officer on "that of a captain. On the trial of subaltern officers, "two officers of that rank are considered a sufficient "proportion to be detailed as members of the court. "The members of a court may, however, be of any "rank superior to that of the prisoner."

84. As a general rule then you do not put on a court-martial officers of an inferior rank to the officer to be tried?—Certainly not.

85. (*Marquis of Hartington.*) There appear to be regulations affecting the constitution and powers of courts-martial contained in the Mutiny Act, in the Articles of War, and in the Queen's Regulations. The Mutiny Act we know is an Act of Parliament. Will you state what is the exact authority to be attached to the Articles of War?—Your Lordship will find that the 1st section of the Mutiny Act provides that "It shall be lawful for Her Majesty to "make Articles of War for the better government of "Her Majesty's army, which Articles shall be judi-"cially taken notice of by all judges and in all courts "whatsoever." Her Majesty does make Articles of War and issue them. There is a provision in the same section of the Mutiny Act that "No person "within the United Kingdom of Great Britain and "Ireland or within the British Isles shall by such "Articles of War be subject to suffer any punishment "extending to life or limb or to be kept in penal "servitude, except for crimes which are by this Act "expressly made liable to such punishments as afore-"said, or shall be subject, with reference to any "crimes made punishable by this Act, to be punished "in any manner which shall not accord with the "provisions of this Act." That therefore is the limit which is imposed by the Statute upon the Articles of War, but subject to that limit I conceive that Her Majesty, as the head of the army, has the power to make whatever Articles may seem to her to be right for the government of the army.

86. Then what distinction would you draw between the Articles of War and the Queen's Regulations?—No distinction, except one of mere convenience; that is to say, the Articles of War for the most part define military crimes, whereas the Queen's Regulations provide regulations for the duties of officers and soldiers under a great variety of circumstances.

87. But the Queen's Regulations do contain directions as to the practice of courts-martial, do they not?—Yes, all that is a matter of arrangement.

88. (*Mr. Russell Gurney.*) But is there any provision in the Mutiny Act giving the same force to the Queen's Regulations as is given by the first section to the Articles of War?—There is none, the first section of the Mutiny Act says that Her Majesty may make Articles of War.

89. And that they shall be judicially taken notice of by all judges and in all courts whatsoever?—They must be taken notice of, but whether Articles of War derive all their authority merely from the Mutiny Act is another question.

90. (*Lieut.-Gen. Scarlett.*) Would a judge be obliged to take judicial notice of the Queen's Regulations?—No. I think that it will be found that it is generally assumed that there is a customary power in the army of punishment. For instance, the punishment of imprisonment by a commanding officer depends partly upon the Articles of War and partly upon the Queen's Regulations. There is no provision at all in the Mutiny Act for that. It is a very large question.

91. (*Chairman.*) It is the duty of the Deputy Judge Advocate to advise the court in everything relating to the Articles of War and the Mutiny Act, is it his duty to take notice of the Queen's Regulations?—Certainly.

92. He has to advise the court in all matters of that kind?—Yes, and beyond that, in all matters of law.

93. I understood you to say that his duty is not only to sit as the adviser of the court in case of necessity, but that it is his duty to interfere if he sees anything going which is inconsistent with the Articles of War, or with the Queen's Regulations, or with the Mutiny Act?—Or with due and customary course.

94. Has he ever to address the court?—He has to sum up the evidence at the close of the case.

95. At what period does he sum up the evidence?—Just as at an ordinary trial before a civil court.

96. Does he sum up the evidence for the prosecution before the defence commences?—He waits till the close of the case when all the evidence is taken, and then his address would be somewhat like that of a judge to a jury, taking into account the difference between the relation of a judge to a jury and that of the deputy judge-advocate to the members of the court, who are sometimes his equals, and in some cases his superiors.

97. What is the province of the prosecutor; does he appear in the light of the Attorney-General in a case for the Queen?—It is difficult to give a direct answer to that question, because, as you have heard, there is no provision made for the appointment of a prosecutor, and his duty seems to be differently regarded in different districts. He does to a certain extent conduct the prosecution; that is to say, he examines the witnesses for the prosecution, and if there is any application to be made to the court, say for an adjournment in the interests of the prosecution, or anything of that kind, he is the officer who has that part of the case to conduct.

98. Does he make any address?—He may if he likes, and in graver cases he frequently does. I know that many general officers think that it is the duty of the court to take care that sufficient evidence is adduced for the investigation of the case, and if a case miscarries by reason of insufficient evidence for the prosecution I have often seen it made a matter of observation by the revising officer that the court were remiss in their duty in not calling certain evidence. One would say according to ordinary notions that was the duty of the prosecutor, and that it would be advantageous, as he may know all the circumstances beforehand, and the court cannot, that it should be his duty to take care that all the necessary witnesses are present.

99. You say that it is not invariably the case that there is a prosecutor?—There is always a prosecutor at a general court-martial, I should say, and I believe always at a district court-martial, but I should think that his duties were oftentimes very slight.

V. Lushington, Esq.

23 March 1868.

100. Has he the power of cross-examining the witnesses for the defence?—Yes, certainly.

101. Has he all the powers given to a counsel in the courts of civil law?—Yes.

102. At what period in the inquiry does he address the court?—The rules as to addressing the court are practically the same now as the rules for counsel at the trials of prisoners at the assizes. That is now provided for by the Queen's Regulations, Article 772:—"With a view to regulate and render uniform the "procedure of general courts-martial in respect to "addresses to the court from the officer conducting "the prosecution and from the prisoner the following "instructions are also to be observed:—The officer "conducting the prosecution is to be allowed an "opening address. At the close of the evidence for "the prosecution the Deputy Judge Advocate will "ask the prisoner if he intends to adduce evidence. "If the prisoner then replies in the negative the "prosecutor will proceed to address the court a "second time, for the purpose of summing up his "evidence, after which the prisoner may address the "court in his defence. At the conclusion of his address the Deputy Judge Advocate will in open "court sum up the case to the court. If, in answer "to the Deputy Judge Advocate, the prisoner states "that he intends to adduce evidence he may open his "case with an address before calling his witnesses. "At the conclusion of the evidence he may again "address the court, after which the prosecutor will "be entitled to a reply. In those special cases where "evidence is allowed in reply, the second address of "the prisoner is to be made after such evidence, and "immediately before the prosecutor's reply. The "address in open court of the Deputy Judge Advocate summing up the whole case is to follow the "prosecutor's reply. After the Deputy Judge Advocate has spoken, no other address is to be allowed, and the court will retire to consider its finding."

103. Is the prisoner entitled to any legal assistance in his defence before the court?—I believe the rule is that a court-martial will not hear any one except the prisoner. They allow, I believe, where there is a written address a friend, generally a brother officer, to read such address, but no legal gentleman is allowed to raise his voice in court. At the same time it is permitted to a prisoner to have the assistance of any legal gentleman whom he chooses to employ, and that gentleman sits, I believe, near him, and communicates with him, and suggests various questions and points in the defence. He is a silent adviser.

104. What power has the prisoner of cross-examining the witnesses for the prosecution?—The prisoner is entitled to cross-examine in the ordinary manner. The way in which the questions are put is different from that which is in use elsewhere, but subject to that the prisoner is allowed to conduct the cross-examination as he chooses.

105. Have the prisoner and the prosecutor an equal power of cross-examination?—Yes.

106. Equal in manner?—Yes.

107. They are both restricted by the same regulations, are they not, as to the mode in which they shall conduct their questioning?—Yes.

108. And that I believe is invariably through the president?—I have never been present at a court-martial, but I believe the course is this. If a witness is being examined for the prosecution, the prosecutor writes his question upon a slip of paper, and hands it to the president. The president, if he approves of it, hands it to the Deputy Judge Advocate, whose duty it is to take a record of the proceedings. The Deputy Judge Advocate either files it, which is the shorter way of doing it, or else he copies down the question in the proceedings, and having done so he reads the question to the witness. The witness answers it and he takes down his answer. It would be in the same way with regard to any question asked in the cross-examination.

109. Is the prisoner called upon for his defence immediately after hearing the evidence for the prosecution?—He is called upon for his defence, but it is usual to grant an adjournment if he applies for I believe that very often the greatest indulgence is given in that respect. The court sometimes adjourns for several days in order to enable a prisoner to prepare his defence.

110. And he is obliged to proceed with the cross-examination of each witness as he gives his evidence?—He is not. It is more or less customary for a prisoner to ask to be allowed to defer cross examination until his defence, which I think is not a very convenient arrangement. He, perhaps, most commonly asks the questions at the time, but it is not uncommon for a prisoner to ask to be allowed to defer his cross-examination.

111. (*Mr. Russell Gurney.*) Is that always allowed?—I think always, in fact I think it is done without any special application or permission.

112. (*Chairman.*) When the trial is over does the Deputy Judge Advocate remain in the room and consult with the court?—The Deputy Judge Advocate is regarded for many purposes as a member of the court. He does not vote, but I believe he is always present at their proceedings for the purpose of assisting in the judgment.

113. When the court has heard the evidence on both sides, would the Deputy Judge Advocate think himself justified in advising the court as to the guilt or innocence of the prisoner, and as to the extent of the punishment which should be awarded?—I would rather that Colonel Laye, who is a Deputy Judge Advocate, should describe to you exactly what takes place when the Court retire to consult. I have no doubt that they would in all cases mention to him the sentence which they desired to pass in order that they might get his opinion as to the legality of it.

114. But would the Deputy Judge Advocate think himself justified, supposing that the officers of the court awarded a particular punishment, in advising that the crime deserved a higher or a lesser punishment?—I should think that he probably would not express any opinion upon that unless he was specially consulted. Although his duties are defined here, this is only a new regulation, and therefore the limits of his duties are still a little uncertain.

115. Is it the duty of the Deputy Judge Advocate to take any part in the proceedings in defence or in advice of the prisoner?—The regulation on that point is this: "In all cases where a prisoner is undefended "the Deputy Judge Advocate is to take care that the "prisoner does not lose any privilege that the law "allows him in the conduct of the trial."

116. Under that order would you think yourself justified as Deputy Judge Advocate, if the prisoner had no other friend in the court, in pointing out any advantage that he might get in the cross-examination of the witnesses?—I think it would depend very much on the circumstances. It is something like the position of a judge when a prisoner is undefended. He would say, "Prisoner, have you no questions to ask this "witness?" and no doubt the Deputy Judge Advocate, in addressing the court, would call attention to the circumstances which seemed favourable to the prisoner, probably with more detail than he would if the prisoner had been regularly defended. But it is very difficult to define exactly what the duty of the Deputy Judge Advocate is under those circumstances.

117. (*Mr. Russell Gurney.*) You spoke of the counsel as being the silent adviser of the prisoner; is it as a matter of right that he should have counsel at all?—It is a matter of custom.

118. Are there not cases in which counsel have been told that they must retire?—I am not aware of any.

119. (*Lieut.-Gen. Scarlett.*) Has not every prisoner a right to legal advice if he has the means to pay for it?—I have no doubt we should so advise if we were asked, but we never have been asked.

120. Have you ever known it refused?—No.

121. If the prisoner has legal advice does it make

any difference in the appointment of the Judge Advocate?—It may do so: the Deputy Judge Advocate, who is a military officer, may obtain permission to have legal assistance in the shape of a barrister to act as his silent adviser, and similar legal assistance may be furnished to the prosecutor. That is not very often done, but it is done in cases of importance; for instance, I may cite the Jamaica case, where two officers were tried on very serious charges. Mr. Gibbs, a barrister, was sent out to assist the Deputy Judge Advocate, and attended the trial, and at the same time the prosecutor received the assistance of the attorney-general in Jamaica, whilst the prisoners also employed the assistance of counsel in that silent manner which I have described.

122. (*Mr. Russell Gurney.*) Does the court put any questions to the witnesses?—Any question they think right.

123. Upon any point which they think requires clearing up they put questions?—Quite so.

124. In the same way as a judge in a civil court?—Quite so.

125. (*Chairman.*) Do the members of the court put their questions through the president?—I believe all questions are put through the president. In the proceedings it is simply put "*By the Court.*"

126. Is the same procedure adopted throughout as to the questions being written on paper?—I could not answer that as to the questions put by the court.

127. (*Mr. Whitbread.*) In what way is the court constituted; is it constituted by selection?—The president is appointed by the convening officer. The other members of the court take court-martial duty according to the roster, as provided for in the Queen's Regulations.

128. (*Chairman.*) Is a prisoner at the commencement of the proceedings, and if so how long before, furnished with a list of the witnesses that are to come against him?—There is no absolute law upon the subject, but as a matter of fact I think he usually is provided with a list of witnesses a reasonable time before his trial; and in some cases I have known an abstract of the evidence to be given by such witnesses to be likewise furnished to him.

129. It is not a necessity that he should be furnished with one or the other?—I think it is usual to do so. The 744th section of the Queen's Regulations provides—"On general courts-martial it is the duty of the "officiating judge advocate to furnish the accused, "within a reasonable time before the trial, with a "copy of the charge to be preferred against him. "In the case of trial by inferior courts this duty will "devolve on the adjutant. To a soldier who cannot "read the charge is to be read, and, if necessary, "explained by the person who warns him for trial." That is as to a copy of the charge. I do not think there is any regulation with respect to the witnesses.

130. Does that rule apply to other than general courts-martial?—Yes, as to the copy of the charge.

131. It is the practice, then, in a district or a regimental court-martial to furnish the accused with the nature of the charge, or of the evidence that will be brought against him?—With the nature of the charge certainly always, and I should think very often with a list of witnesses.

132. How long before the court sits would that information be furnished to him?—There is no time appointed, but I should think generally ample time is given to the prisoner.

133. Is the prisoner himself obliged to give any notice of the evidence that he will adduce in his defence?—No, but he very often has to apply for certain witnesses to be summoned. I think the usual custom is that the adjutant inquires of the prisoner whether he desires any witnesses to be called, and the prisoner having named the witnesses, the adjutant generally, unless the request seems extremely unreasonable, summons the witnesses.

134. Is there any power at all in the court to summon witnesses for the prisoner?—The Mutiny Act and the Articles of War provide that the witnesses shall be summoned by the judge advocate or the president. But in fact the witnesses are generally military persons, soldiers and so on, and the adjutant or commanding officer of the regiment to which the prisoner belongs generally takes care that they are in attendance without a formal order; but in any case arising where such an order was wanted, of course the president would immediately issue the order. There is a form for the attendance of a civilian witness. The power given by the Mutiny Act really extends to military witnesses as well, but it is not necessary to employ that formal power, because it is generally provided for as a matter of course by the adjutant or by the commanding officer of the regiment to which the prisoner belongs. The 13th section of the Mutiny Act deals with that.

135. You are a barrister, I believe, are you not?—Yes, I am of eleven years' standing at the bar.

136. Is there any difference between the power a prisoner has at a court-martial, and the practice in other courts of law with respect to obtaining his witnesses?—I think in that respect the prisoner has a great advantage before a court-martial, because he has the power of his officers to assist him in getting his witnesses together.

137. But in defending himself before the court, has he all the same privileges in a court-martial that he has in a civil court?—I think he has, subject to this, that of course the efficient power of cross-examination is immensely less under the court-martial system when it has to be done on paper in the circuitous manner I have described; and I suppose he is to a certain extent limited in his address to the court. I mean to say that as a soldier he cannot comment so freely upon the evidence, especially upon the evidence of superior officers concerned in the trial, as a civilian would; and of course he has not the full advantage of counsel; but if you compare it with the ordinary case of a man being tried by a civil tribunal who is not defended by counsel, I do not think there is so very much difference.

138. (*Lieut.-Gen. Scarlett.*) Do you ever recollect a case in your experience of the practice of courts-martial of a prisoner complaining that he had not the privilege of cross-examination?—It would be treated as a most serious blot upon the trial, if any question was refused. We have had occasions where questions put by prisoners to witnesses have been improperly refused by the court, and in such cases it has not been uncommon for the whole proceedings to be set aside.

139. (*Marquis of Hartington.*) Did you refer to the passage in the regulations which defines the duties of the Deputy Judge Advocate?—It is the 771st section.

140. The Deputy Judge Advocate is mentioned in the Articles of War, but his duties or position in the court are not defined there, are they?—No, they are not, except that it is provided that he shall not be prosecutor.

141. The Articles of War state that the Deputy Judge Advocate shall not be prosecutor, but they do not state that there shall be a Deputy Judge Advocate or what he is to do?—They do not state what he is to do.

142. His duties then are defined merely by the Queen's Regulations?—Yes, and the custom of the service.

143. (*Mr. Whitbread.*) In recording any answers, is the prisoner's or the witness's first answer taken down or is he allowed to amend it if he desires to do so before it is finally recorded in the proceedings?—I think there is a reasonable power of amendment given. It would be the same there as anywhere else.

144. You can hardly speak from personal experience on that point?—I cannot.

145. (*Mr. Russell Gurney.*) Would they not put down both?—No doubt they would exercise a discretion about it.

146. (*Mr. Whitbread.*) Cannot the witness demand to have a different answer taken down and recorded

V. Lushington, Esq.

23 March 1868.

from that which he gave in the first instance?—I believe as to that the practice is for the evidence of each witness to be read over to him after he has concluded his evidence, and then if he desires any amendment it is either amended, or if it bears a suspicious character then I dare say they would state what it was that the witness desired to be altered.

147. (*Lieut.-Gen. Scarlett.*) At the end of his evidence they would read it over to him and he might always correct what he wished to be altered?—Quite so.

148. (*Mr. Russell Gurney.*) There is a power now given to have a short-hand writer, is there not?—Yes, there is.

149. Has that introduced any change in the mode of examining a witness?—No; except that when the short-hand writer is actually employed I rather doubt whether the Deputy Judge Advocate takes his own note quite so fully, and finally the proceedings are made up of the short-hand writer's note certified by the Deputy Judge Advocate.

150. (*Lieut.-Gen. Eyre.*) Does that supersede the necessity of all the proceedings being written?—It does not at present.

151. Do you thing it might not in some cases have that effect?—I think that is a most important point.

152. (*Chairman.*) When the court has terminated its inquiry and decided upon the guilt or the innocence, and if guilty on the sentence, of the prisoner, how does it proceed to announce that to the prisoner, is he called upon to be present in the court?—I will take the finding first of all; we will suppose that the finding is one of guilty, they do not announce that at all, but they re-assemble and then they take evidence of previous convictions. In that way a prisoner practically knows that he is found guilty to a certain extent at any rate. The court then consults again and passes the sentence and records the sentence, but it is not announced in any form to the prisoner. The court breaks up, the proceedings are signed by the president and are then sent in the case of a district court-martial to the confirming officer. The confirming officer peruses the proceedings and forms his own judgment upon them, and according to that judgment he may take one of several courses.

153. (*Marquis of Hartington.*) Is the confirming officer the convening officer?—Not always. For instance, with respect to all general courts-martial in the United Kingdom, the convening officer is generally the general officer of the district, sometimes it is the Commander-in-Chief; but the confirming officer is the Sovereign. In the case of a general court-martial the proceedings are sent direct to the Judge Advocate-General for submission to Her Majesty. The confirming officer may first of all, if he thinks fit, withhold his confirmation, the result of that being that the whole proceedings are null and void, and the trial naught. No finding is considered a sentence until it is approved by the confirming officer. That is the custom of the service, to some extent regulated by the Mutiny Act and the Articles of War.

154. (*Chairman.*) To what extent is it so regulated?—That would require going into the sections by detail. For instance, there is no provision made in the Mutiny Act that every court-martial shall be confirmed.

155. (*Lieut.-Gen. Scarlett.*) Does the Mutiny Act say that no punishment shall take place until the proceedings of the court-martial are confirmed?—It does in some cases, but not in all. The more general provisions as to confirmation are in the Articles of War. The 123rd Article of War is:—"No sentence "of a general court-martial shall be put in execution "till after a report shall have been made of the whole "proceedings to us; or to the officer commanding-in-"chief; or to some other person duly authorized by "us, under our sign manual, or by warrant granted in "pursuance of authority under our sign manual, to "confirm the same, and until our or his directions shall "have been signified thereupon; and no sentence of "death shall be carried into effect in any of our colonial "possessions until it shall have been approved in our "behalf by the civil governor or person administering "the civil government." That you will observe is confined to the case of general courts-martial. Then the 124th section deals with the detachment general court-martial.

156. (*Chairman.*) In a general court-martial there is no doubt that if the Queen's approval is not signified the proceedings are null and void?—Yes.

157. Is there any similar process in the case of the district court-martial?—Quite so; the general officer must confirm, or else the proceedings are null and void.

158. Supposing that in a district court-martial a prisoner is sentenced to a particular punishment and that sentence is not confirmed by the confirming officer, would that sentence be annulled?—Certainly. The court-martial according to the custom of the service has no power to carry out the sentence. The sentence is carried out by order of the confirming officer. The court-martial is in fact a trying tribunal, it is conducted as it were under the orders of the convening and confirming officer, and no sentence can be carried into effect until it has been approved by the confirming officer.

159. Does that apply to all three courts, the general, the district, and the regimental?—Yes; to every court-martial.

160. (*Lieut.-Gen. Peel.*) Is there not a power on the part of the revising officer to send the finding back to the court-martial to reconsider?—Yes, and that is of great consequence. He may first of all withhold his confirmation altogether, that comparatively rarely happens. He may if he thinks fit approve and confirm, and he would then give orders for the sentence, if any, to be carried out. He may further remit any portion of the sentence he thinks fit, and he has certain powers of commuting the sentence.

161. (*Chairman.*) Will you state his power of commuting sentences?—The power of commuting the sentencing of cashiering belongs to Her Majesty only. Even the Commander-in-Chief in India has no power to commute a sentence of cashiering. A sentence of death may be commuted to penal servitude or imprisonment. A sentence of penal servitude may be commuted to imprisonment.

162. To any period of imprisonment not beyond what you stated just now?—The limit is two years. Then corporal punishment may be commuted likewise to imprisonment with hard labour, or may be commuted to imprisonment without hard labour, and a certain portion of the corporal punishment may be inflicted in the prison; and, lastly, there is power for commuting a sentence of stoppages. Then the confirming officer has the power (this you will find, I think, to be a very peculiar provision, and one of very great importance,) of remitting the case for the consideration of the court, if he thinks that in any respect they have not dealt properly with it. He cannot direct them to take any new evidence, but if he disapproves of the finding he can direct them to reassemble and reconsider their finding. If they think fit they can stand to their former finding, but if they are persuaded by his remarks then they may find otherwise. Then as to the sentence, he may make any observations which he pleases on the sentence, and they will take his observations into consideration and act as they think fit upon them. The case would then come back to the confirming officer, and he would then take any course which he thought necessary, but he could not remit the case a second time to the court. That you will find provided for, by the 14th section of the Mutiny Act and the 163rd Article of War.

163. Does it often happen that on reconsideration of the sentence it is reversed?—Not unfrequently. Revisions occur in only a small portion of trials generally, but it occasionally happens that the sentence is altered on revision.

164. Does the confirming officer when he remits a case to a court-martial state in detail the reasons

which induce him to do so?—He generally states some reasons, and sometimes at length.

165. (*Mr. Whitbread.*) If he withholds his confirmation, what is the position of the prisoner?—He returns to his duty.

166. Can he be tried again for the same offence?—I should think not.

167. You say the proceedings are null and void, but in what way cannot he be tried?—There is a provision as to that in the 14th section of the Mutiny Act. The provision is not very clear, but there is, no doubt, that in a case of that kind he would not be tried again.

168. (*Chairman.*) Is there any appeal from any of the courts to any other tribunal?—I should say certainly not. By the practice of the service, if a man has any complaint he has the power of making it to the general officer at the half-yearly inspection, and in some cases if he makes a complaint to his commanding officer the commanding officer, if he thinks fit, will remit the case to the Judge Advocate-General for his opinion upon the subject, and the Judge Advocate-General gives his opinion, which in almost all cases is at once followed. Every district court-martial is sent finally to the Judge Advocate-General's office for safe custody, and is there perused, and if there is any mistake in law, if the thing is palpably bad, then the trial would be set aside in the form of a letter of advice written by the Judge Advocate-General to the confirming officer. But unless we receive a special application, we should not enter into the question how the balance of evidence was.

169. (*Lieut.-Gen. Scarlett.*) If you thought that the evidence was not sufficient to convict the prisoner, would you not in the Judge Advocate-General's office make some remark?—I am now speaking of the common case in which the proceedings are simply sent to us for safe custody. In these cases we peruse the proceedings, but we do not enter into the balance of evidence. If, however, the evidence were absolutely insufficient in law, or if there were any irregularity, we should take notice of that. I think that you will find that the majority of letters written in such circumstances upon district courts-martial are chiefly with reference to future guidance.

170. (*Chairman.*) But is it not the duty of the Judge Advocate-General to advise Her Majesty when he thinks that the evidence has not been strong enough to convict the prisoner?—The Judge Advocate-General when he submits the proceedings of a general court-martial to Her Majesty has, the duty of advising whether the proceedings are legal or not. If there was no evidence in law upon the charge; if the charge proved to be illegal, either in form or in substance, he would advise Her Majesty upon that that the proceedings ought not to be confirmed; but the Judge Advocate-General has little to do, generally speaking, with the weight of evidence; nor has he anything to do with the weight of punishment, provided that the sentence is a legal one upon the charge.

171. He has nothing to do with the discretion of Her Majesty, and it is only as a legal adviser that he gives his opinion?—I should think so.

172. (*Lieut.-Gen. Scarlett.*) Have there not been many instances in which the findings of courts-martial have been sent up to the Judge Advocate-General where the evidence has been found not to have been sufficient to convict the prisoner, and where the prisoner has afterwards been released?—Certainly. From time to time it has happened that the proceedings of a trial are specially referred to the Judge Advocate-General, and if he sees that there is no evidence, as a matter of right the man is at once released. In a number of cases also a military officer thinks it advisable to refer to the Advocate-General what the balance of evidence is. In all those cases the Judge Advocate-General, as I understand it, is simply the adviser of the military officers. He answers any question of that kind which is put to him, and if he is of opinion that the balance of evidence is in favour of the prisoner, he would say so, and the general officer would follow his advice.

173. (*Chairman.*) Have you in your office any record of the cases in which confirmation has been withheld?—We have from time to time cases of this kind; the trial is held; the confirming officer reads the proceedings and disapproves of them, and he writes at the end of them, as his minute, "Disapproved and not confirmed." The proceedings of such district courts-martial are like those of other district courts-martial sent to us, and we read them, and keep them.

174. Could you furnish the Commission with a list of the findings of general courts-martial, say, for the last five years, giving in distinct columns those which have been confirmed and those which have not been confirmed?—Yes. The only case that I can call to mind at this moment of a finding not having been confirmed, and which occurred before I entered the office, is the case, I think, of Lieutenant Robertson, who was tried at Dublin. That is the only one I can recollect, and I have not even perused that. There was also Drum-Major Butler's case. There the finding was set aside, I think, chiefly upon the ground of the evidence.

175. I collect from what you say that they are quite exceptional cases where the confirmation has been withheld?—Quite so.

176. Can you say the same with regard to district courts-martial?—Certainly; the vast majority of trials are free from any objection.

177. The findings of regimental courts-martial do not come into your office, do they?—No.

178. Into what office do they come?—They are kept with the regimental documents.

179. Are the regmental findings always kept with the regimental documents, or are they sent to the general officer of the district where the regiment is quartered?—I cannot answer that question with certainty. I believe they are always kept with the regiment, and there is I think a certain return made of the regimental courts-martial to the superior authority.

180. I think you stated that there is no appeal from a regimental to a district court-martial, or from a district to a general court-martial?—There is certainly no appeal as of right, and I should say that in practice there was none. I believe I have heard of cases in which men were ordered for trial by a regimental court-martial, and then they requested a trial by a district or general court-martial, and that request was granted; but when a man has been once tried, even by a regimental court-martial, it is quite clear that he cannot be tried again for the same offence. The Judge Advocate-General is generally to my mind the adviser to the military authorities, rather than an appellate judge. The cases are always in fact submitted to him by a superior authority; his decision is not a public decision: it is in the shape of confidential advice to a military authority; neither is it absolutely final, because in certain cases his opinion may not be followed by the military authority, though in the great majority of cases it is.

181. (*Mr. Mowbray.*) But though he is the adviser the advice is given with such authority that it is almost universally followed, is it not?—That is so; but the difference between a real court of appeal and an adviser may sometimes be of great consequence. For instance, both parties are not equally consulted, nor has a man always an opportunity of stating what he requires. There is no regular form of proceeding. It is something like the appeal to the Home Secretary with respect to convictions which have taken place before the ordinary tribunals.

182. Can you mention a single instance in which the advice of the Judge Advocate-General, that proceedings at a trial should be set aside, has been disregarded by the military authorities?—Certainly not.

183. (*Lieut.-Gen. Peel.*) But the advice of the Judge Advocate-General is confined strictly to the legality and not to the justice or amount of the sen-

V. Lushington, Esq.

23 March 1868.

tence, and therefore there is no comparison between that and the action of the Home Office?—Quite so, except in cases where his opinion on such points is specially asked.

184. (*Mr. Mowbray.*) But his advice is often taken and his opinion acted upon with respect to the weight of the evidence, is it not?—That is so. He does not advise upon that I understand, unless he is specially requested so to do.

185. He very often volunteers advice to generals commanding in different parts of the empire merely upon reading the proceedings of a court-martial and finding certain irregularities in them?—Yes, if there be irregularity, but not upon the mere weight of evidence.

186. (*Lieut.-Gen. Scarlett.*) But upon any matter of law the Judge Advocate-General's opinion is taken and acted upon?—Yes.

187. (*Chairman.*) What should you say was the character of most of the crimes which have passed the Judge Advocate-General's office in your experience?—I have never classified them, but I have no doubt the most common would be the minor form of insubordination, using insubordinate words to non-commissioned officers.

188. Has it occurred to you to inquire into the nature of the cases of insubordination?—No; and I confine myself necessarily to general and district courts-martial. I have never reckoned it up, but I think that you will find that the majority of cases consist of insubordination. It must be remembered however that you do not try a simple case of drunkenness by a district court-martial; you try habitual drunkenness by that tribunal; so that I can only compare insubordination with habitual drunkenness.

189. Have you made inquiry into the cases of insubordination which come through your office?—I have seen every particular case.

190. Could you ascribe to one general cause more than to another the cases of insubordination?—We have a great number of cases in which insubordination arises from drunkenness.

191. Do you believe that a very great majority of the cases of insubordination arise out of drunkenness?—I should be sorry to give an opinion upon that. I should think that probably it is so, but a commanding officer would give you much better evidence upon that than I could, because, for instance, the charge of insubordination is laid without any reference to the offence of drunkenness. The drunkenness, perhaps, never appears before the court, or if it appears it is treated as immaterial, or nearly so. To return to the subject I was speaking of just now, with respect to the advice which the Judge Advocate-General gives upon submitting the proceedings of a general court-martial to the Queen, it is really for the Judge Advocate-General to state the course taken much more than for myself. The trial is carefully read and the Judge Advocate-General forms an opinion upon the evidence. I am perhaps right in saying that what the Judge Advocate-General usually does is this, that he does not interfere upon a matter of evidence unless he feels it abundantly clear that the case has miscarried, and that the balance of evidence was decidedly contrary to the finding of the court. Of course the Judge Advocate-General, like every other high officer, has great discretion as to the advice which he would tender to Her Majesty, but speaking generally he is merely the legal adviser.

192. (*Mr. Russell Gurney.*) Would he act much in the same way as a superior court would act in ordering a new trial if the balance of evidence was decidedly contrary to the finding?—Just so. I think he would be even more reluctant than the court to interfere.

193. (*Mr. Whitbread.*) Can he order a new trial?—He can recommend a revision.

194. (*Mr. Russell Gurney.*) Can he equally do so whether the verdict has been favourable or unfavourable to the prisoner?—Yes, he can do so in either case; whatever the finding, the revising officer, if he disapproves of it, may call upon the court to reconsider it.

195. (*Marquis of Hartington.*) The Judge Advocate-General has not the power to send back the proceedings himself, has he?—No, he is simply the minister advising the Sovereign as the confirming authority.

196. Does a Commander-in-Chief under any circumstances summon a court-martial himself?—He has the power under a warrant.

197. But practically do you know any cases in which he does it?—I have no doubt that he did it in Colonel Crawley's case, but I could not say that he did. Generally speaking a general court-martial is convened by the district officer.

198. (*Mr. Mowbray.*) What is the practice with respect to Indian courts-martial?—The Commander-in-Chief in India has greater power than any other officer having general command (except the officer commanding-in-chief in China). He has the absolute power of determining all general courts-martial held upon commissioned officers under his command. Every other general officer, though he may try a commissioned officer, cannot finally dispose of a case in which a commissioned officer has been sentenced to death, penal servitude, or cashiering, all such cases being sent home for the consideration of the Sovereign. In India the presidential commanding officers hold the usual powers which are given to general officers holding command; but in the case of trials of commissioned officers which result in a sentence of death or penal servitude or cashiering, they have to refer them for the consideration of the officer commanding-in-chief in India. Besides that, in India, they have the system of district deputy judge advocates. In fact, the home deputy judge advocates came from India; we followed the Indian practice and it has been found I think to be a very great convenience. I do not think I have anything further to say about India, except that there is a power under the Mutiny Act to try soldiers for civil offences, if the soldier is 120 miles away from any of the presidencies. They have tried men for capital offences in that way and carried out capital sentences.

199. (*Lieut.-Gen. Scarlett.*) Is there any power of appeal to the Judge Advocate in England from the Indian courts-martial?—The district courts-martial are held in India and are finally settled in India, and so likewise are all the general courts-martial, but at the same time cases are occasionally remitted home to us by the officer in command there. The Judge Advocate-General, as I have said, is the adviser of the military authorities, and any officer in command may at any time remit any case to him for his advice.

200. (*Mr. Mowbray.*) His advice is also taken from time to time by the Commander-in-Chief, is it not, in respect to any matter?—Yes.

201. (*Lieut.-Gen. Peel.*) Has not the Commander-in-Chief in India the power of confirming courts-martial without reference to the Commander-in-Chief at home?—He has, as I stated; but after he has settled the matter it is sometimes re-opened.

202. In case of sentence of death he has the power of having an officer shot?—Yes.

203. (*Marquis of Hartington.*) In what way does the case come home?—By the Articles of War the proceedings of the trial are remitted home to be deposited in the Judge Advocate-General's office. If an important case arises the Commander-in-Chief in India acquaints the Commander-in-Chief here with it, and most probably furnishes him with documents relating to it, correspondence and the like. Then the Commander-in-Chief here, if he wants to go into the matter, sends over to the Judge Advocate-General's office for the proceedings of the trial. He has the proceedings, and then upon that he, if he thinks fit, submits a case to the Judge Advocate-General for his advice.

204. (*Mr. Mowbray.*) Upon receipt of proceedings from India does not the Judge Advocate-General notify

to the Horse Guards the proceedings?—Yes. The notification is a mere return, in ordinary cases it is sent and there is an end of it. It is, I believe, a mere formal statement of the charge, the finding, and the sentence. I am not sure whether the observations of the revising officer are stated or not, but it is generally treated as a mere formal document, and in fact it is never used hereafter in any case, because if any case arises you of course refer at once to the original proceedings.

205. (*Lieut.-Gen. Peel.*) In the case of Captain Jervis, to whom were the proceedings sent from India in the first instance?—The proceedings were remitted from India to the Judge Advocate-General's office here, according to the Articles of War.

206. On arriving here what was the course pursued upon that occasion?—To the best of my recollection what happened was this: His Royal Highness the Commander-in-Chief sent over for the proceedings to see them. Having perused them, he then sent over so much of the case as he thought fit for the opinion of the Judge Advocate-General.

207. Then the action took place through the Commander-in-Chief's view of the case, and not through the Judge Advocate-General?—Certainly. The case was finally settled when it came to England, and it was only a re-opening of the case.

208. I thought you stated before that the Commander-in-Chief in India has the power of confirming without any revision?—So he has, but in that particular instance the case was re-opened.

209 (*Mr. Russell Gurney.*) It was not the whole matter that was re-opened, but certain instructions were sent out?—Yes.

210. (*Mr. Mowbray.*) The Commander-in-Chief in India has the power to confirm or remit home?—Yes.

211. If he confirms the thing is finally concluded as far as law goes?—Yes.

212. Then after he has confirmed the proceedings are sent to the Judge Advocate-General to be deposited?—Yes, by the officer acting as Deputy Judge Advocate at the trial, or the Judge Advocate-General in India.

213. And then upon receipt of those proceedings the Judge Advocate-General communicates to the Commander-in-Chief a short notification of what has passed, stating that A. B. has been tried, and so on?—Yes, but not with a view to any further proceedings.

214. It is the duty of the Judge Advocate-General to bring under the notice of the Commander-in-Chief at home the proceedings that have taken place?—To that extent quite so.

215. Then the Commander-in-Chief may, if he pleases, send for those proceedings and ask any questions of the Judge Advocate-General with reference to those proceedings?—Quite so.

216. (*Lieut.-Gen. Peel.*) But in the first instance the Judge Advocate-General expresses no opinion to the Commander-in-Chief?—No.

217. (*Marquis of Hartington.*) Is it part of the Judge Advocate-General's duty even to read those proceedings?—No, they are considered finally settled.

218. (*Mr. Mowbray.*) They are finally settled unless there is an appeal?—There is practically that appeal, but really the whole thing is in form, and I think also in substance, advice given by the Judge Advocate-General to the Comanmder-in-Chief upon his requisition. In the case to which I refer we never advised upon the whole case; we were never asked to advise upon the whole case. In all those cases the Judge Advocate-General expresses no opinion except as he is requested by superior authority.

219. That superior authority, the Commander-in-Chief we will say, may ask the opinion of the Judge Advocate-General upon the whole case if he thinks fit, or he may confine his request to his opinion upon certain parts of the case?—Yes.

220. (*Chairman.*) When that case to which you have alluded came over from India and was deposited in the Judge Advocate-General's office, was it by the Commander-in-Chief's request, or by the suggestion of the Judge Advocate-General that it went over from the Judge Advocate-General's office to the Commander-in-Chief?—In that case the proceedings would be sent over to the Horse Guards upon a mere message received from them. It is a very common thing for the Horse Guards to want the proceedings of a certain trial, they send over to the Judge Advocate-General's office and get them, and return them. There is no doubt a note of their being sent out and of their return, but in a case like this the Commander-in-Chief would simply send to the Judge Advocate-General's office and ask for the proceedings.

221. (*Mr. Russell Gurney.*) Is it a fact that officers are occasionally dismissed the service without a court-martial?—Yes, that is by Her Majesty's prerogative. It is generally done in a quieter way; the officer is told that he must retire or else more severe measures will be taken with him.

222. As a matter of practice is that done without a court-martial when the officer requires a court-martial?—Nobody has a right to be tried by court-martial.

223. But as a matter of practice would a court-martial always be granted before an officer was dismissed if he demanded it?—I should say that that depended upon circumstances.

224. You think that as a matter of practice it would not occur often, and that in some cases the officer would be allowed to have a court-martial before he was dismissed?—It would very much depend upon the nature of the charge.

225. What would be the practice in the case of a charge, for instance, affecting the honour of the officer?—I have hardly had sufficient experience to answer you satisfactorily. It is admitted that it is the undoubted prerogative of the Crown to dismiss any officer without reason assigned, but it is not usual to exercise the prerogative without grave cause. In cases where a court-martial seemed to be a proper tribunal for examining the charge, supposing it was a definite charge, no doubt the court-martial would be granted; but supposing an officer, though he had never committed any great crime, was a thoroughly worthless officer and man, and it was desirable to get rid of him; you could not try him on any definite charge, and yet you must, for the benefit of the service, get rid of him. In that case I have no doubt that if he demanded a court-martial it would be refused.

226. (*Lieut.-Gen.-Peel.*) If an improper person commanded a regiment he would be removed if necessary without court-martial?—Quite so.

227. (*Lieut.-Gen.-Eyre.*) You have mentioned that the Royal Artillery are placed in the same position as the Guards with regard to courts-martial, and you stated that artillery officers can only be tried by their own corps, is that so?—The words are a little vague; they are these, "the officers of artillery shall "for differences arising amongst themselves, or in "matters relating solely to their own corps, have "court-martials composed of their own officers." No doubt in practice artillerymen are often tried by a mixed court.

228. (*Mr. Whitbread.*) Is it not the practice sometimes to sentence men to solitary confinement?—Yes, there is a provision made for that, with a limit appointed for the solitary confinement, in the 126th Article of War.

229. If the man is to be discharged from the service it is also customary to send him to a civil prison to have that sentence carried out, is it not?—Yes, that is so by regulation.

230. Are there any means in the civil prisons of carrying out a sentence of solitary confinement, is it a punishment known in civil prisons?—I cannot tell you that.

231. (*Chairman.*) You mentioned in the course of your evidence that a general court-martial could only award imprisonment for two years; that court-martial

V. Lushington, Esq.

23 March 1868.

can award a punishment of penal servitude, can it not?—A general court-martial can do so.

232. For what period?—For any period whatever, but it is limited in this way, it must not be for less than five years; that is in consequence of the Penal Servitude Act.

233. That is under an Act of Parliament is it not?—There is a Penal Servitude Act which says that no sentence of penal servitude shall be less than five years, and that is incorporated in the Mutiny Act.

234. (*Marquis of Hartington.*) You mentioned that it was difficult to draw a distinction in some cases between civil and military crimes, and that crimes which are really properly civil are sometimes treated as military crimes; with whom does the decision rest whether a crime is military or civil, and whether it should be tried by court-martial or by a civil court?—If a man commits an offence he is brought before his commanding officer. Supposing that it is an attempt to murder a comrade, that is an offence under the Articles of War as being a felony, and the commanding officer may then apply to the general officer to try him by district court-martial if he likes. If the general officer thinks fit to make the order the man may be tried and sentenced to two years' imprisonment, but he cannot be sentenced to anything more. On the other hand if the general officer thinks that the prisoner ought not to be tried by a military court, but ought to be handed over to the civil power, he then gives the necessary order for that purpose, so that in a case of that kind it would be no doubt the general officer who would determine the point.

235. Is the Judge Advocate-General ever consulted whether a crime should be treated as a civil or as a military crime?—Certainly; I can remember an application being made to the Judge Advocate-General as to his opinion whether a man should be tried for attempting to murder his officer. That was more than a mere felony, that was a capital offence under the Mutiny Act, so that the military authorities had the necessary power of punishment in their own hands without handing the man over to the civil power.

236. (*Lieut.-Gen. Eyre.*) But a commanding officer may hand a man over to the civil power for a civil offence immediately?—Certainly; but men who steal from their comrades are almost invariably tried, I should say, now by courts-martial; that is under the 81st Article of War.

237. (*Lieut.-Gen. Scarlett.*) But generally speaking would you not say that offences which were not purely military must be tried by the civil power, such as murder or assault on any of the inhabitants?—It would be so generally as a matter of fact, certainly.

238. (*Marquis of Hartington.*) But the civil authorities have the power of course if they think an offence has been committed which ought to be tried by a civil court to demand that it be so tried?—Yes, there can be no doubt of that; that is provided for by the 76th section of the Mutiny Act. For instance, two men who had murdered their officers within the last five or six years were each of them tried before the civil tribunal.

239. (*Viscount Eversley.*) Was there any previous inquiry before a coroner which justified the claim of the civil authorities to deal with the prisoners?—I am not sure, but I think so; I am pretty sure that there was a coroner's inquest upon Captain De Vere, who had been murdered by a soldier.

240. (*Chairman.*) Have you any suggestions to offer to the Commission for an improvement, either in the constitution or in the practice of courts-martial?—I feel considerable reluctance in answering that question, because I am a civilian; I only see these things on paper; I only partially see how they are worked, and then there are paramount considerations of military discipline of which I am an insufficient judge.

241. In the course of your experience in the office of the Judge Advocate-General have any complaints been made, or have you heard of any complaints of the practice or constitution of courts-martial?—We have had special complaints from time to time from persons who have been tried.

242. Of what nature are the complaints which you have heard?—I should think generally they were complaints of having certain questions refused, and sometimes of taking evidence which ought not to be taken.

243. Has that been in the way of a formal appeal to the Judge Advocate-General?—No; according to my view there is no formal appeal to the Judge Advocate-General.

244. In what form then have such complaints come under your notice?—Take Paymaster Cunningham's case for instance, he made many complaints at his trial. He afterwards had an adviser of the name of Mr. Tayler, who I think wrote to the Secretary of State for War, and wrote also to His Royal Highness. Those letters were in due time submitted by the Commander-in-Chief to the Judge Advocate-General, and in that way we took cognizance of them.

245. Were those complaints of what occured during the course of the trial and not against the system?—Persons cannot complain against a system, they are obliged to submit to that whatever it may be.

246. I understand you to say then that you are not able to advise this Commission as to any alteration in the practice of courts-martial?—I would not say that; but I should wish it to be borne in mind that I am a civilian, and that I admit that considerations of military discipline, which I am imperfectly acquainted with, must be paramount in determining the wise course. I must also add that a great majority of trials by courts-martial are from their simplicity perfectly right. Almost all crimes are simple, but military crimes are especially simple. The procedure in a great majority of cases works right results; but I think as soon as you get to a difficult case, and especially to the trial of an officer, the system then begins to be inadequate to the work required of it.

247. In what way?—In several ways, but I think one point of the greatest importance is the delay. If an officer is tried on a heavy charge, his case generally lasts a long time. For instance, I may mention Captain Jervis' case, which lasted a month. I think that in the case of each of the officers who were tried in Jamaica the trial lasted two months. Paymaster Cunningham's case also occupied a long time. I think that you will find that the protracted nature of a trial by court-martial in particular cases requires great consideration. That arises in a great measure from the system of procedure which I have described. It arises from the system of written addresses and written questions. Of course the difference in point of time between asking a witness a direct question *vivâ voce*, and writing it down and handing it up to the president who reads it, and then hands it to the officiating deputy judge advocate who writes it down, is enormous.

248. Have you any knowledge of the origin of that practice?—I have no knowledge of its origin, but I conjecture the reason of it. The reason of it is that there must be a full record of the proceedings for the confirming officer.

249. (*Mr. Russell Gurney.*) That you would have with a shorthand writer?—You would.

250. (*Chairman.*) Do you think it necessary to continue that practice now that the proceedings of courts-martial are taken down by shorthand writers in the same manner as they are in courts of civil law?—Where there is a shorthand writer I think that system is of no use at all, but is a mere incumbrance.

251. With regard to district courts-martial and regimental courts-martial, the shorthand writer is not necessarily present?—No, there is no shorthand writer. In fact, you never do have a shorthand writer without the special permission of the Secretary of State for War, because it is a matter of expense.

252. Do I understand you to say that it is not absolutely necessary that a shorthand writer should be present at a general court-martial?—Certainly

not. There is a provision in the Mutiny Act that a shorthand writer may be employed, but he cannot be employed without the special authority of the Secretary of State of War.

253. Is it your opinion that it would tend to shorten proceedings in courts-martial, regimental, district, and general, if the same rule applied to all three, that a shorthand writer might be employed?—No doubt it would save time, but it would be a question of expense in regimental and district courts-martial, and I think that there is not the same necessity for it, because there the cases are so simple.

254. (*Maj.-Gen. Horsford.*) Would you then allow every member to ask a question, or must every question go through the president?—I think the majority of questions would always be asked by the prosecutor and the prisoner. The court would have the supplementary power of asking any questions which it thought necessary.

255. (*Lieut.-Gen. Scarlett.*) Do you see any advantage at all in the present system when a shorthand writer is present?—I see no advantages and I think there are great disadvantages, for instance, the efficient power of cross-examination is destroyed.

256. (*Mr. Russell Gurney.*) The power to have shorthand writers is not confined to general courts-martial, is it?—It is not; I think that you will find that the great majority of trials by courts-martial are disposed of in a single day, even in the case of district courts-martial; and therefore the matter of saving an hour or two is not of much consequence; but when you come to a heavy case, like Captain Jervis' case or that of the officers in Jamaica, or Paymaster Cunningham's case, the present system entails an enormous delay. Among other things you have to ask the opinion of the court upon the evidence at the expiration of a month, or possibly when it is returned by the revising officer at the expiration of six weeks, and of course this makes great difficulties in arriving at a proper result.

257. (*Lieut.-Gen. Eyre.*) You would not like to give an opinion upon the practice of regimental courts-martial?—No, I would not.

258. (*Mr. Mowbray.*) Do you not think that the number of 13 is unnecessarily large for a general court-martial?—It seems to me unnecessarily large, but it is really a military question.

259. It is proposed to alter it in an Act of this year, and to reduce it to nine; what will be your view as to such an alteration?—I think that would be a good alteration.

260. In the Jamaica trials we were only authorized to employ seven, and we found those cases as well tried as any others?—Quite so.

261. (*Chairman.*) In the Jamaica case what was the authority for sending out seven officers instead of 13?—The Articles of War.

262. By which Article of War was that?—The 106th, which enabled a general court-martial in Jamaica to consist of seven officers.

263. (*Lieut.-Gen. Peel.*) But there was this peculiarity about that, that the members of the court were sent out directly from England, and that they were not selected from officers upon the spot?—That was so.

264. (*Mr. Mowbray.*) With regard to the kinds of courts-martial, it has been suggested that one kind should be done away with; what would be your view upon that point?—At present you may take it that there are only three kinds, the general, the district, and the regimental courts-martial. I speak with deference to military authorities, but it seems to me that many private soldiers who are tried by general courts-martial might be tried by district courts-martial with convenience, and that it is not really necessary to resort to a general court-martial unless the offence requires such a sentence as can only be passed by that tribunal. I think that that would get rid of a number of general courts-martial which are of the most ordinary kind.

265. (*Maj.-Gen. Horsford.*) Have you not found that that has been done very much of late years?—It has.

266. (*Mr. Mowbray.*) Would it not be desirable that there should be some classification of offences, and that it should be more distinctly defined what offences are cognizable by general courts-martial, and what by district courts-martial?—I think such a classification very desirable, but it would require much consideration. Thus striking an officer is of course one of the gravest offences which a man can commit, yet under circumstances it might be proper to try the offender by district court-martial only. Striking a non-commissioned officer is a capital offence under the Mutiny Act, but I think that most officers would have a case of that kind tried by district court-martial.

267. Would it not be desirable that there should be some authority in London which should decide by what court-martial offences of that dubious character should be tried?—Yes. My own view would be (but I mention it with deference) that no general court-martial should be held without the sanction of the Commander-in-Chief. It seems to me that district courts-martial might deal with the great majority of the cases.

268. Then in every case of a general court-martial application should first be made to the Adjutant-General for the sanction of the Commander-in-Chief?—Yes.

269. (*Maj.-Gen. Horsford.*) What would you do abroad, in the West Indies, for instance?—A general court-martial would be held there as at present by the order of the general officer on the spot.

270. (*Mr. Mowbray.*) With respect to the preparation of the charges, is it not an objection at present that charges for a general court-martial have to be prepared at the Judge Advocate-General's office, and that if objections are taken to the form of those charges the Judge Advocate-General has himself to decide whether those charges are or are not good?—Yes. It is no doubt of consequence that the charges should be carefully settled by legal authority, and therefore by some such authority they must be settled; but the present practice is no doubt open to the observation that the Judge Advocate-General at first settles the charges, and then, if any case arises upon the trial as to the validity of those charges, his opinion is asked upon them. In fact, as settling the charges he acts as prosecutor.

271. Would it not be advisable to attach to the Adjutant-General's office, or to some other department in London, an officer who might act as a "clerk of indictments" to frame the charges, so that the Judge Advocate-General might afterwards approach the matter with a practically unbiassed and unprejudiced mind?—I think that it would be very advisable. I also think it is of some consequence that the duties of the prosecutor should be more clearly defined, and that especially he only should be charged with the prosecution; that he should be charged to have the necessary witnesses in attendance, and that he should be charged with the proper examination of them.

272. (*Chairman.*) To whom would you recommend that the authority should be given to appoint the prosecutor?—I think the convening officer would be the proper person to name the prosecutor; but usually it might be convenient in a district court-martial to have the adjutant of the regiment, and in a general court-martial to have the commanding officer of the regiment, as the prosecutor. I do not see that a strict rule would be necessary, but probably that would be found a convenient arrangement, as they are the officers in charge and know all the circumstances.

273. (*Mr. Mowbray.*) Is it not a highly objectionable practice that the witnesses should be selected to act as prosecutors?—It is a most objectionable practice.

274. Is there not a recent instance in which a witness has appeared as prosecutor, and has afterwards given evidence, not upon oath, in his reply as prosecutor?—I believe that was so.

275. Is not that a very strong illustration of the

V. Lushington, Esq.

23 March 1868.

objection?—I think that it is very strong indeed; I think that it is impossible for an officer in such circumstances to fulfil his duty properly, either as witness or prosecutor.

276. (*Chairman.*) You think that the prosecutor should be appointed so that he can conduct a case in the same way as if the prosecution took place in a civil court?—Yes, because he can ascertain the nature of the case beforehand. At present nobody is charged with that, and to some extent it is thrown upon the court at the time of trial, which seems to me to be open to objection, because it places the court in the position of prosecutors.

277. (*Mr. Mowbray.*) Is it not sometimes the case that when a witness appears as prosecutor he is examined by the person who ought to occupy the most impartial position, namely, the acting Judge Advocate?—That was so in one case.

278. (*Lieut.-Gen.-Eyre.*) Do you think that the prisoner ought to have more protection than he has at present from the Deputy Judge Advocate?—I do not think that the prisoner ought to have more protection than he has at present from the Deputy Judge Advocate. Whether or not he ought to have further assistance is, I think, a grave question, but I am not prepared to offer any direct proposal, unless it be that an officer of the prisoner's regiment, or of his company, should always attend on his behalf.

279. (*Mr. Russell Gurney.*) Do you think that the system works well of having a person who is not a member of the court with authority upon all points of law superior to that of the president of the court?—Of course their relative positions are very different from those of a judge and a jury, and the position of the Judge Advocate being so distinctly inferior to that of a judge he loses so much power, but at the same time I think that it has proved of very great advantage that the court should be attended by an officer who has given special attention to the law and has paid special attention to trial by court-martial.

280. He is himself in many or in most cases probably a person of inferior rank to the president of the court-martial, is he not?—I should think so, generally.

281. Do you think that it works well that the president in conducting the proceedings should be entirely overruled by a person of inferior rank who is not himself a member of the court?—I think certainly that the Deputy Judge Advocate should have higher army rank, but whether his rank is higher than or inferior to that of the president I think that it is of great importance that his opinion should be treated as conclusive.

282. (*Chairman.*) What is the rank of a Deputy Judge Advocate?—It differs; in India he is a captain or a major, here they are generally full colonels.

283. (*Mr. Russell Gurney.*) In India it would frequently happen, would it not, that the Deputy Judge Advocate was not only of inferior rank but was of very much less experience than the president of the court-martial?—It does from time to time happen, and formerly when the Deputy Judge Advocate was a kind of prosecutor he was treated as quite an inferior officer, but now he has much more important duties attached to his office, and he has proportionate rank with the court, for instance, he sits on the right hand of the president in the court in a position of honour.

284 (*Lieut.-Gen. Eyre.*) I suppose that it is a very useful appointment?—It is an excellent appointment I think. There has hardly been a single miscarriage on a point of law since the appointment of the district Deputy Judge Advocates and they have undoubtedly saved many a court from falling into error.

285. (*Mr. Russell Gurney.*) You do not think that the dual authority works ill?—No; I should say that it works well, but it requires the Deputy Judge Advocate to have considerable forbearance.

286. And the president must have great forbearance too, must he not?—Yes. There have been some difficulties, but they have not been of great consequence.

287. (*Lieut.-Gen. Peel.*) What special rank has the Deputy Judge Advocate?—He ranks as an Assistant Adjutant-General.

288. (*Lieut.-Gen. Scarlett.*) What do you consider to be the special duties of the president of the court?—He is the chief member of the court, and he is co-responsible, if I may say so, with the Deputy Judge Advocate for the proper conduct of the proceedings. He is undoubtedly the chief person responsible for the finding and for the sentence.

289. (*Mr. Russell Gurney.*) But his questions may be overruled by the Deputy Judge Advocate, may they not?—I can only tell you what the Queen's Regulations say, they say that the opinion of the Deputy Judge Advocate "ought to be conclusive." It is worded in rather a guarded manner.

290. (*Lieut.-Gen. Scarlett.*) That is simply upon questions of law, is it not?—Yes.

291. (*Mr. Mowbray.*) Although the military rank of the president may be greater than that of the acting Deputy Judge Advocate, yet that difference of rank may be counterbalanced, may it not, by the authority acquired by greater legal knowledge and special education?—Quite so.

292. It is the special function of the Deputy Judge Advocate to be cognizant of the forms of procedure of courts-martial and to deal with offences against military law and their punishments, is it not?—Yes.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Room E., House of Lords.

Thursday, 26th March 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
THE RIGHT HON. RUSSELL GURNEY.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
SAMUEL WHITBREAD, ESQ.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

Major-Gen. Rumley.

26 March 1868.

MAJOR-GENERAL RANDAL RUMLEY called in and examined.

293. (*Chairman.*) I believe you have held several posts in the army which have enabled you to form a judgment upon the nature of the military tribunals of this country?—I have.

294. Will you state what posts you have held?—After commanding a battalion I was sent to a depôt battalion at Parkhurst. I was then appointed to a brigade at Malta, and subsequently removed to

Gibraltar; I then became inspector-general of infantry; and that was my last post.

295. In all those posts your attention had to be directed to the subject of courts-martial?—Undoubtedly.

296. Have you any suggestion to offer to the Commissioners; first of all taking the constitution of the tribunal which, in your opinion, would tend to an improvement of the tribunal in its constitution?—I have not.

297. Do you think with regard to general courts-martial that the number to which they are now limited, namely, thirteen, is the best number?—Without experience of a different number it is rather a hazardous opinion to offer.

298. Have you ever found any inconvenience in constituting a general court-martial from being obliged to fill it up to the number of thirteen?—Not where I have been quartered or stationed.

299. Have you heard in any other branch of the service of any inconvenience arising from that circumstance?—There are certain stations, I believe, where the number may be less than that; I think that is provided for by the Mutiny Act.

300. Could you state from memory which those stations are?—I could not.

301. They are in the colonies, I presume?—Yes.

302. Have the tribunals so constituted the same powers as the court of thirteen?—Quite.

303. Have they powers of life and death?—Yes.

304. And of every other punishment?—Yes.

305. With regard to the prosecutor before general courts-martial, how is that prosecutor appointed?—By the Commander-in-Chief in England.

306. And in our colonies how is the prosecutor appointed?—By the officer commanding at the station.

307. He has the power to appoint any officer he likes to act as prosecutor in any case which comes before the court?—Certainly.

308. What is the usual rank of the officer who is appointed?—He is generally a field officer.

309. Has he the case submitted to him in full before he commences his duties?—I apprehend so.

310. Upon whom does he rely in the conduct of his case; does he exercise his own judgment uninfluenced by any other person?—I should say so.

311. Entirely independently?—I should say so.

312. At what period does he address the court on behalf of the prosecution?—He opens the proceedings by an address.

313. In that address does he state the whole of the circumstances which he will have to bring before the court?—Yes.

314. Does he give a list of the evidence?—Yes.

315. Is he obliged at any period of the proceedings to deliver to the prisoner a list of his witnesses or a statement of the nature of the evidence?—Certainly; before the trial.

316. How long before the trial?—At least 24 hours.

317. He must give to the prisoner a list of the witnesses and the nature of the evidence to be adduced against him?—Yes.

318. The charge of course is given?—Of course.

319. How long before the trial must the charge be given?—It must be at least 24 hours; I do not think that any thing is specified in the Act to that effect.

320. The examinations of witnesses in chief, as we have heard, is conducted by written questions and answers?—I think that was not the practice.

321. Is it not the practice to put down the question for the prosecution?—The charge having been read over, in the hearing of all the witnesses summoned to give evidence on the court-martial, the first witness is called in and asked what he has to state relative to the matter; and he delivers himself of what he knows upon the subject.

322. But supposing that it happens that the prosecutor is not satisfied with the extent to which the witness has gone and wishes to ask further questions, are these questions given verbatim or put down in writing?—They are put down in writing.

323. And I believe that all the questions for the defence are also put down in writing?—Yes.

324. Is it your opinion that it is necessary to carry on that system under the present state of things?—You certainly might save the time of writing the questions, but I do not see that you would save anything else.

325. But do you think that now that shorthand writers are admitted before courts-martial there is a necessity any longer for continuing the practice of putting down the questions and answers in writing?—I think not, provided he is available to read them.

326. You do not think that justice would in any case fail from such a proceeding?—I cannot see how it should.

327. Do you recommend that shorthand writers should be admitted before any other court-martial than general courts-martial?—I do not see what advantage you would gain by it.

328. But is there not an evident advantage in getting the evidence taken down with as little delay as possible?—If there is any inconvenience it must be solely to the members of the court. I do not think that substantial justice is affected at all by the questions and answers being written

329. But are not the proceedings of the court very much lengthened by the necessity of putting down the questions and answers in writing?—Doubtless, so far as the number of questions goes, by the amount of time you would take in the writing.

330. But do not the expenses of a trial by a court-martial depend very considerably upon the speed or delay with which the proceedings are conducted?—I am not aware of any expense attendant on courts-martial.

331. In the case of a prisoner, for instance, in his defence having to take the best advice he can get, may not his expenses be very materially increased if in consequence of the slowness of the examination the court may be adjourned from day to day?—I have never during my experience found any inconvenience or delay from this cause.

332. (*Lieut.-Gen. Scarlett.*) If you had to pay a counsel for that time day by day, would it not increase the expense?—Certainly, just in proportion to the time occupied by writing the questions, but that time only.

333. (*Chairman.*) But is not every delay in a court-martial a cause, first of all, of increase of expense in the court, and next is it not an increase of expense to the prisoner tried?—Of course where the prisoner has a legal adviser to defend him; in such cases it would add to the expense, but they are rare.

334. Does it not sometimes happen that an officer who is tried has to bring a great number of witnesses from a great distance?—It might be so.

335. Has he not to pay the expenses of those witnesses?—I believe that depends upon the finding of the court.

336. But does it not frequently happen that an officer tried by court-martial is put to very heavy expenses from the number of witnesses whom he has to bring?—It might be so, certainly.

337. In that case any delay in the proceedings of the tribunal must, of course, be of very serious consequence to the prisoner?—Doubtless, as regards expense.

338. With regard to district courts-martial you say you do not see any objection to a shorthand writer being admitted, but you do not see any benefit from it?—I do not.

339. In a regimental court-martial I presume it would increase the expense very materially to admit a shorthand writer?—Certainly.

340. In your experience do the generality of regimental courts-martial last more than one day?—No.

341. They generally commence and terminate the same day, do they not?—They do.

342. With regard to the defence of the prisoner, could you assign to the Commission the cause why a

Major-Gen. Rumley.

26 March 1868.

prisoner is not entitled to be heard by his legal adviser before a general court-martial, seeing that the prosecution may be carried on by a person appointed by the commanding officer of the district?—The prisoner can have a legal adviser if he wishes.

343. But may that person address the court?—No.

344. Can you assign any reason why the same privilege should not be given to a prisoner of addressing the court which is given to the prosecutor?—As a rule, I think that in any difficult case the prisoner would avail himself of the services of a legal adviser, and I think that if he were permitted to address a court of officers who are not acquainted with the law very intimately he might feel disappointed if his address had not the desired effect. At the same time I do not think it would weigh very much with officers. The prisoner has the privilege of addressing the court, as well as the prosecutor.

345. Is a legal person never employed for the prosecution?—I have been on a court-martial where a legal officer was appointed from the Judge Advocate-General's Office.

346. (*Lieut.-Gen. Scarlett.*) As Deputy Judge Advocate?—In addition to the Deputy Judge Advocate.

347. Not as prosecutor?—No; he was a legal adviser assisting the prosecutor.

348. (*Mr. Mowbray.*) Sometimes there are legal gentlemen employed to assist the prosecutor, are there not?—Yes.

349. And sometimes also the prisoner is assisted by a legal adviser?—Sometimes.

350. (*Lieut.-Gen. Scarlett.*) Have you ever seen any one employed to assist the prosecutor independently of the Deputy Judge Advocate?—The Deputy Judge Advocate General has assisted the prosecutor.

351. (*Mr. Headlam.*) Have you ever seen any legal gentlemen address the court on either one side or the other?—No.

352. (*Chairman.*) Does the Deputy Judge Advocate address the court for the prosecution if he is the prosecutor?—I think not.

353. Do you see any objection to the prisoner's being allowed the same privileges in his defence that are enjoyed by the prosecutor, that is to say, that he should be enabled to select any friend of more ability than himself to defend him, and to address the Court in the same way as the officer for the prosecution does?—He can do so, provided he is not a legal adviser.

354. (*Mr. Headlam.*) Is it the case at present that the prosecution can obtain the aid of any civilian to address the court?—No.

355. Any friend may advise the prosecution?—Yes.

356. And any friend may advise the prisoner?—Yes.

357. So that at the present moment there is no distinction, as I understand it, between the prosecution and the prisoner?—No.

358. (*Chairman.*) Is there not this distinction, that the officer conducting the prosecution is enabled to address the court, whereas the friend of the prisoner is not allowed to address the court?—There is that distinction.

359. The object of my question was to ascertain whether you think it necessary to keep up that regulation?—I do not see any particular object in preventing the prisoner from having the same advantage as the prosecutor has.

360. (*Lieut.-Gen. Peel.*) But the prisoner can read any address prepared for him by his friend, can he not?—Certainly.

361. (*Chairman.*) The prosecutor cross-examines the witnesses, does he not?—Yes.

362. *Vivâ voce*?—*Vivâ voce*, or by questions through the president; that is the more usual way.

363. Has the prisoner any power of that kind?—Yes.

364. Can he *vivâ voce* cross-examine the witnesses?—Yes, or by questions through the president, which is the usual way; that is to say, he puts his question *vivâ voce* through the President, and then it is written down and answered.

365. (*Mr. Mowbray.*) Those are questions suggested by himself to the president?—It may be so.

366. (*Chairman.*) But questions may be also suggested by his friend, who may be a legal adviser?—Yes.

367. (*Lieut.-Gen. Eyre.*) With reference to that particular point, would it, in your opinion, be desirable to have a specific rule as to some particular party attending to watch the proceedings on the part of the prisoner; for example, an officer of his company, where the Captain was not the party who prosecuted (that would be a matter, of course, for detail and consideration); but should you not have a fixed rule laid down, there being at present no rule?—As a rule, I think it is the duty of the President to watch the case, not only for the prosecution, but also for the prisoner.

368. (*Mr. Headlam.*) Is it the case that at this present moment neither the prosecution nor the prisoner can have the benefit of any counsel?—Not to speak.

369. Do you think there would be any objection to allowing the some privilege to both; that is to say, to allowing the prosecution to be conducted by a civilian, and to also allowing the prisoner to be defended by a civilian?—I think you would very much increase the expense, which was the objection suggested just now with regard to writing down the questions in courts-martial.

370. But supposing the prisoner wished it, and the case was a difficult one, do you see any other objection to it than that it might in some respects add to the cost of the trial?—In my opinion they would do better without it.

371. Supposing then that the prosecution were in the hands of a military man, you would not allow the prisoner to be defended by counsel?—I did not say that.

372. But would you allow it?—Yes, I would, as at present.

373. But to be defended by counsel speaking?—No, not speaking.

374. (*Lieut.-Gen. Scarlett.*) Not addressing the court?—No.

375. (*Mr. Headlam.*) What objection have you to counsel addressing the court?—I think I have already stated that the court is not composed of lawyers. It is a court of officers, who are certainly bound to be acquainted with whatever is contained in the Mutiny Act and the Articles of War, but when there comes any special pleading, which is, more a lawyer's profession than that of the officers, I think it would not further the ends of justice at all. I have never found that substantial justice has not been done by the present mode so as to show the necessity for this interference.

376. Supposing the prisoner is defended by counsel who are not allowed to speak, any legal point can be raised?—Certainly.

377. Do you think it not desirable that the counsel should answer that point?—He can put it through the prisoner. The prisoner may say anything he likes, or the counsel may write down anything for the prisoner to read.

378. That is, if the court is defective for adjudicating legal points?—I did not say that it was exactly defective for adjudicating legal points. I said they were only supposed to be acquainted with the Mutiny Act and the Articles of War; and if other points were introduced which are not contained in those, I think it would be a pity, and only complex matters.

379. But your opinion is that it would be desirable that those legal points should be raised by counsel, but that it is not desirable that counsel should speak upon them?—I think that if they are raised by counsel it is desirable that they should come through the prisoner.

380. (*Mr. Mowbray.*) You say that the prisoner

can read an address which is prepared for him by another person?—Certainly.

381. Do you not think that the force of an address is very much weakened by being read by an illiterate man, a private soldier, instead of being read by the person who has prepared it?—I have no doubt that the person who wrote the address would think so, even if it had to be delivered by an officer.

382. If you object to the admission of a legal representative for the prisoner to speak or to read the address, should you object to any officer being selected to act as his friend and to read the address prepared for him?—No.

383. (*Lieut.-Gen. Peel.*) At present there are two parties before the court—the prosecutor and the prisoner—and they are at the present moment upon exactly an equal footing, either of them may be assisted by an adviser, but they have each of them the power of putting any questions that the adviser suggests to them; each has the power of addressing the court, and there is the Deputy Judge Advocate in order to see, as I may say, fair play between them as far as the law is concerned. I understand you to say that you do not think that though they may be perfectly competent to give an opinion upon martial law they would so well understand any legal question that might arise?—That is my view.

384. (*Mr. Mowbray.*) Do you think the prosecution and the defence may be said to be upon an equal footing if the case for the prosecution can be stated by an officer, an educated gentleman, who has prepared the speech himself with which he addresses the court, and if, on the part of the prisoner, the prisoner, an illiterate man, has to read an address prepared for him by some one else, and is not to be represented by an educated man?—The matter being committed to paper and before the court, they can as well judge and interpret the meaning of it as anybody else; and I think the prisoner is upon an equal footing with the prosecutor.

385. Do you not think that the effect of the matter may very much depend upon the way in which the argument is addressed to the court?—It may be so, but I do not think that it affects the justice of the case.

386. (*Lieut.-Gen. Eyre.*) Would not such an arrangement be very unacceptable to the army; would they not consider rather a doubt to be thrown upon their justice and honour in conducting the soldiers' courts-martial?—I think it seems rather a reflection upon their competency to understand the Mutiny Act and Articles of War.

387. (*Mr. Whitbread.*) Do you think that no prisoner would like to have his case conducted *vivâ voce* by his friend or his legal adviser, if he had the option given him?—I dare say he might; some might and some might not.

388. (*Lieut.-Gen. Scarlett.*) Do you think that the prisoner loses any advantage now from not having a counsel to plead for him?—No, I do not.

389. Do you think that full justice is done to the prisoner?—I think so.

390. And that justice is done without the address of a counsel?—I think so.

391. (*Mr. Headlam.*) In the case of an important and difficult trial, such as the case of the trial of an officer for conduct unbecoming an officer and a gentleman, do you think that the court is competent to decide without the address of any counsel or skilful man on behalf of the prisoner?—They have in my experience decided on such case justly, without such an address.

392. (*Chairman.*) You do not suggest any alteration in that particular?—I do not.

393. Do you think that any alteration would be unadvisable?—I think that by the present mode substantial justice is done to the prisoner, and therefore I do not advise any alteration.

394. (*Lieut.-Gen. Scarlett.*) Do you consider that in a general court-martial the prisoner is at all under the protection of the Deputy Judge Advocate; do you consider that it is the duty of the Deputy Judge Advocate to watch over the case, and to prevent any injustice done to the prisoner?—I do most assuredly.

395. And that is the practice?—I consider it so.

396. (*Mr. Mowbray.*) And you think that would be as efficient for the protection of the prisoner as his having legal advice?—I think so.

397. Or the assistance of a legal gentleman to prepare the defence?—That is permitted now, provided that he does not address the court.

398. (*Mr. Russell Gurney.*) The Deputy Judge Advocate of course knows nothing of the prisoner's case until he hears it at the trial?—Not of necessity.

399. But that is necessarily so, is it not; he would not be entrusted by the prisoner with the nature of his defence, would he?—I do not know why he should not, if the prisoner so desired it.

400. He is to maintain an entirely impartial position, and as far as he can consistently with that, he is to take care that no injustice is done to the prisoner. Do you not think that a person who is in the confidence of the prisoner, and who is entrusted by him with the nature of his defence can watch over his interests much more effectually than a person who is ignorant of them?—Surely.

401. (*Mr. Headlam.*) At the present time all the proceedings of the court are put down in writing, are they not?—That is the case.

402. And you see no objection to that in practice?—I do not.

403. The document containing this record of the trial is afterwards forwarded to the Judge Advocate-General's office, is it not?—It is.

404. And the Judge Advocate-General has in consequence the opportunity of revising the proceedings which take place at the trial. Supposing that the evidence was not taken down, and that the questions were not recorded, the Judge Advocate-General would have no power of revising the proceedings afterwards, would he?—I should think not.

405. Consequently if there were any improper question asked at the trial, and there were no record of it, the Judge Advocate-General would not be aware of the impropriety of the question which had been put?—He would not.

406. So that if any injustice were done to the prisoner by the fact of any cross-examination being stopped, the Judge Advocate-General would not be able to judge of that?—No.

407. So that unless there is some complete record of the trial, no advantage arising to the prisoner from a complete revision of the proceedings could possibly be obtained?—No.

408. Do you not think that a matter of considerable consequence?—Certainly.

409. (*Mr. Whitbread.*) Upon the subject of taking down questions, is there not a very great latitude allowed to witnesses to alter the first answer which they give *vivâ voce* to any question before it is finally taken down and reported as part of the proceedings?—There is no very great latitude given.

410. They are allowed to amend the answers to the questions, are they not?—If they do not perfectly understand the question; if they give a vague answer, the question is perhaps read again to them, and they are at liberty to correct what they have said. If they had not a correct apprehension of the question, on its being repeated they are at liberty to correct what they have said under misapprehension.

411. Then the first answer would not appear upon the proceedings, but the corrected answer would?—By the regulations it should be all written down.

412. As a matter of practice is it so?—As a matter of practice it should be all written down.

413. (*Lieut.-Gen. Peel.*) By whom are the answers taken down in writing?—There is generally an officer deputed by the president to write the proceedings, and it is his business to do it.

414. If there was a shorthand writer he would perform that duty?—I presume so.

Major-Gen. Rumley.

26 March 1868.

415. You say that the prisoner reads an address which is prepared for him, does that appear upon the proceedings?—Yes, and it is attached to the proceedings and signed by the president.

416. And as far as the revision of the proceedings by the Judge Advocate-General is concerned, when it comes to him it does not matter whether it was read by one person or another?—Not in the least; I think I stated that each member of the court has the opportunity of reading it and putting his own interpretation upon it.

417. (*Mr. Whitbread.*) Is it not your opinion that the power of efficient cross-examination is very much diminished by the slow process of having to put down every question in writing and to take down the answer?—My experience of courts-martial does not lead me to that opinion.

418. (*Mr. Mowbray.*) You say that each member of the court has an opportunity of reading the prisoner's defence, do you mean that where a general court-martial consists of thirteen officers they would be likely to take time to read and consider the prisoner's defence?—They have each the opportunity so to do.

419. They have the opportunity, but as a matter of fact what is the practice?—As a matter of fact, I think that they take it in as it is read; but if it is a very difficult question, any member of the court would say, "I do not exactly understand what has been read "out, and I will just satisfy myself upon the point "by reading the document."

420. Then although as regards the Judge Advocate-General, the effect of the address upon the Judge Advocate-General in revising the proceedings would depend upon the matter of the address, as regards the court the effect would rather be produced by the manner in which the address might be delivered, would it not?—I think not.

421. With respect to the shorthand writer do you think there would be any difficulty in finding soldiers in the army who might be trained to shorthand writing, so that you might have shorthand writing in the regimental courts-martial?—I never practised shorthand writing, and I do not know what the difficulties attending the acquisition of it are.

422. (*Mr. Russell Gurney.*) You said that a list of witnesses had always to be furnished to the prisoner at least 24 hours before the trial commenced; can any witnesses be called who are not included in that list?—Not unless notice is given to that effect.

423. I mean unless he gives notice 24 hours before the trial?—I think that if the witnesses were upon the spot, and the prisoner almost at the last moment thought that he would like to have them he would be at liberty to call upon them.

424. But supposing that the prosecutor receives information in the course of the trial of witnesses who might be important, is he forbidden calling them in consequence of their not having been included in that list?—I should think not.

425. Then the list is not binding upon him in any way?—No, it is not binding.

426. (*Lieut.-General Peel.*) The list of witnesses might be altered with due notice?—Yes.

427. (*Mr. Russell Gurney.*) What notice is that?—As much as they could conveniently give.

428. Supposing that it is in the course of the trial, they cannot give any notice?—Immediately the prosecutor is aware that he wishes to have any witness he notifies it to the president.

429. And he calls him at once?—He calls him at once if he is avilable.

430. Then there is no notice given to the prisoner?—Only that sort of notice.

431. (*Chairman.*) I believe that when the examination for the prosecution and defence is over the Deputy Judge Advocate addresses the court and sums up the evidence?—Yes.

432. Is that done in the presence of the prisoner?—Yes.

433. When the Deputy Judge Advocate has addressed the court, does the president of the court take any special part in the proceedings?—No.

434. How do the court proceed to deliberate upon what they have heard?—The court is cleared, and they deliberate and take the opinions of the several members.

435. Does the Deputy Judge Advocate remain in the room?—He does.

436. The prosecutor does not, I presume?—No, he does not.

437. Then is it not the custom that the opinion of the junior officer is taken in the first instance?—It is.

438. Is that as regards, not only the guilt or the innocence of the prisoner, but as to the punishment to which he shall be submitted in case he is found guilty?—The same in both finding and sentence.

439. You mistake my question. The junior officer gives his opinion first as to the punishment if the prisoner should be found guilty, does he not?—Yes the same course obtains in both cases as to opinion and as to sentence.

440. Do you know the origin of that custom?—I do not.

441. Do you know the reason of it?—I presume that it is supposed to be fairer towards the party under trial.

442. (*Lieut.-Gen. Peel.*) So that the junior officer should not be influenced by the opinion of his seniors?—Quite so.

443. (*Chairman.*) You do not recommend any alteration in that respect?—I do not know that I should recommend anything; if I did it would be that the opinions should be given from flanks to centre.

444. That is a very valuable suggestion. You think that if the system is altered at all, the opinions should be taken of first a junior and then a senior?—Yes, alternately; leaving the president the casting vote.

445. There are thirteen members constituting the court; does the president give his vote with the rest of the court?—Yes.

446. And then has he the additional vote which is the casting vote?—His is the odd or casting vote.

447. But supposing by any chance one member was absent, what then?—He is replaced.

448. Has the president then a double vote?—No.

449. But supposing that, through illness, the court is diminished to twelve; supposing that the opinions are equal, who has the casting vote?—That has never come under my experience; I do not think that I have ever known such a case.

450. Does it remain a valid court in case all the members are not present?—I should say not; the practice is to have more than the required number detailed for a general court-martial.

451. The number may come to 14?—Then I think the junior would not give an opinion at all; or if the opinions were equal, the prisoner would have the benefit.

452. (*Lieut.-Gen. Peel.*) Is it not the case that two extra officers are warned for duty in case of one being absent?—Generally.

453. (*Lieut.-Gen. Scarlett.*) And they attend and hear the evidence, do they not?—Yes.

454. (*Mr. Whitbread.*) Can a new member of the court be brought in in the case of the sickness of one of them without having heard the evidence?—No.

455. Then supposing that by sickness or some other cause the court is reduced below the equal number, what happens?—I have never known such a case, but there would be a fresh trial.

456. (*Mr. Mowbray.*) It is usually the case to constitute the court of a larger number of members than is required by the Mutiny Act and the Articles of War, is it not?—Yes, in the case of general courts-martial.

457. So that in the case of a general court-martial it frequently consists of 15 officers, whereas 13 is the legal number?—Yes.

458. And in that way provision is made, in the

case of absence or illness, to the extent of two, the court being still able to sit and come to a decision?—Quite so.

459. But in the event of their being reduced below 13 there can be no finding of the court?—No.

460. (*Chairman.*) When the numbers are by any chance reduced to an even number and the opinions are even, who has the casting vote?—If it came to 14 I think the junior member would retire; but if the votes were equally divided, the prisoner would have the benefit.

461. But under no circumstances would the senior officer have a casting vote?—If there were an odd number, his would be the casting vote.

462. Under those circumstances it cannot arise in a court-martial in your opinion that one officer of the court should have a double vote?—No.

463. Would you inform the Commission from your experience of courts-martial whether any large number of them have had their findings revised by the proper authority?—Yes, a considerable number of them.

464. Could you state in about what proportion such revision has taken place?—I should say about one-fifth.

465. In the cases which have been revised what should you say are the principal grounds of revision; was it want of proper finding or a want of proper punishment, or in what respect were they defective?—Sometimes one, and sometimes the other.

466. Which should you say was the preponderating effect upon which the decision of a court has been revised?—On the sentence, I think.

467. A sentence that, in the eyes of the authority, has been either inadequate or too great?—Yes. Perhaps in answering that question I should say that there are several points which really are of no importance. But I will give you an instance of one or two, and then the Commission will be able to judge, and see what I mean by revisions. If a soldier is tried for habitual drunkenness and is found guilty, the Article of War proceeds to say, that he shall be subject to a stoppage of a penny a day, and in addition that he is to receive any other punishment which the court is competent to award. Sometimes the court does not read this article very critically; they award the imprisonment before they add the stoppage. If I were the confirming officer, I should point this out, and direct the court to adhere to the Article of War, and there would be a revision.

468. (*Lieut.-Gen. Scarlett.*) That would be simply a re-writing of the proceedings and not a revision of their sentence?—That is all. But I mean to say that cases like that cause a revision.

469. (*Chairman.*) Have you any suggestions to make with regard to the revision of courts-martial?—None.

470. You think that it is advisable to continue the present mode of revision?—I think so.

471. Do you think that the present regulations as to the mode of revising the sentences of courts-martial are upon the whole more favourable to a prisoner tried than if he was invariably to be left to the decision of the court itself before whom he is being tried?—I do not quite catch the meaning of the question.

472. (*Lieut.-Gen. Scarlett.*) Does not the power of revision act both ways?—Surely.

473. It may be in favour of the prisoner or it may be against him?—Surely.

474. (*Chairman.*) Is the revision oftener in favour of the prisoner, or of the prosecutor?—I think it is oftener in favour of the prisoner.

475. (*Mr. Whitbread.*) Is there a power in the confirming officer to send back the sentence of the court for severer punishment?—Surely.

476. (*Chairman.*) Is that power often exercised?—No, I do not think it is.

477. But there is the power in the convening officer to refer the case back to the court for their consideration?—Yes.

478. (*Lieut.-Gen. Scarlett.*) What is the usual effect of a court not increasing the punishment where the confirming officer does not think it sufficient?—In some cases discipline would be affected thereby, but the sentence only can be inflicted.

479. But what is generally the practice?—In some cases they attend to his suggestions, and in other cases they adhere to their former finding.

480. What is the practice of the confirming officer generally when they adhere to their former sentence if they inflict an inadequate punishment upon a soldier and that is pointed out by the confirming officer, and the court refuse to alter their sentence?—He can only confirm the sentence.

481. But does he quash the proceedings altogether, and does the prisoner escape in consequence of the sentence not having been revised?—Not necessarily.

482. (*Lieut.-Gen. Peel.*) The final sentence must be the sentence of the court?—The final sentence must be the sentence of the court; but the confirming officer may remit, mitigate, or commute.

483. The revising officer has no power if the court insist upon their sentence?—None at all. He merely directs attention to certain points and they reconsider the case; and if they entertain the same opinion as before they adhere to their former decision.

484. And they may alter it upon reconsideration?—They may.

485. (*Mr. Whitbread.*) Have you ever known a case where a court has passed a sentence and the confirming officer has sent it back for revision and a severer sentence has been the result?—Yes.

486. (*Mr. Headlam.*) Supposing that the revising officer thinks the punishment not sufficient, he can remit it to the court below to consider whether the punishment should be increased; and not unfrequently the court below abides by its opinion, and does not increase the punishment?—Yes.

487. Supposing on the other hand, the revising officer thinks the punishment too severe, he can himself remit a portion of the sentence, can he not?—Certainly.

488. And that probably would be the course he would take if he thought the punishment was too severe?—Yes.

489. So that the confirming officer has the power at once of remitting if he thinks the sentence too severe, but in the event of his thinking it not severe enough he can only increase it by sending it back?—Certainly, it must be the sentence of the court.

490. (*Lieut.-Gen. Scarlett.*) Do you consider that a regimental court-martial is generally held for the purpose of investigating the guilt or the innocence of a prisoner, or for awarding punishment beyond what a commanding officer is empowered to give?—I consider that it is a combination of the two.

491. But do you consider that it is more for the purpose of awarding a punishment than for the purpose of investigating the guilt of a man which has been already in some degree decided upon?—To award a punishment.

492. Do you think that the number of regimental courts-martial might be diminished if a greater power was extended to the commanding officer, who is now restricted to seven days' confinement?—The number of courts-martial would be diminished, I think.

493. Do you think that the frequency of regimental courts-martial rather takes away from the effect that those courts-martial have upon the minds of the men?—No, I do not.

494. (*Mr. Mowbray.*) Do you think that the number of officers constituting a regimental court-martial might be less than five?—It is provided for; that if you cannot get five, three will suffice.

495. But would you not think it advisable to reduce it to three generally?—No, I do not see why you should so reduce it.

496. (*Mr. Russell Gurney.*) I see that by the regulations the court is to consist of officers of equal or superior rank to the prisoner tried. Supposing a junior officer is on his trial, and the prosecutor or the person who is preferring the charge is one of superior

Major-Gen. Rumley.

26 March 1868.

rank to himself, what is the proportion of his own rank that the prisoner would have?—There is nothing defined with respect to that by regulation, or Mutiny Act, except that none are to be of inferior rank to the prisoner.

497. Might it be constituted entirely of officers of the same rank as the prosecutor?—It is not usual so to do. I never remember a general court-martial so constituted.

498. Then as a matter of practice, supposing we were to take the case of a general and an ensign, the general being the person at whose instance the charge is preferred, and the ensign being the prisoner, would the ensign have on the court any officers of his own rank?—Surely.

499. How many out of the thirteen?—I do not think there is any number defined by the Mutiny Act.

500. But as a matter of practice?—As a matter of practice I should say out of thirteen he would have as many as four ensigns or lieutenants, and it would be made up of captains and field officers; there is nothing defined as to the number of officers of the same rank as the officer tried to be on the court-martial.

501. As a matter of practice how many ensigns would there be?—Of ensigns and lieutenants I should say there would be four.

502. And of those would two be ensigns and two lieutenants?—Yes.

503. Do you think that it is perfectly fair to the one of junior rank that he should have so small a proportion of his own rank?—I think so.

504. (*Mr. Whitbread.*) Have you ever known a case where a prisoner was acquitted by the court, and the confirming officer sent back the case for revision, which ended in his being convicted?—Yes.

505. (*Chairman.*) Is that a frequent case?—It is not frequent.

506. Do you know the result of any such case?—I do not remember.

507. (*Mr. Mowbray.*) The power of sending it back exists?—Yes, and it is occasionally exercised.

508. (*Lieut.-Gen. Peel.*) Does the revising officer when he sends back the sentence state the grounds upon which he sends it back?—Yes.

509. (*Lieut.-Gen. Eyre.*) There are now, I think, six denominations of courts-martial; might not those be reduced to three, or even to two, viz., a general court-martial and a minor one of the same denomination, and perhaps a regimental court-martial, so as to get rid of the detachment general court-martial?—I do not see how you could get rid of the detachment general, because, if I rightly understand the Articles of War, this detachment general is resorted to where you cannot conveniently assemble the number of officers required for a general court-martial; so that if you wished to exercise the powers of a general court-martial where that number of officers is not available you must take the minor number of officers.

510. (*Lieut.-Gen. Scarlett.*) Are there not, in point of fact, only three kinds of courts-martial; the regimental, the district, and the general, other courts-martial being exceptions, but having the same power relatively?—Yes.

511. (*Lieut.-Gen. Eyre.*) The garrison and the district courts-martial are precisely identical, are they not?—They are precisely identical in power and constitution.

512. With regard to the district court-martial, which is frequently composed of officers of the prisoner's own regiment, do you not think that that would be better altered?—I do not see anything to gain by any alteration; the prisoner has the power of objecting to any of the members, or to the president.

513. (*Lieut.-Gen. Scarlett.*) Do you not think that where it was possible from the fact of these being a number of officers of different regiments it would be better to have them from different regiments?—Surely. I think it is an exceptional case in a district to have them all of one regiment. It only occurs when they cannot get others.

514. (*Mr. Mowbray.*) If the court were composed of officers from other regiments it would be more likely to secure an impartial trial for the prisoner, would it not?—It would. It is only when others are not available that the court is so composed.

515. (*Lieut.-Gen. Eyre.*) What is your opinion as to regimental courts-martial as now constituted, are such courts absolutely necessary on home service, or could they be dispensed with except on active service or in isolated situations?—They could be dispensed with if you had a superior court, such as a district or garrison court-martial.

516. The general constitution of a regimental court-martial is a captain and four subalterns, all of whom may be very young, especially the subalterns; do you think that it would be more satisfactory and that it would settle all the scruples of those who object to those courts if they were composed of a field-officer, two captains, and two lieutenants; and might not such a court as this that I have last described be armed with greater power than the present regimental court and deal with heavier crimes?—They might, certainly; I think, for the reason given by Lieut.-Gen. Eyre, it would be advisable that the constitution of those courts should be so altered, if only such very young officers were available.

517. Do you not think that this would be a better system than to descend in the scale of rank according to the continental fashion?—I do.

518. You think that it would be better to go up than down?—I do.

519. With respect to the new practice of courts-martial, you that the system of a Deputy Judge Advocate is good?—I think so.

520. And you have no improvement to suggest as to that?—None.

521. Do you think, from your experience, that the rank held by such officer is of any consequence to the efficient performance of his duty?—No, provided he has the experience.

522. His rank does not signify, provided he has the proper experience?—No.

523. Do you consider that, as a rule, courts-martial are less just, less considerate, and less merciful, considering the grave importance of discipline, than civil courts are?—I have not had much experience of civil courts, and therefore cannot say.

524. You have not acted as a magistrate?—No, nor have I attended sessions much, so that I am not competent to answer the question.

525. There are some, and not a few, who think that a regimental court-martial might act merely as a jury, to pronounce only as to the guilt or innocence of the prisoner, and that the punishment should be awarded by some high military authority specially appointed to perform such judicial duty, rather in imitation of civil practice, what should you think of that?—I think you had better leave it as it is. The confirming officer has the power and to suggest his reason for a revision; he has that sort of controlling power which this superior officer would possess.

526. With reference to my question about the change in the constitution of regimental courts-martial, if that suggestion was carried out might it not tend to render them a great deal more efficient, and to reduce the necessity very frequently experienced for resorting to district courts?—It might, and probably would have that effect if you gave them increased powers.

527. I am not sure whether you have expressed a decided opinion as to the real necessity of writing the whole of the proceedings of courts-martial?—I do not say that there is a downright necessity for it, except for the case that was mentioned by one of the Commissioners, namely, that the Judge Advocate-General, to whom these courts-martial are referred, if there is nothing in the documents to show where the illegal question arose, has not that control which he otherwise would have by the questions being written.

528. (*Mr. Mowbray.*) Does not that consideration

render it absolutely necessary that there should be a written record of the proceedings of every court-martial?—There is a written record of the proceedings of every court-martial.

529. Do you consider that the proceedings would be complete without a written record of the evidence?—No, there is a written record of the evidence.

530. (*Chairman.*) I see by the 734th section of the Queen's Regulations that, with a view of making junior officers of regiments more acquainted with the principles of courts-martial they are ordered to attend every court-martial at the station where they are quartered for six months after they have joined their regiment?—Yes. The words of paragraph 734 of the Queen's Regulations are, "With this object in "view, officers will be required on their entrance into "the army to attend the proceedings of all courts-"martial that may be held at the station where they "are quartered for at least six months from the date "of their joining. They are not, however, to be "permitted to remain in court when it is cleared for "deliberation, and are not to be nominated members "of courts-martial until the commanding officer shall "deem them competent to perform so important a "duty."

531. Is that practice universally kept up in the regiments?—Yes.

532. Looking to the general practice, do you think that there are a sufficient number of courts-martial at the various stations to give the junior officers this requisite information with regard to the courts?—I think that Article should be taken in connexion with Article No. 265, which is as follows:—"The com-"manding officer is to take frequent opportunities of "personally examining the officers, more particularly "the subalterns, upon every point connected with "their duties in the field; as to their knowledge of "the 'Mutiny Act and Articles of War,' the 'Queen's "Regulations,' the 'Field Exercises,' and the 'Mus-"ketry Regulations;' of the forms, principles, and "practice of courts-martial." I think this, in connexion with the section which I read before, should prepare a young officer to take his place as a member of a court-martial.

533. From your experience, you would say that those two of the Queen's Regulations are strictly attended to throughout the British army?—I can only speak as to depôt battalions, because it was only over them that I had control as Inspector-General of Infantry.

534. Was it the case at Gibraltar when you had that command?—I took care that this was carried out in the regiments under my orders.

535. But you could not speak to the practice in other commands?—I could not.

536. Do you think it a very essential part of the duty of a commanding officer that he should attend to those regulations?—Undoubtedly.

537. Do you think that the average number of courts-martial at the various stations in six months is sufficient to give the junior officers on that station the amount of experience which is required in those two sections?—I think it is.

538. (*Mr. Headlam.*) Is it not the case that in the great majority of courts-martial the facts are very simple and very few?—Very much so.

539. And is it not also the case that in the great majority of instances there is really no defence at all?—Generally.

540. The man either pleads guilty or throws himself on the mercy of the court and says that he has nothing to say?—Yes.

541. But is it not also the fact that every now and then a case occurs of very considerable difficulty and gravity, involving the character of an officer, for instance, and in which difficult points of evidence are continually raised during the trial?—I noticed it during a court-martial of which I was a member.

542. Is it not the case with respect to these latter courts-martial that they very often fail?—Not in my experience; in the case to which I allude there were legal advisers on both sides.

Major-Gen. Rumley.

26 March 1868.

543. Is it not the case that not unfrequently where the sentence is submitted to the Judge Advocate-General he recommends that it should not be carried out?—I presume that he does so; but these courts-martial go to higher authority.

544. With respect to all the simpler cases, as I understand you, you think think that the present system has no disadvantages, and you are not prepared to make any recommendation?—No.

545. With respect to those more difficult cases, do you think that it would be any improvement if they were more assimilated to trials of a civil kind; if a gentleman of high legal ability was to decide upon all the difficult questions of evidence which arose upon them; and if the prosecution were conducted by a counsel of eminence; and if the defence were conducted by a counsel also on the part of the prisoner; and if the president, or whatever you might call him under those circumstances, then summed up to the officers forming the court-martial, and they gave their verdict after hearing all those points which have been raised upon the trial?—My practice and the result of my experience do not induce me to think that it would be an improvement.

546. Supposing it to be true as I have stated that many of those cases fail in consequence of mistakes made by the court, have you any suggestion to make as to an improvement?—No; the president has the assistance of the Deputy Judge Advocate as to any legal points.

547. That is his duty at the present moment?—Yes.

548. If at the present moment that system does not result in making the courts successful, have you any suggestion to offer for making them better hereafter?—No; assuming that in such cases the court has had the advice of a Deputy Judge Advocate.

549. You do not think that if there was a legal officer presiding at the trial, and filling the place of Deputy Judge Advocate, and himself deciding upon all points of evidence and of law, the trial would be more likely to be successful?—I have had no experience of such a practice, and therefore cannot answer the question.

550. You cannot give any suggestion for any material improvement with respect to those more grave and complicated cases?—I cannot.

551. (*Mr. Mowbray.*) Have you had much experience in trials in cases of embezzlement and cases involving matters of account?—I have been on courts-martial where officers have been tried for such offences.

552. Have you also known cases where non-commissioned officers have been tried for similar offences?—Yes.

553. Do you think that in matters of account those questions have been satisfactorily disposed of?—I think so, and that substantial justice has been done.

554. Do you think that the court have gone patiently and intelligently into the case?—I do.

555. And do you think that those cases have been proved by legal proof, such as would have been accepted in an ordinary criminal court?—I only know what is accepted at courts-martial, and not what is accepted at ordinary criminal courts.

556. You think that such cases have been patiently investigated and fully proved?—I do.

557. (*Lieut.-Gen. Peel.*) Do you consider that the present constitution of regimental courts-martial enables the members properly to exercise the powers with which they are entrusted?—I do

558. (*Mr. Russell Gurney.*) Do you think that in practice any inconvenience arises from the authority given to the Deputy Judge Advocate who may be of very inferior rank to the president of the court-martial?—No.

559. You do not think that the dual authority works ill in any way?—No.

Major-Gen. Rumley.

26 March 1868.

560. But the questions put by the president may be over-ruled by the Deputy Judge Advocate, may they not?—They may.

561. You think that no jealousy is created thereby?—Oh, no.

562. Has your attention been directed to whether it would be desirable in the trial of a non-commissioned or a private to have any persons more nearly of the prisoner's own rank constituting a part of the court?—I do not think that that would be of any advantage.

563. Do you think that it would tend to give satisfaction to the prisoner?—It might do so, and I believe it is the practice of some foreign powers to do that.

564. You think it would give more satisfaction to the prisoner?—It might give more satisfaction to the prisoner, but I think *quoad* the substantial justice it would not have any effect at all.

565. But there is provision with respect to the trial of officers, or at any rate there is a practice that there should be always some of his own rank on the court?—Yes, none of inferior rank.

566. Is not the object of that to give him confidence in the tribunal?—I presume so.

567. In the same way, supposing there were persons of the same rank as the non-commissioned officer on the court-martial, would it not tend to give him more confidence in the tribunal?—I doubt it.

568. (*Lieut.-Gen. Eyre.*) The Prussian army, we will say, is composed of a very large proportion of gentlemen, and consequently you have some of the privates and non-commissioned officers to form part of the court; but then you may say the prisoner is being tried by his peers, he is himself a gentleman, although a private in the army, and those privates sitting on the court are of the same class; but we must bear in mind, must we not, how wholly differently those armies are constituted from our own?—I do not think the cases are comparable.

569. (*Lieut.-Gen. Scarlett.*) Have you ever heard of a company court-martial?—I have heard of them; but I have never seen them put in practice.

570. Do you believe that the men would have more confidence in their own class than they would if they were tried by their officers?—I do not.

571. Do you believe that they would have less confidence?—I do.

572. Do you believe the punishments would be more severe or less severe?—I believe they would be more severe.

573. (*Chairman.*) Will you now give your opinion to the Commission with regard to the punishments inflicted by sentences of courts-martial, beginning with corporal punishments. I believe the sentences for the infliction of corporal punishment are much more rare in the British army than they were a few years ago?—Yes, they are.

574. Do you happen to know in how many instances corporal punishment has been administered in the British army during the last year?—I do not.

575. You have not seen the return of those punishments which has been made?—I have not.

576. But supposing that during the past year not 20 sentences of corporal punishment have been carried out, it follows as a matter of course that some other punishment must have been substituted to a great extent for the corporal punishment of former times; do you know what is the nature of the punishments now inflicted instead of corporal punishment?—It must be imprisonment with or without hard labour.

577. Has a prisoner to undergo that imprisonment invariably at the place where he is sentenced, and under military authority?—Generally so.

578. Is there any power of having the imprisonment inflicted by the civil authority in our civil gaols?—Yes.

579. Are not prisoners sent to civil gaols?—Yes.

580. What authority have the courts-martial to send a soldier to a civil gaol?—They have none at all.

581. How do they proceed then when they wish to send a soldier who has been convicted to a civil gaol?—The confirming officer directs where they shall go.

582. What power has he to do that?—He directs where they shall be imprisoned according to the accommodation.

583. Has the confirming officer the power of ordering any prisoner under sentence of court-martial to be confined in any gaol in England that he selects?—If he has no military place to receive them.

584. If there is no military place has he himself the power of ordering it without the control of the magistrates of that part of the country?—It is an understood arrangement, provided for by the Mutiny Act.

585. But in your opinion the commanding officer has the absolute power of ordering a soldier to be confined in one of our civil gaols?—Yes, the confirming officer.

586. Could you state to the Commission what has been the effect in the British army of the great diminution of the punishment of flogging in the army; has it been for the advantage of the army or the reverse?—I should say for the advantage of the army.

587. As regards the discipline of the army do you think it has been affected in any material degree by the diminution of corporal punishment?—I do not.

588. Would you recommend any further limitation of that punishment?—I would not.

589. To what crimes is that punishment now limited?—It is limited to mutiny and insubordination accompanied with personal violence. The 22nd section of the Mutiny Act is as follows:—"Any "court-martial may sentence any soldier to corporal "punishment for mutiny or for insubordination ac- "companied with personal violence; and save as "aforesaid, and as herein-after mentioned, no court- "martial shall have power to sentence any soldier to "corporal punishment."

590. (*Mr. Whitbread.*) That is for ordinary service is it not?—That is for ordinary service.

591. (*Mr. Russell Gurney.*) What is done in the field?—It goes on: "Provided that any court-martial "may sentence any soldier to corporal punishment "while on active service in the field, or on board any "ship not in commission, for mutiny, insubordination, "desertion, drunkenness on duty or on the line of "march, disgraceful conduct, or any breach of the "Articles of War, and no sentence of corporal "punishment shall exceed 50 lashes."

592. (*Chairman.*) Then I understand that at the present moment you cannot inflict corporal punishment at home even for disgraceful conduct?—No, only in cases of mutiny and of insubordination accompanied with violence.

593. Is it your opinion that it is absolutely necessary for the discipline of the service, that that power should be maintained?—I am of that opinion.

594. Do you believe that in the course of the last year, or since the alteration of the system, there have been many soldiers tried for mutiny and insubordination who have not been subject to corporal punishment?—I am not in a position to answer that question, because for the last three years I have not been employed.

595. Can a district court-martial inflict corporal punishment?—Not unless the soldier is tried for mutiny or insubordination, with violence.

596. Can a regimental court-martial try for mutiny and insubordination?—They can on the line of march.

597. And then they have the power of inflicting corporal punishment, have they not?—Yes, when it is approved by the officer commanding.

598. Can you speak as to the repetition of the offences by the same prisoner since the alteration?—No.

599. You could not say whether the frequency of offences by the same prisoner has been greater?—I could not.

600. With regard to the other punishments which may be inflicted by courts-martial, have you any suggestions to make to the Commission for an alteration of them?—No, I have not.

601. With regard to the power of cashiering an officer, for instance, you have no suggestions to make?—No.

602. Can you speak to the expenses of our military tribunals?—I cannot.

603. At Aldershot, for instance, you have had no experience of that kind?—No; I have not been stationed at Aldershot.

604. (*Lieut.-Gen. Peel.*) Have non-commissioned officers the power of inflicting any punishment?—None.

605. They have the power of reporting to the adjutant, have they not?—Yes; it is their duty to do so.

606. Then the adjutant has the power of punishment?—Only to a certain extent.

607. What power has the adjutant?—He has none exceeding that delegated to officers commanding troops or companies.

608. Then the captain of a company can inflict a punishment?—Yes; up to a certain extent.

609. What power has the captain of a company in that respect?—He can give three days' drill and confinement to barracks.

610. Then the commanding officer has further power, has he?—Yes.

611. What power has the commanding officer?—168 hours' imprisonment, hard labour, or solitary; stoppage of pay for absence not exceeding five days; and confinement to barracks not exceeding 28 days.

612. If he thinks that there is any crime deserving a greater punishment than that then there is the regimental court-martial?—Yes.

613. What are the powers of the regimental court-martial?—42 days' imprisonment with hard labour, or solitary confinement not exceeding 14 days at a time; and stoppage of pay to make good any loss, damage, or destruction.

614. What is the next step?—The next step is the district court-martial.

615. What are its powers?—They are corporal punishment, imprisonment, with or without hard labour, and with or without solitary confinement.

616. Have they the power of inflicting corporal punishment?—Yes, if the man is tried for mutiny or insubordination with violence.

617. Have they the power of passing a sentence of death?—No; that can only be the sentence of a general court-martial.

618. (*Lieut.-Gen. Scarlett.*) Can a district court-martial inflict discharge with ignominy, and marking with the letters "B C"?—It can.

619. (*Lieut.-Gen. Peel.*) Will you state the power of a general court-martial?—Death, penal servitude, imprisonment, forfeiture of pay or pension, corporal punishment, and stoppage of pay.

620. In the case of officers, have they the power of cashiering?—Yes.

621. (*Mr. Mowbray.*) And in all cases a general court-martial can order a soldier to be discharged with ignominy without reference to the nature of the offence?—Yes.

622. (*Chairman.*) Among the punishments which a court-martial can award, there is a punishment by a pecuniary fine, is there not, upon the officer?—I see by the 17th section of the Mutiny Act, that "Any officer or soldier of Her Majesty's army, or any "person employed in the War Department, or in "any way concerned in the care or distribution of "any money, provisions, forage, arms, clothing, ammunition, or other stores belonging to Her Majesty's "army or for Her Majesty's use, who shall embezzle, "fraudulently misapply, wilfully damage, steal, or "receive the same knowing them to have been stolen, "or shall be concerned therein or connive thereat, "may be tried for the same by a general court-martial and sentenced to be kept in penal servitude "for any term not less than five years, or to suffer "such punishment of fine, imprisonment, dismissal "from Her Majesty's service, reduction to the ranks "if a warrant or non-commissioned officer, as such "court shall think fit according to the nature and "degree of the offence; and every such offender shall, "in addition to any other punishment, make good at "his own expense the loss and damage sustained; "and in every such case the court is required to "ascertain by evidence the amount of such loss or "damage, and to declare by their sentence that such "amount shall be made good by such offender; and "the loss and damage so ascertained as aforesaid shall "be a debt to Her Majesty, and may be recovered in "any of Her Majesty's courts at Westminster or in "Dublin, or the Court of Exchequer in Scotland, or "in any court in Her Majesty's colonies, or in India, "where the person sentenced by such court-martial "shall be resident after the said judgment shall be "confirmed and made known; or the offender, if he "shall remain in the service, may be put under stoppages not exceeding one-half of his pay and allowances until the amount so ascertained shall be "recovered," so that the fine is acknowledged.

Major-Gen. Rumley.

26 March 1868.

623. Do you take the words "such amounts shall be "made good" to refer to the word "fine" in the former part of the paragraph, or do you believe that a court has the power of inflicting a fine according to its discretion?—No; because it says that the "offender shall, "in addition to any other punishment, make good."

624. One of the punishments is the stoppage of pay on the part of a private soldier, is it not?—Yes.

625. Do you believe that the stoppage of pay might be carried farther than it is now, and made a more general punishment in the British army with advantage?—It depends upon who has the power of inflicting it, and how it is to be carried out.

626. Do you believe that the punishment of stoppage of pay or fine might be applied as a punishment with greater effect than it is now?—I do not.

627. You do not think that the punishment of private soldiers by the stoppage of pay might be substituted for the different punishments to which they are now subjected with the same effect as results from those punishments now?—I should not be for stopping any more pay.

628. You think it would be would be a cause of discontent amongst the soldiers if the punishment of stoppage of pay was carried farther than it is now?—I think so.

629. (*Lieut.-Gen. Eyre.*) Would it not virtually fall upon the captain sometimes?—It would.

630. (*Lieut.-Gen. Scarlett.*) Do you think that the punishments of imprisonment for periods such as two years are too long, at present?—I think they are too long.

631. Both in regard to the prisoner himself and in regard to his comrades?—Yes, you are imposing his duty upon his comrades during the period that he is so imprisoned.

632. Do you think that the prisoner derives any benefit as to his future conduct from being imprisoned, say for two years?—I do not.

633. (*Lieut.-Gen. Eyre.*) Might it not with great advantage be reduced considerably?—I think so.

634. (*Mr. Russell Gurney.*) Is as much as two years often awarded?—Yes.

635. (*Chairman.*) But if you were to reduce the punishment of a prisoner from two years would it have the same effect in deterring crime in the army?—I think so.

636. You think that one year, for instance, would have the same effect in deterring crime as two years?—Yes.

637. (*Lieut.-Gen. Eyre.*) In that case would you propose that the prison discipline should be more stringent and severe?—I think it should be carried out in its strict integrity.

638. Is there a power anywhere of remitting the sentence of two years' imprisonment?—Yes, the revising officer has that power.

639. Is that often exercised at the present time?—Yes; I should think so.

640. Do you think it is a general practice now to remit a portion of the punishment?—I think so.

Major-Gen. Rumley.

26 March 1868.

641. You would recommend, then, that the imprisonment should be for a shorter period, but that it should not be on any account remitted?—I think it should not be remitted altogether, but shortened.

642. (*Mr. Russell Gurney.*) By the 763rd Regulation it is forbidden to reprimand a non-commissioned officer by sentence of court-martial, are there not offences committed by non-commissioned officers which might be fairly met by a reprimand, and can you give any reason for that limitation?—The commanding officer has the power to reprimand a non-commissioned officer without bringing him to trial.

643. But if upon inquiry by court-martial they thought that was a sufficient sentence, is there any reason why they should not award it?—I think it would be a pity to send a non-commissioned officer to trial, if such was deemed a sufficient sentence.

644. But you assume that the commanding officer would form the same judgment upon his partial inquiry as the court-martial would upon full inquiry?—The commanding officer generally has a full inquiry.

645. But may not circumstances be elicited in an enquiry before a court-martial which would present the offence in a different light?—It might be so.

646. Can you give any reason, then, why the court-martial should not have the power of passing a sentence of reprimand upon a non-commissioned officer?—It appears to me to be taking up the time of the court unnecessarily if he should merely be reprimanded, since the commanding officer has that power.

647. Are there offences for which a commissioned officer is adequately punished by a reprimand?—So it would appear from the regulations and the Articles of War.

648. It is a regulation by which the members of a court-martial would feel themselves bound, would they not?—I suppose they would.

649. (*Mr. Mowbray.*) With respect to reductions to the ranks, do you think it necessary that a non-commissioned officer should in all cases be reduced to the rank of a private before you punish him?—Yes, I do.

650. Do you think it not desirable that there should be some reduction short of reduction to the rank of a private?—That is competent for the commanding officer, by not promoting a non-commissioned officer according to seniority.

651. But is it not equally competent for a court-martial?—I do not quite understand the question. Do you mean to say *quoad* reduction, or *quoad* ulterior punishment.

652. A commissioned officer, say a captain, is tried for an offence which the court consider is adequately met by a sentence that he be reduced, and that he be placed at the bottom of his own rank?—That is no reduction of rank; that is only placing him at the bottom of a list.

653. Do you not think it desirable that there should be a similar practice as to the reduction of non-commissioned officers in their own rank?—No; because I do not consider that it is a reduction. It is only placing him down so many steps. The captain does not cease to be a captain, he is still a captain only put down so many steps; and the commanding officer can exercise the same power towards a non-commissioned officer indirectly, by not taking him for promotion when it comes to his turn.

654. Then you argue that the court-martial should not do it because the commanding officer has the power of doing it without court-martial?—Yes.

655. But if the court-martial thinks the case is adequately met by such a sentence, can you see any reason why such a sentence should not be inflicted if it met the exigencies of the case?—I should not consider it an adequate punishment for a court-martial to award.

656. Is that the only reason you can give why a court-martial should not award it?—Yes.

657. (*Chairman.*) Has it not always been considered a great difficulty in the army, that there is no punishment for a non-commissioned officer except reducing him to the ranks?—Yes, but I do not think it would be desirable to punish a non-commissioned officer until he was reduced to the ranks.

658. Will you state the reasons why that rule should apply to a commissioned officer but not to a non-commissioned officer?—Because the officer commanding can reprimand a non-commissioned officer without the intervention of a court-martial; and no such punisment for a non-commissioned officer is alluded to in the Mutiny Act or Articles of War.

659. But would not that rule apply to a commissioned officer as well?—Yes; but a reprimand to an officer by a general court-martial is recognized by 125th Article of War.

660. But in your experience have you not found in any regiment, for instance, that you have commanded that it was very difficult to deal with a non-commissioned officer from the impossibility of punishing him without reducing him?—No doubt.

661. Could you suggest any way in which that difficulty could be met?—I could not.

662. (*Lieut.-Gen. Scarlett.*) Would there be any great objection to reducing a serjeant to the rank of corporal for any neglect of duty?—I do not see any objection to it.

663. (*Mr. Russell Gurney.*) You cannot do it now, I believe?—You cannot.

664. (*Lieut.-Gen. Scarlett.*) Putting him at the bottom of his rank would be futile, would it not, inasmuch as the man is not taken according to seniority, but according to merit for promotion?—Yes.

665. Therefore putting him at the bottom of his rank would be no punishment at all?—No.

666. (*Chairman.*) Do you not think that it might be an advantage if a commanding officer had the power to stop the pay of a non-commissioned officer for neglect of duty?—I should not advocate that power being vested in the commanding officer; I would rather leave it to a court-martial.

667. Might it not be advantageous that it should be a punishment to a non-commissioned officer that he should have his pay stopped for certain crimes which now oblige a commanding officer to reduce him to the ranks?—It might be advantageous, but I offer it merely as a speculative opinion.

668. You would not say that you would recommend it?—No.

669. (*Lieut.-Gen. Peel.*) A commanding officer has now the power of reducing a non-commissioned officer to the ranks, but he may make him a corporal again the next day, if he pleases, may he not?—A non-commissioned officer is reduced to the ranks by the sentence of a court-martial, but the commanding officer may promote him the next day.

670. (*Mr. Mowbray.*) According to that process he would first suffer the indignity of being reduced to the ranks?—Yes.

671. (*Lieut.-Gen. Peel.*) Have you not known many instances in which serjeants have been reduced and have afterwards become first-rate serjeants?—Yes, after a time.

672. (*Chairman.*) But still it does affect the position of a non-commissioned officer very much in the regiment to have been reduced, does it not?—No doubt.

673. Do you think if some punishment could be found without lowering him in the eyes of his comrades it would be an advantage?—I think so.

674. Can you suggest any other punishment but the reduction of pay which might be applied in the case of non-commissioned officers?—At this moment I cannot.

675. Is position in the regiment amongst non-commissioned officers highly valued as regards their rank amongst themselves?—Yes.

676. Is the senior serjeant looked upon with higher respect than the junior serjeant?—No.

677. Then it would not be a punishment to him to reduce him to the bottom of his rank, as you can with officers?—No.

678. (*Lieut.-Gen. Scarlett.*) Do you consider that a non-commissioned officer under any punishment would meet with the same respect from the men, and have the same authority over them?—No.

679. Do you not think that punishing him at all short of reducing him to the ranks would take away his authority?—I do.

680. And that he would not be so eligible to carry out his duties as he ought to be?—He would not.

681. (*Mr. Russell Gurney.*) There are no longer two classes in the army among the privates, are there?—No.

682. Do you think that the system of having two classes was a good one, under which all men, in the first instance, should come into the first class, and should not, until they had committed some offence, be reduced to the second?—I think it was introduced with reference to corporal punishment, but corporal punishment being now confined to insubordination or mutiny, it is unnecessary.

683. But is it desirable to have two ranks under existing circumstances?—I do not think it is.

684. (*Lieut.-Gen. Scarlett.*) In fact, are there not now three classes, namely, men at 1*d.* a day, men at 2*d.* a day, and men at 3*d.* a day, and so forth, and good-conduct pay; and does not that divide them into classes?—Such a classification exists for good-conduct pay.

685. (*Marquis of Hartington.*) But not as to punishment?—Not at all.

686. The man with 3*d.* a day and good conduct pay would be as liable to punishment as others, would he not?—Surely.

687. (*Mr. Russell Gurney.*) Do you think it would increase the facility of obtaining recruits of respectable character in the army if they knew that, in the first instance, they formed portion of a class which could not be subject to corporal punishment?—That is the case at present, except for two offences.

688. Would it, in your judgment, increase the facility of obtaining recruits of a respectable class?—I do not think it would.

689. (*Lieut.-Gen. Eyre.*) How would a scale of good conduct pay answer, in imitation of that for the privates, and made specially applicable to serjeants?—Of course, they would be liable to the deprivation.

690. They would; and moreover they would have the inducement to arrive at that good conduct pay?—In my opinion there is no additional inducement needed for that rank.

691. (*Mr. Headlam.*) I think I understood you to say that the diminution of corporal punishment had acted well for the discipline of the army, to the extent of which it had been carried?—Yes.

692. But you do not think it would act well if it were carried further?—No.

693. Have you any reason to give to the Commission for that opinion?—I do not think that for such crimes as mutiny and insubordination accompanied with violence you could give a sufficiently adequate punishment to deter men from the commission of those very grave offences.

694. Do you speak from any reference to cases that have occurred or merely from your own ideas upon the subject?—From my own ideas upon the subject.

695. You do not think that the results which have hitherto flowed from the diminution of corporal punishment apply to those larger crimes?—No.

696. (*Mr. Whitbread.*) Would it be any advantage in your opinion to retain in the service a man who is guilty of such a crime as mutiny or insubordination?—No advantage at all.

697. Would it not be an advantage instead of sentencing a man of that kind to corporal punishment to get rid of him altogether?—Yes, if you could prevent his re-enlisting.

698. (*Lieut.-Gen. Eyre.*) You might have him branded, might you not?—Even that he would get over.

699. (*Mr. Whitbread.*) Have you any other reason except that of his re-enlisting?—No, I think he would be a good riddance.

Major-Gen. Rumley.

26 March 1868.

700. (*Lieut.-Gen. Scarlett.*) But would it not in some degree encourage a man to commit those crimes?—It would have that effect. A man who wanted to get out of the service would commit these crimes.

701. (*Mr. Whitbread.*) But is not that assuming that a large proportion of the army are continually serving against their will?—I do not think that a large proportion of the British army are serving against their will.

702. Then there is no objection in your mind beyond the danger of their re-enlisting?—None.

703. Except that it would induce men to commit those crimes for the sake of getting away?—I think so.

704. That is founded upon the assumption that there are a portion of the men serving against their will, and who are really anxious to get out of the service, and who would commit such a crime to get their discharge, even though that discharge was accompanied with a term of imprisonment?—I think there are such men.

705. To any extent?—I could not say.

706. (*Lieut.-Gen. Peel.*) Those are men of bad character, are they not?—Yes.

707. (*Mr. Russell Gurney.*) And whom, therefore, it is very desirable to get rid of?—Yes.

708. (*Mr. Whitbread.*) But do you think it is likely that a man who is so anxious to get out of the service will come in again?—Yes, I do.

709. With what object?—Because they do not know what to turn their hands to. They think they can better themselves; they fail, and cannot get employed, and the alternative is to endeavour to re-enlist.

710. With regard to the imprisonment you would propose to confine the sentence to one year?—Yes.

711. Then there would be no intermediate sentence between that and five years' penal servitude?—No.

712. You do not see any disadvantage in that?—No.

713. With regard to the sentence of solitary confinement, which is sometimes given, are you aware that that cannot be carried out in the civil prisons; that there is no such punishment as solitary confinement known in the civil gaols?—I was not aware of that.

714. If this punishment cannot be carried out in civil gaols would it not be inconvenient that the court should pass it?—The confirming officer is generally aware of the circumstance, and directs the court accordingly.

715. Is imprisonment one of the punishments for ordinary drunkenness?—The commanding officer can give the man 168 hours' imprisonment.

716. (*Chairman.*) Can you try by court-martial a case of drunkenness alone?—No; unless in a case where a man is tried for habitual drunkenness, and the last instance only is proved; then they can award for that instance of drunkenness.

717. (*Mr. Mowbray.*) Then the charge is habitual drunkenness?—Yes.

718. (*Mr. Whitbread.*) Is it within your knowledge that the shot drill has been much objected to on medical grounds in the military prisons?—I was not aware that it had been so objected to.

719. (*Lieut.-Gen. Eyre.*) It is a very common thing to hear and to read of raising the *morale* of the army and making it attractive to the better classes; is that possible unless every facility is given for ridding it of the bad characters; and is not a habitual drunkard unfit to be maintained as a soldier, and should he not be discharged and marked to prevent his returning; is he not dangerous to the army and useless to his comrades while he is in prison?—I do not think you could carry out any arrangement by which you would entirely get rid of drunkards.

Major-Gen. Rumley.

26 March 1868.

720. (*Lieut.-Gen. Scarlett.*) Do not many habitual drunkards make very good soldiers when they cannot get liquor ?—Very good.

721. (*Lieut.-Gen. Eyre.*) With regard to the book called the Mutiny Act and the Articles of War, might it not be with great advantage simplified and made more clear by some easy process, such as putting the Acts and the Articles side by side, or by giving references, and also explaining paragraphs that are rather in antagonism ?—Yes, I think it could be done. Here is the 47th Article of War, for instance, which I am told there is great difficulty in reading and interpreting rightly : "Our Commander-in-Chief may, "and any officer holding a commission from us as "Commander-in-Chief of any of our forces out of "the United Kingdom may, within his command, "dispense with the trial of any soldier confessing "desertion if he shall so think fit, and may thereupon "order such soldier to serve in any regiment or "corps, and such soldier shall thereupon forfeit his "service for the period between the date of the "desertion stated in his confession and the date of "the said order to serve, and shall not be allowed to "reckon the said period as a part of the limited "service for which he was enlisted or re-engaged, or "for which his term of service may have been "prolonged, and shall also forfeit all advantage as "to additional pay, good-conduct pay, and pension "on discharge which might have otherwise accrued "from the length of his former service, and shall also "forfeit all medals and decorations whatsoever which "he may be in possession of and authorized to wear, "together with any annuity or gratuity thereto ap-"pertaining ; but any such soldier, if he shall have "subsequently performed good, faithful, or gallant "services in our army, may, on the same being "duly certified by our Commander-in-Chief, be "eligible to be restored to the benefit of the whole "or of any part of his former service, and should "the restoration be approved by us, our order for "the same will be signified through our Secretary "of State for War." Now, the difficulty which appears in reading this Article is to know what part of this service is to be restored on subsequent good conduct, whether it is the service before he confessed his desertion, or the part between his confession of desertion and his being directed to serve.

722. Should not such things be made clear for young officers ?—Certainly ; I mention it because I have heard many opinions from officers as to its vagueness.

723. (*Lieut.-Gen. Peel.*) Would the young officers have anything to do with it ?—No, except in recommending a man to the commanding officer.

724. (*Lieut.-Gen. Eyre.*) Are there not a vast number of inconsistencies which want clearing up ; for example, do you think that the 81st and 168th Articles of War are in accordance, one of which says that a man may be sentenced to deprivation and the other of which says that he shall be so sentenced to deprivation ?—Perhaps the Commission will allow me to bring to their attention the 78th Article of War, which applies to habitual drunkenness. It is at page 273. "Any soldier who shall, within 365 days, have "been drunk four times or twice drunk when on or "for duty or on parade or on the line of march, may "be charged with habitual drunkenness and be de-"prived of one penny a day of his pay for any period "not exceeding 168 days, if convicted thereon before "a regimental or detachment court-martial, and for "any period not less than 168 days, and not ex-"ceeding 672 days, if convicted before a general, "district, or garrison court-martial ; and in addition "to any such punishment the court may (if it shall "think fit), sentence such offender to any other "punishment which the court may be competent to "award." Now does that "addition" mean that you shall have exhausted the full extent of the stoppage of the pay before you add the other punishment ; or award a portion of the stoppage of the pay, and then add a punishment ?

725. (*Mr. Headlam.*) Would you make it compulsory upon the court to exhaust the stoppage of pay ?—I would.

726. Would you not think it desirable that, in some cases, they should not exhaust the stoppage of pay ?—In that case he should not get the additional punishment.

727. Do you not think it should be left to the discretion of the court ?—I think it is a pity to do so.

728. (*Lieut.-Gen. Eyre.*) When deserters confess themselves to be deserters for the first time, they are marked, do you not think that prevents a good many returning to the service from being afraid of the branding ? Supposing it to be a case of first desertion, and the man surrenders of his own accord, do you think it would be desirable to dispense with the branding in such a case ?—No, I do not think it would ; it is not obligatory to brand for desertion, but the president must write a letter to state the reason why it is not done.

729. It is obligatory to sentence them to it, is it not ?—No ; a letter accompanies the proceedings if it is not done.

730. (*Mr. Russell Gurney.*) Is any bodily pain inflicted by the act of branding ?—None, I believe.

731. (*Marquis of Hartington.*) Is there any uniform system now as to the appointment of a prosecutor in a court-martial ?—The general officer who convenes the court-martial generally selects an officer to prosecute.

732. And whom, as a general rule, does he select ?—The most competent man.

733. Is it generally the adjutant in a general court-martial ?—No.

734. As a general rule, do you think that the prosecutor has any means of making himself well acquainted beforehand with the facts of the case ?—Certainly.

735. In your opinion is any change necessary in the appointment and selection of the prosecutor ?—No.

736. (*Mr. Whitbread.*) How is it possible that a man, after once being marked, should obliterate that mark and get in again ?—I cannot tell you the mode, but they do it ; it is converted or changed into a harp, or an anchor, or something of that kind.

737. Would it not be very easy to decline to enlist a man who had any sort of mark of that kind about him ?—You might thereby lose the services of a good man who was not a deserter.

738. (*Lieut.-Gen. Eyre.*) Do you think that a well-considered scale of minor punishments would be an advantage ?—Undoubtedly. I am all for a scale of minor punishments, and that it should be quite an exceptional case when it was departed from. I think that it would be of great advantage to the service.

739. Could you suggest any such scale of punishments ?—I think the best way would be to give to experienced commanding officers the several minor offences, and to ask them to define the punishments : then to collate their opinions, and to make out a good scale, and have it universally adopted.

740. You think that the present system is not an adequate one ?—I do not ; I think that a scale would be a far preferable system.

741. (*Chairman.*) There is such a scale in the Guards, is there not ?—I believe so, but I don't think they are identical in the three regiments.

742. (*Lieut.-Gen. Peel.*) You consider that minor punishments should be regulated by a general scale and should not be left to the discretion of the different commanding officers ?—I do.

743. (*Lieut.-Gen. Eyre.*) Would not such a scale greatly aid new field officers and other field officers left in temporary command, and detached officers ?—I think it would be of incalculable benefit to the service every way.

744. (*Marquis of Hartington.*) At question 97 Mr. Lushington was asked, "What is the province of "the prosecutor ; does he appear in the light of the "Attorney-General in a case for the Queen ?" and

the answer was, "It is difficult to give a direct "answer to that question, because, as you have heard "there is no provision made for the appointment of "a prosecutor, and his duty seems to be differently "regarded in different districts. I think that Colonel "Laye will tell you that it seldom happens that "a prosecutor is properly posted up in a case; "but he does to a certain extent conduct the pro- "secution." And then further on he says: "If a "case miscarries by reason of insufficient evidence "for the prosecution, I have often seen it made a "matter of observation by the commanding officer "that the court were remiss in their duty in not "calling certain evidence. One would say, accord- "ing to ordinary notions, that was the duty of the "prosecutor, and that it would be advantageous, as "he may know all the circumstances beforehand, "and as the court cannot know all the circum- "stances, that it should be his duty to take care "that all the necessary witnesses are present." From your previous answers I conclude that you do not agree with that?—I do not.

Major-Gen. Rumley.

26 March 1868.

745. In your experience you have not seen inconvenience from there being no regular system as to the appointment of a prosecutor, and you do not recollect cases in which he was not properly posted up?—No.

746. (*Mr. Mowbray.*) Have you often seen instances where the prosecutor has been a witness?—I am under the impression that he is precluded from being a witness.

747. (*Marquis of Hartington.*) And you would not suggest any change in the present practice?—No.

The witness withdrew.

LIEUT.-COLONEL THE HON. WILLIAM HENRY ADELBERT FEILDING examined.

Lt.-Col. the Hon. W. H. A. Feilding.

748. (*Chairman.*) Will you state to the Commission what offices you have held in the British army besides your regular regimental rank?—I was Aide-de-camp at Aldershot to the Lieutenant-General commanding in 1860. I was a student at the Staff College in that year, and I have held the position which I now hold, of Assistant Adjutant-General of the Northern Division of Ireland, since July 1864.

749. In what branch of the service have you served?—In the Coldstream Guards and the line.

750. For how long?—In the line from February 1852 to December 1854, and in the Coldstream Guards since that date up to the present time.

751. Then you hold your rank in the Coldstream Guards at the present time?—I am captain in the Coldstream Guards.

752. In your office of Assistant Adjutant-General has your attention been called to the subject of courts-martial?—Considerably.

753. You have had considerable experience in them, have you not?—I have, considering the short time that I have been in the service.

754. Have you any suggestion to make to the Commission, first of all, as regards the composition of those courts?—I have as regards the reduction in the number of members composing the different courts and the manner of their constitution.

755. Will you state in detail your objections to the present system?—First, as regards the constitution of the regimental courts-martial, I have found in Ireland, where the detachments that we are obliged to make are numerous, and very small in their number of officers, that it has been very difficult, and has occasioned great expense and delay in bringing men to trial, to be obliged to assemble the number authorized by the regulations; and often we have got inferior courts together, composed of men of very short experience and short service; and I should feel inclined to make one or two alterations. For instance, at head-quarters I should rather have it composed of four officers, one being a captain of not less than a given service, say eight years, who should act as judge and direct the court on points of law and evidence, and not take any part except in the summing up as regards the finding, and who should then proceed to direct the court as regards the sentence. But in the case of detachments, the court might consist of one captain and two subalterns, provided the captain had not less than eight years' service, and the subalterns each not less than four years' actual service.

756. What would be your object in that proposal?—To avoid very many unnecessary delays and insufficient weight of the court. Sometimes in a court, for instance in a cavalry regiment which has lately come home from India, and where they have had a great run of promotion, I have seen captains sitting of three years' service and subalterns of hardly any of them more than two years, and many of them hardly a year, who were utterly incompetent, in my opinion, to carry weight as a tribunal with the soldiers.

757. Would it be always easy to get a court constituted as you have suggested?—It would not. Many regiments have not above two captains of eight years' service; but still I would rather use them, and take them off other duties, and so give greater weight to the opinion of the court.

758. But supposing that a regiment was quartered in a district with only two officers of the requisite number of years' service which you suggest, would not the whole of the duty fall upon those two officers of the regiment?—Not necessarily I think.

759. How would you provide for it otherwise?—Because, in many instances, we have to bring prisoners into head-quarters to be tried; there are no cells for them to undergo their punishment in at their detachments.

760. But as regards the composition of the court, would it not be almost impracticable in certain stations to form any large number of courts with the limitations you have suggested?—I do not think so; but it is a regimental arrangement that the senior captain should take a great deal of the court-martial duty, and be let off the other duties, which the other captains should take. It might be inconvenient in the cavalry, where the captains have to attend so much stables; but that might be arranged by the commanding officer. I am only looking towards getting a weighty opinion from the court.

761. (*Lieut.-Gen. Scarlett.*) Have you seen any injustice done arising from the youth of the members?—I have very often seen incorrect decisions come to.

762. (*Mr. Whitbread.*) Have they been corrected on revision, or have they stood?—It is impossible to give a general answer to that, because it depends so much upon the commanding officers, and some courts are obstinate.

763. (*Chairman.*) Mr. Whitbread's question was to this effect: whether in practice those improper decisions on the part of the courts have been corrected by the revising officers?—Theoretically they are corrected, and it is to be hoped that it is done; but it is impossible to give a general answer.

764. (*Lieut.-Gen. Eyre.*) Are you speaking of regimental courts?—Of regimental courts.

765. (*Chairman.*) Have you any suggestions to make with regard to district courts-martial?—Yes; I would suggest that a field officer or a captain of not less than ten years' service should be president put upon the same roster, and four subalterns of not less than four years' service; and that on a general court-martial a field officer of not less rank than a colonel should be president; and that there should be not less than two field officers, two captains of not less than six years' service each, and two subalterns of not less than four years' service each.

766. Do you recommend that with the same object as before, viz., of giving greater weight to the decisions of the court?—Yes; and to avoid delays in the assembling of the court.

Lt.-Col. the Hon. W. H. A. Feilding.

26 March 1868.

767. (*Mr. Russell Gurney.*) In each of those cases is the presiding officer to take no part except in the summing up and direction?—No part except in the summing up and direction.

768. He is not to vote?—He is not to vote.

769. He is to be the judge, and they the jury?—Just so.

670. (*Chairman.*) Why do you exclude the president from giving a vote?—I think he is likely to be biassed in making his directions to the court if he has the casting vote. It gives him a double power at present.

771. (*Mr. Mowbray.*) Would you constitute those courts of an uneven number?—I would constitute them of an uneven number.

772. Then if the president has no vote there would be always the danger of the court voting two and two, would there not?—Regimental courts-martial are to consist of four members.

773. But I thought I understood you that the district court-martial was to consist of an even number?—I am only suggesting that the president in a regimental court-martial should act as judge.

774. (*Chairman.*) Would not that plan of yours involve us in this difficulty, that for the sake of the casting vote of the president you lose the best opinion in the court.

775. When you get an officer of so much superior standing to those in the court I should think his opinions are generally taken, though I have seen instances of an obstinate subaltern directing the whole court; but at the same time do you not lose, by excluding the president of the court from voting, the best opinion in the long run that there is in the court as regards the finding?—You may do so; but I still hold to the idea.

776. Have you any other suggestions to make with regard to courts-martial?—As regards the alteration of their powers, I should give the regimental court-martial more power. I should divide the powers of courts so as to raise the importance of the general court-martial, which always used to be thought such a very solemn proceeding, so that it should only try such cases as were absolutely necessary to be tried by a general court-martial. The men used to look up to that court and consider it as the most solemn thing that could possibly happen to them to be taken before a general court-martial or even before a district court-martial.

777. Do you think that feeling has ceased to exist?—In a very great degree, I think.

778. Owing to what circumstances?—It is impossible to say; but I should feel inclined to give the regimental court-martial power to try prisoners for the crime of desertion (which, after all, is a regimental offence), and of making away with necessaries when not aggravated by any other crime.

779. (*Mr. Mowbray.*) Then you think that there are many offences that are now tried by general court-martial which had better be tried by district court-martial, and that many offences tried by district court-martial which had better be tried by regimental court-martial?—Yes, I would give regimental courts-martial power to give eighty-four days, with or without the proper proportion of solitary confinement, and of branding with the letter "D."

780. (*Lieut.-Gen. Eyre.*) You think that regimental courts-martial are not sufficiently formidable and solemn?—I think not; and I think that the method of employing very young officers to sit upon them conduces very often to levity. Then as regards the power of district courts-martial, they should have power to sentence to corporal punishment for cases of gross or repeated acts of insubordination, and power to sentence to five years penal servitude, and general courts-martial should have power to sentence as at present.

781. (*Chairman.*) With regard to the proceedings in the court, are you of opinion that the mode of giving evidence at the present time is one that should be continued, that is to say, of taking down the questions and answers in writing?—It is tedious; but I think it is due to the prisoner that the questions should be put in writing, because there are some people who are appointed prosecutors who have no knowledge of framing a question legally and properly, and very often they are apt to put questions which are so improperly framed as to prejudice the case of the prisoner very much, and such as the Deputy Judge Advocate would never allow to be put upon record; and therefore I think he should have the duty of seeing whether they are legal or not; or, perhaps, if the Judge Advocate-General knew the prosecutor with whom he was dealing, he might dispense with the questions being put in writing.

782. Might not that difficulty be met in another way, by allowing the prisoner to have a friend to take charge of his case for him?—But very often the prisoner's friend might not himself have sufficient knowledge. I think it would be better to leave it in the impartial hands of the Deputy Judge Advocate, who I have always found acted very impartially in those cases.

783. (*Mr. Russell Gurney.*) Is the question not read aloud until it has been submitted to the Deputy Judge Advocate?—No.

784. (*Lieut.-Gen. Scarlett.*) If that was done *vivâ voce* could it not be stopped by the Deputy Judge Advocate?—Unfortunately the harm is very often done, or at least it has been done in peculiar cases.

785. (*Chairman.*) Is not that an objection which applies also to our civil courts and to trials of every kind?—I have seen it very often used with very great effect by lawyers to prejudice the case of a prisoner by putting a question *vivâ voce* which they knew would not be allowed to be put, in order to influence the jury.

786. Do you think that the military tribunal is superior to the civil tribunal in that respect, that you cannot so take an advantage of a prisoner?—Most undoubtedly. I think that every chance should be given to the prisoner.

787. Therefore you differ from one of the former witnesses in saying that now that shorthand writers are admitted into general courts-martial the old system of writing the questions and answers might be dispensed with?—It certainly gives you great assistance to have the answer taken down by a shorthand writer.

788. Then it is only the questions that you would have written?—Only the questions.

789. But not the answers?—No.

790. You think that every question should be submitted to the Judge Advocate before it is put?—Yes.

791. But in your practice have you not found that the present system of writing down questions and answers tends very much to lengthen the proceedings of a court?—It does; but in the important cases which I have in my mind I think that it would have gone very hardly out to the world if certain questions which I myself would have put, not being well up in the law at the beginning, had not been refused; they certainly would have tended to prejudice the proceedings of the court-martial in the eyes of the public; and, although I was very often pulled up for it, I was afterwards very thankful that I had been pulled up for it.

792. Then you do not think it is advisable to place a court-martial under the same rules and regulations as our civil courts in that respect?—No, not in that respect, except with the permission of the Deputy Judge Advocate. The Deputy Judge Advocate might know his prosecutor, and might confide in him; but I would leave it entirely in his hands, or in the hands of the president, to decide whether a question should be put *vivâ voce* or not; and the responsibility would then rest with the Deputy Judge Advocate.

793. Is it not in your experience that the length of the proceedings of courts-martial has been found to be a very great hardship upon the prisoners tried before them?—I should not say so. I think that

they felt that they were getting a fairer and juster trial. The longest lasted a month, but that was owing to delays which were very often asked for by the prisoner.

794. Does it not very often happen that the delay is asked for by the prisoner in consequence of his feeling that he himself has not been adequate to the examination or cross-examination of the witness for the prosecution?—I should not say so. I should fancy that he had more time to reflect upon the questions and answers given when the questions were taken down in writing. My own practice was before I went into court in the morning, in fact, before I took the case into court, to write down every question which I intended to ask. Very often I tore them up, finding them to be unnecessary, so that no time was lost in that way, except very rarely when I had to re-write a question. Sometimes it was illegally written in the first instance, and I had to remodel the question.

795 (*Lieut.-Gen. Scarlett.*) You have had great experience, have you not, in Ireland lately as prosecutor in several trials?—Yes, I had four months in one year and two months in another year continuously.

796. (*Mr. Mowbray.*) You have acted as prosecutor in several very important trials lately in Ireland?—Yes.

797. And in some of those cases I believe you have yourself had legal assistance?—Yes, in three cases.

798. In those cases has the prisoner also had legal assistance?—Yes; in all the cases in which I have prosecuted I think he had legal assistance.

799. Has the Deputy Judge Advocate also had legal assistance?—Yes.

800. What is your experience of the effect of having that legal assistance; do you think that it has made the proceedings more regular?—Yes; I dispensed with legal assistance after the first two or three cases, except in one very important case, on condition that the Deputy Judge Advocate was assisted by a barrister as adviser to keep me from going wrong and from putting illegal questions.

801. You considered that you were yourself sufficiently competent to conduct a prosecution, provided that the Deputy Judge Advocate had legal assistance to keep the court straight?—I thought so, with this proviso, and I considered that the effect upon the service would be greater if the prosecution was conducted by an officer, and not upon what one may call legal technicalities, and that the effect of a conviction without legal advice on the prosecution would have a greater effect upon the men, than a prosecution conducted with the assistance of legal advice.

802. In all those cases where you have had assistance you have yourself opened the case, and you have examined the witnesses, have you not?—Exactly so.

803. But the legal adviser has assisted you in framing the questions?—Yes, and in replying to legal points with which I was not conversant which were raised by the legal adviser of the prisoner.

804. In all those cases you have had a shorthand writer, have you not?—There was one for the court.

805. Do you have think that that has very much facilitated the proceedings of the court?—I think so.

806. Do you think that it would be possible to introduce it at all general courts-martial?—Certainly.

807. How far could you carry it in district courts-martial?—I would let it be in the power of the general commanding the district to recommend that a shorthand writer should be employed, generally his staff would know whether or not the case was likely to be prolonged and whether it was a difficult and intricate one, and the general would be in a position to advise.

808. You have been asked as to the length of trials, is not one cause of the length of trials the short number of hours during the day during which the court sits?—We sat from 10 o'clock till 1, and from 1 o'clock till 4, for nearly four months.

809. Are you aware that in the Articles of War for the present year it is proposed to give the court power to sit after 4 o'clock?—I am not aware of it as yet, I have not had time to look into it.

810. Do you not think that it often causes inconvenience that the sittings of court are so short?—Very often indeed, and I should be very sorry to see it limited to one hour.

811. And it often happens perhaps that a witness is under examination or cross-examination and the examination is interrupted, and the witness may be tampered with before the next day?—Exactly so, and that was my reason for making that remark.

812. So that it is most important, is it not, that the court should be able to prolong its sitting, if it is merely for the purpose of concluding the examination of a witness?—Exactly.

813. (*Lieut.-Gen. Peel.*) The offences upon which you have been employed as prosecutor in Ireland have been of a peculiar character, have they not, and not ordinary military offences?—Yes.

814. And therefore they have required in more than ordinary cases the assistance from counsel have they not?—Yes.

815. With regard to regimental courts-martial, you propose that there should be always a captain of a certain number of years service; of course you mean general service, and not only as captain. To whom would you leave the selection of the officers to perform that duty; because it is not always a senior officer who is the most competent?—There should be a roster of all those officers above that length of service, and they should be taken in regular turns.

816. But do you consider that their standing is sufficient to ensure their being competent to perform the duties?—I think so; I think that one ought to prevent the soldiers as much as possible from supposing that the commanding officer can influence the president of the court, which they are rather apt to fancy may be the case if they see a very young officer sitting.

817. But they are always taken by roster now, are they not?—Yes, but a soldier is very apt to fancy that the commanding officer has undue influence over a very young officer.

818. Has the commanding officer generally more influence over the junior captains than over the senior captains?—Generally I think he has as regards those things.

819. (*Viscount Eversley.*) Would not that throw a very heavy duty upon officers of that standing?—It might be made up to them in other ways.

820. (*Lieut.-Gen. Eyre.*) What is your opinion of the manner of taking votes at courts-martial?—I think it very indifferent under the present system. I do not like its being done *vivâ voce* at all.

821. (*Chairman.*) In what way would you take them?—I would let each man write his vote upon a piece of paper and send it up folded to the president without any consultation, after having been directed by the president as a judge directs a jury; and let each man without any individual consultation, after collective consultation, write his vote down.

822. But the great advantage of a jury is supposed to be that it has the power of discussing the points together before it pronounces its sentence?—Yes; but let them do it collectively and then register their votes separately; let them talk over the matter and vote without saying what each man intended to vote.

823. (*Lieut.-Gen. Scarlett.*) What do you conceive to be the inconvenience of the present practice of beginning with a junior and taking the votes *vivâ voce*?—I have seen men lean towards the opinions of others, simply because they have not taken the pains to follow the proceedings. They have read a newspaper and have not been very attentive to the proceedings, and they have taken the opinion of the man next them or some other man.

824. Do you not think that by taking them as we do at present the younger ones are not influenced by the opinions of the older ones, and that the older ones correct the opinions of the younger ones as it goes

Lt.-Col. the Hon. W. H. A. Feilding.

26 March 1868.

upwards, the president being last, and that they are so more likely to come to a just conclusion?—But would it not do equally well if each man recorded his vote upon paper, and if no one knew what his neighbour's vote was, and they were passed up to the president?

825. (*Mr. Russell Gurney.*) Would you think it desirable that young officers should not have the advantage of discussing the question with those superior in judgment to themselves?—They would discuss it; I think that is a very great advantage.

826. (*Lieut.-Gen. Scarlett.*) That they have at present, have they not?—Yes.

827. (*Lieut.-Gen. Peel.*) I understand you to propose that, after having consulted together, instead of each being asked for his vote, each should write down on paper "guilty" or "not guilty," and hand up his vote?—Exactly so.

828. (*Mr. Headlam.*) I understand you to think that a shorthand writer is a matter of convenience?—In certain cases.

829. Is it not of consequence that there should be a full and complete record of the proceedings of the trial?—Yes, with certain exceptions.

830. What exceptions?—In the case of a man pleading guilty I should think, unless there was some very good reason to the contrary, that I should proceed at once to take evidence as to character and former service, and then sentence, without going into details.

831. Do you not think that they should go into the facts in the case of a man pleading guilty?—Not unless the president and prosecutor thought it necessary.

832. In a case of that kind do you think that there would be no necessity for examining the facts?—Yes; but not usually in cases of desertion and making away with necessaries, and in cases of habitual drunkenness.

833. Are there not cases where a man pleads guilty when an examination of the facts is necessary before awarding his punishment?—Yes; but then the prosecutor will say that this is a special case.

834. But in other cases is it not necessary to go into the facts?—I think that in other cases it may not be necessary to go into facts.

835. In other cases where a man does not plead guilty would you not think it necessary that there should be a complete record of the proceedings for the opinion of the revising officer, and for the opinion of the Judge Advocate-General afterwards?—Certainly.

836. And that would be done most conveniently by having a shorthand writer, would it not?—It would.

837. But in cases where it was not worth while to go to the expense of a shorthand writer, then it should be done by somebody else?—By anybody rather than by the president. I would never let the president take down the proceedings.

838. With respect to delicate and complicated cases, such as occur now and then, you are aware probably that many of those cases have failed. Such cases, for instance, as those where the conduct of an officer has been impugned; that many of those cases have lasted for a long time, that difficult questions of evidence have arisen upon them, that irrelevant issues have been raised, and that dissatisfaction has been given at the trials?—Yes.

839. With respect to cases of that kind have you any suggestion to make for the improvement of the proceedings?—I fancy that there is a very great improvement, which has not yet been able to show its fruits to any great extent perhaps, which was made last year by the Horse Guards' circular as to Judge Advocates and their position in the courts. I think the presidents, as I have often seen, were inclined rather to pit their opinions and those of the court against that of the Judge Advocate, but after all the Judge Advocate is supposed to be a competent person.

840. Do you think that it would be an improvement if in cases of that description the functions of the president and of the Judge Advocate were united in one person, and that person a civilian of position and station, say, for instance, a Queen's Counsel, appointed specially for the occasion?—I did think so once, but I do not think so now; I thought so before the last general proceedings, but I have changed my opinion.

841. Supposing that a trial of that kind was assimilated as nearly as possible to a great civil trial; that is to say, that a judge presided, and that there was a counsel for the prosecution and one for the defence, and that the officers summoned filled the position of a jury, and that the judge decided all questions of law and evidence and then charged the officers as a jury, and that they upon that gave their verdict of guilty or not guilty; if the trial was conducted by a gentleman of the position which I have mentioned, do you think that would be an improvement?—I think not; I should be very sorry to see it done.

842. Do you think that it would take it too much out of the army?—I think it would take it too much out of the army. I think that if the Judge Advocate was assisted by the best counsel that could be got it would be as much as was desirable.

843. Would you allow anybody to address the court, either on the side of the prosecution or on the side of the defence, except military men?—No, I would not. In the instances which I have seen where it has been done and where a speech has been written by a lawyer for a man on his defence, it has always been very unfavourably received by the court, and it has tended very much, I think, to disfavour the court in respect to the prisoner.

844. (*Chairman.*) Is it the case that no person may read the defence except the prisoner himself?—Any friend or any member of the court may read it at the request of the prisoner. I have seen it done repeatedly.

845. (*Mr. Russell Gurney.*) It must be a military friend?—It must be a military friend.

846. (*Mr. Headlam.*) So that according to the present practice nobody can address the court except a military man?—Nobody can address the court except a military man.

847. And you would adhere to that recommendation?—I would.

848. And that legal advice should not appear in the shape of direction of the court?—Certainly.

849. (*Mr. Whitbread.*) Is the prisoner allowed to have a friend and a legal adviser too?—As many friends as he likes.

850. (*Chairman.*) Had you much experience of the system before the present rule with regard to the Deputy Judge Advocate was adopted?—It was adopted just about the middle of the trials. I think I had heard very unseemly disputes previously to the issuing of that order between the Judge Advocate and the president of the court and the members, and I thought that it was high time that such an order came out to define the position of the Deputy Judge Advocate.

851. Have you had experience of it since?—No, I have not seen it; the first time that it was attempted the order was read and settled the question.

852. Could you put in a few words before the commission, the exact defect which has been remedied by that order?—The previously undefined actual position with respect to the court which the Deputy Judge Advocate generally held.

853. I believe that up to that period it was not quite certain whether he was not both prosecutor and legal adviser of the court at the same time?—Yes, and defender of the prisoner.

854. Will you state the limits of his office at the present moment since that order was issued?—They are contained in paragraph 771, section 14, of the "Queen's Regulations."

855. Do you think that order has increased the expense of the inquiry; has it rendered it absolutely necessary for every prisoner to call for some friend or some adviser?—On the contrary, I should think that the prisoner feels more secure in his present position than he did before.

856. In what exact respect?—I should think that he feels that there is a man appointed to watch over the proceedings, and to see that no illegal question is put either to the prejudice of his case or unduly to force the prosecution.

857. But the duty of the Deputy Judge Advocate now is to give a legal opinion to the court independently of the prisoner, is it not?—Exactly so.

858. Being obliged to give that opinion he must be precluded from taking advantage on behalf of the prisoner of any circumstances which may arise in his favour?—Not by regulation and by practice; I think that you will find that on the contrary the Deputy Judge Advocate would frequently come to the prosecutor and say, "Do you not think that it is "better not to press that question?"

859. (*Lieut.-Gen. Eyre.*) Does not his appearance in court give confidence to the prisoner?—I think so, certainly.

860. (*Chairman.*) You think that the alteration has been essentially for the benefit of the prisoner?—Certainly.

861. (*Mr. Russell Gurney.*) Has it had any effect in lowering the position of the president?—Some presidents think so, and other presidents are very glad of it. I have seen both instances.

862. Where, for instance, the Deputy Judge Advocate is of very inferior rank in the army to the president, is the effect good?—Now we have Deputy Judge Advocates who have a high rank.

863. You have in Ireland?—Yes, and in England too.

Lt.-Col. the Hon. W. H. A. Feilding.

26 March 1868.

864. But taking India for instance, what is the case there?—I am unable to give an answer about it for I have never been in India.

865. You cannot form an opinion of the effect of having not a trained Deputy Judge Advocate but an officer of very inferior rank over-ruling the president?—I was under the impression that those officers in India were specially educated and trained for the purpose.

866. (*Lieut.-Gen. Peel.*) By whom are the Deputy Judge Advocates selected?—I am unable to speak upon the question.

867. By whom were you appointed prosecutor in those cases?—By the Commander of the Forces in Ireland.

868. As Assistant Adjutant-General?—No, not *ex officio*.

869. Were you ever appointed out of your own head quarters?—No; they wanted to send me down, but I objected. I said that I thought it would be unadvisible.

870. (*Mr. Mowbray.*) Do you consider that the powers which are given to the Judge Advocate under the present regulations are such that the prisoner feels greater confidence in the impartiality of the court?—Undoubtedly.

871. And that its members are more sure to be guided by legal rules and are not likely to receive improper evidence?—Certainly.

872. In fact he feels the same confidence which a prisoner brought to the bar of a criminal court feels in the legal knowledge and impartiality of the presiding judge?—Exactly so.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

Room E., House of Lords.

Monday, 30th March 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
THE RIGHT HON. RUSSELL GURNEY.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
MAJOR-GENERAL SIR ALFRED HASTINGS HORSFORD, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
SAMUEL WHITBREAD, ESQ.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

LIEUT.-COLONEL THE HON. WILLIAM HENRY ADELBERT FEILDING recalled and further examined.

873. (*Lt.-Gen. Scarlett.*) In your practice have you had an opportunity of seeing the proceedings of a great number of district courts-martial?—I have.

874. Do you find that there is any uniformity of sentence for the same crimes, or that there is a great difference in the sentences?—I regret to say that there is a very great difference.

875. To what do you attribute that difference?—To a variety of causes: sometimes to indifference on the part of the court, or to their not having sufficient practice, or to their taking different views of the gravity of the same crime. I have seen as much difference as a month or six weeks or even two months' imprisonment for the crime of desertion in the same district.

876. (*Lt.-Gen. Peel.*) Is the question of character taken into consideration at all as regards the punishment?—Yes.

877. That would make a difference of course?—But, *cæteris paribus*, all the other things being the same, character and everything being the same, still in different parts of the district I have seen different sentences.

878. (*Mr. Headlam.*) Do you think that the court is influenced by anything which is known about the man other than what is in evidence before them?—I think that it would be difficult to prevent their being influenced.

879. In some cases it may be that the court knows that the man has a bad character independently, and that they give him a greater punishment?—I think they do.

880. (*Chairman.*) Does that difference of sentence occur more frequently in regimental courts-martial than in district courts-martial?—I do not think that I have ever noticed the subject so much in regimental courts-martial.

881. But in a district court-martial it is seldom that the whole court know much about the prisoner, is it not?—I think that, generally, two or three of them, if not more, would know all about the prisoner.

882. Do you mean the members of the court?—The members of the court.

883. Previously recorded punishments are invariably noticed in courts-martial, are they not?—They are put in as part of the evidence.

Lt.-Col. the Hon. W. H. A. Feilding.

30 March 1868.

884. But I understand you to say that, besides the recorded transgressions of the prisoner, his general character, as known in his regiment, is taken into consideration?—In some regiments it is taken from the adjutant; but in other regiments an excellent plan is pursued of its being given by the captain of the prisoner's company who appears.

885. That, I presume, is taken where the captain of his company is called to give evidence as to his character?—Just so; but in most cases it is the adjutant who gives evidence as to the man's character.

886. (*Lt.-Gen. Scarlett.*) But invariably some one is called as a witness to character?—Invariably.

887. (*Chairman.*) Is it invariably the case that some one is called to character for the prosecution?—It is after the finding. It is with a view of increasing or mitigating the sentence.

888. The court calls for it of itself?—Yes.

889. It is not brought merely as evidence for the defence?—No, unless it is specially called for by the prisoner.

890. (*Lt.-Gen. Peel.*) The prisoner has always an opportunity of calling evidence as to character, has he not?—Always.

891. (*Viscount Eversley.*) If there were any question about the law of the case before the court-martial, would not that be decided by the Deputy Judge Advocate?—It is he who directs the court in cases of law.

892. (*Lt.-Gen. Scarlett.*) That is in a general court-martial?—That is in a general court-martial.

893. But in a district court-martial there is no Deputy Judge Advocate, is there?—No, it is only in general courts-martial.

894. (*Chairman.*) With regard to military punishments in general, have you any suggestions to make, either with regard to the nature of them or the mode of carrying them out?—As regards habitual drunkenness, I should like to see the punishment for that altered a little.

895. What suggestions have you to make with regard to the trial and punishment of offenders in the case of habitual drunkenness?—I should like to see more power given to the commanding officer as regards the stoppage of pay for habitual drunkenness; that he should be able to stop a man's pay as if he had been tried by regimental court-martial, that is to say, 1*d.* a day for 168 days, the man, of course, always having the option of being tried by court-martial if he should elect to be so tried. At present the commanding officer has no power to stop the pay for habitual drunkenness at all. A regimental court-martial can stop (1*d.* a day) up to 168 days, but not beyond that time, for habitual drunkenness. The district court-martial can sentence to deprivation of a penny a day for 672 days. I would propose that the commanding officer should have the power to stop 1*d.* a day of the pay of an habitual drunkard for 168 days, and that the regimental court-martial should have power to sentence the prisoner to stoppages varying from a penny a day for 168 days for the first offence, and for the second offence from a penny to twopence a day for the same period, because, as they have increased the soldier's pay now, I think you might increase the stoppages. What you want to do is to take away from an habitual drunkard the means of obtaining liquor. Very often some of the best and cleanest soldiers are drunkards. I have seen many such cases. I recollect one case in my former regiment where a man had been twenty-seven times tried for drunkenness during his service, and yet he was the cleanest soldier in the regiment; I never saw a cleaner or a better soldier when he was sober.

896. (*Lt.-Gen. Peel.*) In no case would you give the commanding officer the power of inflicting a stoppage of 2*d.* a day?—No.

897. Would you go beyond that at all, because you are only taking away from him now the additional pay which was granted last year?—The district court-martial might sentence to stoppages in the same proportion.

898. Would you go beyond that to 3*d.* a day?—I would not go any further. You then come too hard upon the captains of companies, I think.

899. Supposing you put a man under stoppage who is in debt, that wipes off the stoppage, does it not?—I think it is credited to the Government, and I do not think the captain of his company touches the man's pay until he has cleared off his stoppage.

900. Then how would it be a hardship to the captain of his company?—He would be longer in being repaid any stoppage that there was for clothing or necessaries.

901. (*Mr. Russell Gurney.*) By the fact of the stoppage?—Yes; he has to pay the Government stoppage, which he is sentenced to by the court, before he pays any stoppage to his captain.

902. (*Lt.-Gen. Peel.*) That stoppage goes direct to the Government, does it not?—Yes; which I think it is a hardship.

903. (*Chairman.*) Do you think that this increase of stoppages, either on the part of the colonel or of a regimental court-martial, might be applied to some object which is for the general benefit of the soldiers of the regiment, and that they should be made acquainted with that fact?—I should be very loth to propose such a thing, because the men might think that the colonels were rather down upon them in order to get the money, and it is very essential that a soldier should never think that there is the smallest interest on the part of the colonel to touch his pay.

904. But this object to which I am alluding would be for the benefit of the soldiers themselves, for the public amusements in the regiment, or libraries, or some advantages for the soldiers themselves?—If you could have pattern commanding officers it would be a very good thing, but I am afraid it would hardly do to trust to the whole lot of commanding officers. It is a very wide margin to say "for the amusements of "the regiment."

905. I only instanced the amusement of the regiment as an illustration; but are there not several modes in which a subscription might be got up in a regiment for something that would be generally popular amongst the soldiers, and might not the stoppages of pay be applied to that fund?—It would be certainly very advisable to do it, but I think it is a very hazardous thing to touch.

906. Do you not think that it might have a great effect in stopping drunkenness?—In that case I should be inclined to vest that money in a committee, and let the colonel have no control except the power of veto, putting it entirely out of the power of the colonel to dispose of the money, and let it be disposed of by a committee of officers.

907. Would there be any objection to letting it be disposed of by a committee of private soldiers, or would that be contrary to the discipline of a regiment?—I think it would.

908. (*Lt.-Gen. Peel.*) I understand you always to couple your objection to this appropriation of the stoppages with your plan, that the commanding officer should have the power of causing the stoppage in the first instance?—Yes; I do not like the same man who has the power of causing the stoppage to have the direction of it afterwards.

909. But if the stoppage were by court-martial then the objection, which you raise as to the colonel being down upon them, would not arise at all, would it?—It would not.

910. (*Lt.-Gen. Scarlett.*) You would not object to let the court-martial have the power if it were done by court-martial?—I would not object then at all.

911. Do you think it would have any restraining effect on drunkenness, the men knowing that the fine would go to the benefit of their comrades?—No; I am afraid it might possibly act as an incentive.

912. (*Mr. Russell Gurney.*) But it might be a motive, might it not, for the other soldiers to assist in bringing such a man to justice?—There is no difficulty in bringing them to justice.

913. Their feeling would go with the punishment rather more, would it not, if it went to the general benefit of the regiment, rather than to Government?—Yes, it might do so; but I am afraid the *cons* would rather outweigh the *pros*.

914. (*Chairman.*) Is there any other punishment that you would suggest for drunkenness, or habitual drunkenness?—For slight cases of drunkenness, that is when a man comes into barracks at night so slightly drunk that it is quite a question whether he is in liquor or not, in some regiments they confine a man for the very smallest taint of liquor which there is upon him. They put him in the guard-room the whole night with other people very much more drunk than himself; probably the men are sick over him, and spoil his tunic and clothing. The doctors say that it has a very injurious effect upon them very often when they are a little in liquor to put them in the guard-room for a night, and I should be inclined to let such men go to their barrack-room, and be dealt with in the morning. Very often the soldiers will not stand a man's coming in a little drunk, and they correct those things themselves very much. With respect to absentees also, if a man, who was absent an hour or two at tattoo, was sent to his barrack-room to pass the night in his bed as usual, the men in his room would soon let him know, I think, if he was in the habit of doing this, that they would not be disturbed in the night by men constantly coming in late.

915. But would their objection apply in so slight a case of drunkenness as you have described?—They would soon let the objection take a tangible form, I think; there are no people who punish so severely as private soldiers among themselves.

916. Is that a crime which the private soldiers of the British army think very seriously about?—The crime to them would be disturbing their comrades at night after they had gone to bed. The doctors have decidedly recommended, on two or three occasions in Ireland, that in such cases the men should not be sent to the guard-room.

917. (*Lt.-Gen. Scarlett.*) Would it not be difficult to draw the line when the man was to go to the guard-room, and when he was to go the barrack-room?—I think that might be left to the discretion of the serjeant commanding the guard, he deals impartially with men of all regiments.

918. Are you aware that it is done differently in different regiments?—Yes. At present the serjeant is afraid of letting anybody pass into barracks upon whom he finds the smallest taint of liquor for fear he himself should get into trouble.

919. (*Chairman.*) Do you believe that the crime of drunkenness is on the increase or on the decrease in the army at the present time?—You must treat that question locally.

920. Should you, from your general knowledge of the army, say that the crime of drunkenness is on the increase?—I think we can scarcely give a fair answer to that question yet, because the men have hardly yet got over the advantage of having this extra pay. It certainly was very much increased at first, because men had a large amount of pay due to them, and coming into their hands all at once, they spent it, and there was a great deal of drunkenness. Many commanding officers gave the whole of the pay to the men at once, and they were in a state of drunkenness for, perhaps, a fortnight, and then they turned sober again. But it is hardly fair, I think, to give an opinion now.

921. (*Lt.-Gen. Peel.*) In fact they received back pay, did they not, from the 1st of April?—They did.

922. (*Chairman.*) Are you enabled to give the Commission any information with regard to the crime of drunkenness, and the punishment of it in any foreign army?—Not with certainty of late years, but it is very rare in other armies.

923. You do not know anything of the Russian army, do you?—Not since the Crimean war.

924. (*Lt.-Gen. Eyre.*) The pay too is much smaller in foreign armies, is it not?—Yes.

925. (*Chairman.*) You do not know what is the punishment, for instance, in the Russian army for drunkenness?—I do not.

Lt.-Col. the Hon. W. H. A. Feilding.

30 March 1868.

926. Do you know what the punishment is in any of the other European armies?—Not at the present time. I have been out of the way of studying foreign armies since 1862, but I believe that a great change has taken place everywhere since that time.

927. Upon that particular point have you any other suggestion to make?—Not as regards drunkenness.

928. The next crime which I will take is insubordination; have you any suggestions to make with regard to punishment for insubordination?—I regret exceedingly to see that they have taken away the flogging; I think it was really a necessity.

929. Do you believe that any other punishment can be substituted of equal efficacy for cases of violent insubordination?—Certainly not. I do not think that there is anything which can take the place of flogging.

930. With regard to insubordination, do you know what is the practice in any foreign army; in the French army, for instance?—Striking an officer is death.

931. Is that punishment carried into execution?—It is carried into execution.

932. Can you speak to that from your own knowledge?—I have never seen it carried into execution, but a man came and told me one day that he had been at a death parade of two soldiers, and I believed him.

933. (*Mr. Russell Gurney.*) Was that in actual service, or in time of peace?—It was in Paris that he told me. It was carried out at Vincennes.

934. (*Chairman.*) Will you state any other reason which you have for regretting the abolition of punishment of flogging?—I think that there were some men for whom no other punishment had any terror. I have seen men who had gone through a long course of punishments, and, in fact, had passed most of their time either in prison or in hospital, and who had at last been brought to their bearings by floggings, and had after that turned round and been excellent soldiers. I have a case in my mind at this present moment of a man who was eight years in the service, and the whole service which he was allowed to reckon was two years and 25 days. I think he had been twice flogged, and the commanding officer sent and spoke to him without any non-commissioned officer being in the room, as is usual, and pointed out to him his service, and told him that he should have to get him dismissed from the service with ignominy. The man has turned round, and is now about to be made a corporal, after having been a long time clear of the defaulters' book.

935. Do you think that there are many instances of that kind in the army?—I have known several, but that has occurred quite lately. I do not think that it is the flogging that disgraces so much as the crime.

936. (*Mr. Russell Gurney.*) Then in that case the threat of dismissal seems to have produced the effect upon him?—No, I think it was the judicious treatment of the commanding officer in speaking kindly to the man in an unusual manner.

937. (*Lt.-Gen. Peel.*) Independently of the effect which it has upon the man flogged, what effect do you think that witnessing corporal punishment has upon the rest of the regiment?—I think that they hate it. There is nothing that they hate so much as a punishment parade.

938. Do you think that it has the effect of deterring crime on the part of others?—I should think that it would have that effect upon individuals, but hardly upon the regiment.

939. (*Maj.-Gen. Horsford.*) Do you think that good soldiers consider it a necessary punishment?—I do.

940. (*Mr. Russell Gurney.*) Do you think that the continuance of it has any effect in preventing the obtaining of good recruits?—I do not think so, as it was arranged last year. It was only to be inflicted for

Lt.-Col. the Hon. W. H. A. Feilding.

30 March 1868.

mutiny or gross insubordination coupled with personal violence.

941. Do you think that was a good plan which was adopted at one time of confining it entirely to those who had been already removed from the first class?—In some instances it had a wonderful effect. I recollect recommending its being carried out in some cases where a whole regiment used to suffer from the misdeeds of some 20 men, who used constantly and repeatedly to be making away with their necessaries. No sooner had they come out of prison than they made away with the whole of their kit again, and were sentenced again to stoppages and imprisonment, and so it went on; at ast they were sentenced to corporal punishment, and we selected one of the worst of those cases for infliction, and it was inflicted, not only before the regiment, but before the two regiments then in those barracks. It stopped it like a shot, and had a most extraordinary effect.

942. But that under the present system could not be inflicted, could it?—No.

943. The question I put was rather with reference to a plan which was adopted at one time of dividing the army into two classes, and it was suggested not to allow the flogging of any man who was in the first class until he had been already degraded into the second; was that plan, in your opinion, a good one?—Yes; because it covered repeated acts. It was used as an extraordinary punishment at extraordinary times.

944. Do you think that it would be a popular thing with men in the army to know that, until they had misconducted themselves and had been reduced to the second class, they could not be submitted to the punishment of flogging?—I have seen that have very unfortunate results, in the case for instance of the Fenian trials, where perhaps some of those Fenian emissaries had entered into the army for the purpose of tampering with the soldiers. I was very sorry not to see corporal punishment inflicted upon them, which it could not be as they had conducted themselves thoroughly well before in all other respects. In some cases they only got two years imprisonment, and hardly ever could they inflict corporal punishment upon them. I should be almost inclined to add to the list of crimes punishable by flogging the crime of joining in seditious conspiracies or anything of that nature.

945. (*Lt.-Gen. Peel.*) In reference to a question which was asked by Mr. Russell Gurney, all serjeants and corporals would naturally be in the first class, would they not?—They would.

946. Would not a case of gross insubordination upon their part be a worse crime than on the part of a man who was in the second class?—Undoubtedly.

947. Therefore you think undoubtedly he ought to be subject to corporal punishment?—Certainly; but that would be a very extreme case.

948. (*Chairman.* Supposing that corporal punishwere abolished what punishment would you suggest to supply its place for insubordination?—I can really think of none. I think that there are some cases which it is impossible to deal with now, such as that of a man has been repeatedly tried for insubordination and gross insubordination.

949. (*Lt.-Gen. Eyre.*) Do you not think that the hands of the military authorities must now be greatly strengthened by some new means, and will it not be absolutely necessary to enable the Government to discharge really bad characters, marking them so as to prevent their return to the service?—Certainly; but I dare say that you are aware that it is very easy to obliterate those marks.

950. But might not that be so arranged as to prevent such a man's return to the service?—The present way of marking a man is quite inadequate as a safeguard to prevent a man's returning to the service; because a man by the repeated use of corrosive sublimate can remove all the mark.

951. Surely not so as not to leave some vestige?—I have seen it when it has been three parts gone, and you would not have known it.

952. (*Maj.-Gen. Horsford.*) But surely there has been something there?—There has been something there.

953. (*Chairman.*) But independently of the marking, do you believe that the fear of dismissal from the service and the marking would always be a check on insubordination, and might it not in some instances be an inducement?—I think in very many cases it would be an inducement. I have known people actually commit crimes in prison so as to get sentenced to penal servitude in order to get out of the service.

954. You think it absolutely necessary, if corporal punishment is done away with, that some other punishment than any which now exists must be found out if you wish to check the crime of insubordination in the army?—I think so.

955. Can you suggest any such punishment?—I cannot.

956. You would not, I presume, recommend that recourse should be had to the French practice of shooting?—There were cases in those great Fenian trials when I thought it was a great pity that that was not carried out; in three cases certainly.

957. But as a punishment for common acts of insubordination you cannot suggest any other punishment which you consider would be equally efficacious?—I cannot suggest any other punishment which would be at all adequate.

958. What would you suggest as the best substitute in your opinion?—I should be inclined to take a great deal more of the fatigue duties off the good soldier, and place them upon the men condemned to imprisonment in the military prisons and in the cells; and that, instead of wearing their uniforms as they do at present in the cells, they should wear a convict's dress, and that the most insubordinate should work in chains.

959. What do you consider to be the severest punishment now, excepting always corporal punishment?—I should say solitary confinement.

960. That is worse than the shot drill you think?—Much worse.

961. You do not think that shot drill applied for a lengthened period would be considered equally severe?—No; and I do not like the solitary confinement.

962. Can you always inflict the punishment of solitary confinement?—No; in many cases the doctors will not recommend it.

963. Could you, as regards the quarters of the different regiments, always sentence a man to solitary confinement?—If they put in the words "separate or solitary."

964. Have you had any experience of soldiers being confined in our civil gaols who were sentenced to solitary confinement?—We have no civil gaols in Ireland to which we commit soldiers on military sentences of imprisonment, except those who have been sentenced to be discharged from the army, in which case we have nothing more to do with them.

965. But in England, have you had any such experience?—In England I have had no experience.

966. But you would find great difficulty in carrying out solitary confinement as a substitute for corporal punishment?—Yes; very often we have great difficulty in carrying it out even now in the military prisons. They were obliged in 1861 at the Horse Guards to modify the mode of carrying it out. Previously to that date the courts-martial used to sentence to specified periods of solitary confinement, specifying at what portion of the imprisonment they were to be carried out; and I think that in July 1861 the Horse Guards found that in many cases it was impracticable, and that the governors of gaols could not carry out the sentence in that way, and they were obliged to leave it to the discretion of the governors of the gaols, the court-martial merely mentioning the amount of solitary confinement to be inflicted, and the amount of hard labour confinement

which should intervene between the portions of solitary confinement.

967. (*Marquis of Hartington.*) Do I rightly understand you to say that you think that the crime of insubordination would not be adequately checked, even by the sentence of penal servitude?—It might with young offenders, but not with hardened offenders.

968. Is it because you think that the desire upon the part of some soldiers is so strong to leave the army that they prefer penal servitude, with the prospect of leaving the army at the end of it, to remaining in the army?—I have known many such cases.

969. Is it not the case that the punishment of penal servitude is found tolerably adequate to check the most hardened offenders in civil life from the commission of crime?—I should hardly think so. I have seen many cases where there have been previous convictions and sentences of penal servitude against a person in civil life, and yet it does not seem to have deterred him from committing exactly the same crime, or even worse.

970. (*Mr. Russell Gurney.*) Is it desirable to keep such a man in the army?—Certainly not.

971. (*Lt.-Gen. Eyre.*) Would not getting rid of such men eventually work a great cure, so that the service would be so improved that it would hold out inducements to the better classes to enter it, which would of course reduce the necessity for punishment, if not wholly yet in a great degree, and instead of having a large number of men seeking their discharge, and committing crimes to gain it, would not the discharge from the army be a punishment?—I am afraid that such a course would be such a drain upon the service that until you had the good men into the service you would have your ranks very thin.

972. (*Mr. Headlam.*) Do you think that it would be a good thing if there was any investigation into the character of a man before he was enlisted into the army?—It would be a good thing if it were practicable; but I apprehend that in the present inefficient state of the police of the country, it would be quite impossible for them to arrive at any real character of a man.

973. Would a man be enlisted if it were known that he was a ticket-of-leave man?—I think not.

974. Would he be refused on that ground?—It is merely a matter of opinion; but I think not.

975. Do you think that he ought to be refused?—It depends very much what he was convicted of, and what his subsequent character had been; but I apprehend that there would be a great distaste on the part of any colonel to enlist a ticket-of-leave man.

976. Practically I think that no investigation whatever into character is made?—No.

977. (*Marquis of Hartington.*) Do you think that the desire of leaving the army at whatever risk, even at the risk of incurring the punishment of penal servitude, would apply to a large proportion of the men in the army now?—No, not to a large proportion.

978. It would only apply to the worst characters, you think?—To about five or six in a regiment; but when you come to apply that to a number of regiments you see how much the service would suffer.

979. Still you do not think that the drain upon the army which you describe of, say, five or six men per regiment, would be compensated by the advantages which General Eyre has mentioned?—It would be so were it not that I am afraid that were such a thing once allowed you would have a great number of other men who, finding that they had made a mistake in entering the army as their profession, and that it was distasteful to them, would commit such crimes as to entail their being discharged.

980. (*Lt.-Gen. Eyre.*) Do you not think that the number of very bad characters is really very limited, although they are so very much heard of from the seriousness of their crimes, and that the class of men who you say often commit crime to get out of the service is very small indeed?—I think they are generally about one quarter per cent., or one man in every 400 in the whole army. I do not mean to say in individual regiments. In some regiments I have seen the numbers as high as 20 or 24.

981. Do you call one in 400 a large number?—No, I do not call that a large number.

982. Could not the service well afford to get rid of such men?—The service would greatly benefit, no doubt.

983. Is not all their duty, or nearly all of it, thrown upon their comrades now?—Yes.

984. What does the high proportion of bad men in some regiments indicate?—An unfortunate system of command.

985. (*Chairman.*) I presume that is not always attributable to the action of the commanding officer, but to the system of the regiment?—Not to the then commanding officer.

986. (*Mr. Russell Gurney.*) Do you mean that the number may vary as much as from two to 20 according to the system of command in the regiment?—Yes.

987. (*Lt.-Gen. Peel.*) If the punishment of flogging should be abolished for mutiny and insubordination there still remains to a general court-martial the power of inflicting the sentence of death, penal servitude for not less than five years, or such other punishment as might by general court-martial be awarded, does there not?—Yes.

988. Do you not suppose that if corporal punishment was abolished, it would be necessary in some serious cases to sentence a prisoner to death?—Undoubtedly it would have a very great effect, but I fear it never would be carried out.

989. But would not a general court-martial, be a very aggravated case of insubordination or mutiny, in necessitated, if they had not the power of sentencing to corporal punishment, to sentence the prisoner to death?—Yes.

990. Which is considered now the severest punishment, 50 lashes or five years' penal servitude?—By the sufferer I should say, that if it was his first time the 50 lashes would be considered the severer punishment, but I do not think there has ever been a case of its being inflicted in peace time without some small amount of imprisonment, at any rate.

991. Then the lowest punishment for insubordination and mutiny that a general court-martial would award would be penal servitude for five years; they could not give a less period?—No; they could give him imprisonment. I have a case in my mind at the present moment of a man going with his loaded musket with intent to shoot the serjeant, and the musket went off; luckily it did not hit the serjeant, and the man was tried upon a charge of insubordination coupled with personal violence, and they did not sentence him to be flogged.

992. (*Mr. Russell Gurney.*) To what did they sentence him?—Two years. There was no struggle, and there was no personal violence used; he did not strike the serjeant.

993. He could not be sentenced to flogging?—No.

994. (*Chairman.*) Have you any suggestions to make with regard to the crime or the punishment for desertion?—I should allow the offence to be tried by regimental court-martial, not taking it away from the district court-martial, but allowing the regimental court-martial to deal with desertion with increased powers.

995. What objection do you offer to the present system, under which that crime must be tried by district court-martial?—It is very often inconvenient when the forces are very much broken up to assemble a district court-martial. The crime of desertion is so easily proved and so well known to everybody, that I think the regimental tribunal is quite fit to try the question.

996. You do not think that there is anything in the crime of desertion which renders it of sufficient

Lt.-Col. the Hon. W. H. A. Feilding.

30 March 1868.

importance to be exclusively judged of by a district court-martial?—Exactly so.

997. Would you suggest any alteration in the amount of punishment?—I would raise the powers of the regimental court-martial generally to 84 days for certain crimes, among which I should put desertion.

998. With regard to the stoppage of pay, would you make any alteration?—No, I would not make any alteration in that respect.

999. I believe the pay is stopped now?—It is.

1000. And that part of the sentence cannot, under any circumstances, be remitted?—That is the question which was raised the other day by General Rumley, I think. I should consider that the Secretary of State for War can remit the whole or any part. I have known the whole remitted.

1001. Do you think any alteration should be made in that?—I think not.

1002. Do you think that the power should still be retained in the Secretary of State for War to remit any portion of the sentence?—I think so.

1003. And to reinstate a soldier who had deserted as if he had not deserted?—Yes.

1004. (*Lt.-Gen. Peel.*) Is there any difference now in the punishment for desertion in the case of a man who has deserted more than once?—It depends very much upon the court which tries him.

1005. But is there a distinction in the punishment awarded him whether he has deserted once or twice?—I think there would be.

1006. A regimental court-martial could only give the number of days' punishment which you now suggest that they should be able to give?—They should not be able to give more.

1007. But if a man had deserted three or four times, then you would have him tried by district court-martial?—Yes.

1008. (*Mr. Headlam.*) Is there anything at the present moment to prevent a man who has deserted from being tried by regimental court-martial?—Yes.

1009. Where is that prohibited?—Article of War 42, at page 261, is in these words:—"Any officer "who shall desert our service shall suffer death, or "such other punishment as by a general court-"martial shall be awarded. Any non-commissioned "officer or soldier who shall desert our service shall "suffer death or such other punishment as by a "general court-martial shall be awarded; and if "tried by a district or garrison court-martial, shall "suffer such punishment as such court may award." Article 43 specifies what may be tried by a regimental court-martial.

1010. (*Chairman.*) What is the present distinction between absence without leave and desertion?—Beyond 21 days absence, or an absence from quarters with a proved intention to desert.

1011. (*Mr. Russell Gurney.*) If it exceeds 21 days without any proof of intent, does it become desertion?—It is provided for in the 43rd Article of War:—"Any soldier absenting himself without leave "for a period exceeding 21 days shall be tried for "desertion by a general, district, or garrison court-"martial, unless permission is given to try such "soldier for absence without leave by a regimental "court-martial; but any soldier may be tried for "desertion without reference to the time during "which he may have been absent, and may there-"upon be found guilty either of desertion or of "absence without leave."

1012. (*Mr. Mowbray.*) Have you known any case where a soldier tried for absence without leave exceeding 21 days has been tried for a minor offence?—Yes.

1013. (*Chairman.*) But by that Article the commanding officer would have power to try any man who had been absent more than 21 days without leave by regimental court-martial?—They are obliged to apply to the general officer for permission to do so, and it is seldom refused.

1014. The regimental court-martial has now the power to try for absence without leave, has it not?—Yes, for 21 days.

1015. And the distinction whether that is absence without leave or desertion rests with the court?—Yes; in cases only where a man is put on his trial for the graver offence.

1016. (*Lt.-Gen. Scarlett.*) The punishment depends a good deal upon whether a man surrenders himself, or whether he is taken up; and if he surrenders himself he is generally dealt with more leniently, is he not?—Yes; but it is also important as part of the finding.

1017. (*Chairman.*) Have you any suggestion to make with regard to the proceedings of the court in cases of desertion?—I should wish to see evidence taken before the finding as to whether the prisoner surrendered himself or was apprehended, and also as to the dress in which he was at the time of apprehension or surrender.

1018. What is your reason for making that suggestion?—To enable the court to come to a better decision as to whether the man really intended to desert or not.

1019. That evidence being given at present after the finding?—After the finding. Prisoners very often are unable to conduct their own defence, and I think that every assistance should be given to the soldiers.

1020. (*Lt.-Gen. Eyre.*) You are aware that a very large proportion of the soldiers who are in prison are there for desertion; do you think that the punishment now existing for that offence and the nature of the imprisonment are effective in reducing the crime?—I should wish to add a particular punishment to it for desertion.

1021. What punishment would you add?—I should wish to take away a certain portion of the man's pay, which should go to the fund of which the Chairman has spoken for the benefit of the regiment; so that whereas other people are doing his duty a certain portion (say 1*d.* per diem) of his pay should be stopped equal to the time he is in prison for his desertion, and should go to this benefit fund.

1022. (*Chairman.*) When he is in prison what pay does he get?—He gets none; a man in prison forfeits his pay and service for the days he is in prison.

1023. (*Lt.-Gen. Eyre.*) With regard to the punishment of imprisonment for two years, which is very often awarded by courts-martial, do you think that it is too long, or in fact that such a long period is necessary, and that it has a better effect than a shorter term would have with stringent prison discipline?—I think that as long as Generals commanding districts and garrisons have the power of remitting portions of punishments two years would not be too long a sentence, for the effect of reading the sentence out to the men upon parade would be good, and yet you could at any time cut the imprisonment short if you thought that the man was likely to turn out a good soldier.

1024. (*Maj.-Gen. Horsford.*) Do you think that it would be practicable to make the man who had been imprisoned make up the duties which the good soldiers had done for him during the time of his imprisonment?—It would be very desirable, but I could hardly give an opinion as to the practicability of it, because I have never commanded a regiment.

1025. (*Lt.-Gen. Peel.*) With regard to an opinion which you gave that it would be better to ask the question before conviction, whether a man had been guilty of desertion, or of absence without leave, has it a great effect upon the character of a man whether he had been guilty of desertion or not?—I think that it would be a very good thing to take evidence as to previous convictions of absence without leave or desertions.

1026. (*Chairman.*) What is included in the crime of disgraceful conduct?—The crime of disgraceful conduct is described in the Articles of War 79, 80, and 81 in these terms:—"Any officer who shall behave in "a scandalous manner, unbecoming the character of

" an officer and a gentleman." "Any officer, or soldier, " or other person employed in the War Department " or in any way concerned in the care or distribution " of any money, provisions, forage, arms, ammunition, " clothing, or other stores belonging to our army, or " for our use, who shall embezzle, fraudulently mis- " apply, wilfully damage, steal, or receive the same, " knowing them to have been stolen, or shall be con- " cerned therein or connive thereat." " Any soldier " who shall malinger, feign or produce disease or " infirmity, or shall wilfully do any act, or wilfully " disobey any order, whether in hospital or other- " wise, thereby producing or aggravating disease " or infirmity, or delaying his cure, or who shall " wilfully maim or injure himself or any other " soldier, whether at the instance of such other sol- " dier or not, or cause himself to be maimed or " injured by any other person with intent thereby " to render himself or such other soldier unfit for ser- " vice, or who shall tamper with his eyes with intent " thereby to render himself unfit for service, or who " shall steal any money or goods the property of a " comrade, of a military officer, or of any military or " regimental mess or band, or who shall receive any " such money or goods knowing them to have been " stolen ; or who shall steal or embezzle Government " money or property, or shall receive the same know- " ing them to have been stolen or embezzled ; or " who shall committ any other other offence of a " felonious or fraudulent nature, or who shall be " guilty of any other disgraceful conduct of a cruel, " indecent, or unnatural kind."

1027. Have you any suggestions to make with regard, first of all, to the nature of the crime, as to whether anything else should be included in it?—I should be inclined to recommend that repeated acts of making away with necessaries should be included as a charge of disgraceful conduct. It is a distinct robbery from the man's captain and a robbery from his comrades of the benefit of his services.

1028. As regards the punishment of the crime, have you any alteration to recommend?—I should like to see every man convicted of disgraceful conduct employed more frequently on public works in the sight of his comrades in a convict dress.

1029. Would you apply that punishment to all the crimes which are included in disgraceful conduct which you have just now read?—I would.

1030. In every one of them?—Yes; so that if he has done anything in the nature of conduct disgraceful to the character of a soldier he should be seen as a convict.

1031. (*Mr. Russell Gurney.*) You would desire power to be had of inflicting such punishment in every case, but not that it should be necessary to inflict it?—Exactly so.

1032. (*Chairman.*) Do you think that the punishments now awarded are in themselves sufficiently severe to check the crime?—I do not think that there is much disgraceful conduct in the army. There are a few thieves in every regiment.

1033. (*Lt.-Gen. Scarlett.*) But are not all defaulters to be seen working in a prison dress if they come out of prison at all?—Not if they are under sentence of imprisonment which is carried out in the cells.

1034. But if they come out to labour in the public works?—Only out of the military prisons, not out of the cells; but it is very rare, except at Aldershot, that they come out in their prison dress.

1035. (*Marquis of Hartington.*) Would you explain a little more fully your suggestions about making men under punishment work before their comrades in convict dress; what power would you propose to give?—Power to include it as a portion of the sentence that all the men who were committed to prison after a conviction of disgraceful conduct or of gross insubordination should, when they went out to work, wear a special dress. It is written on their commitments what they are convicted of.

1036. But when they are sent to prison they are sent away from their regiment, are they not, generally?—No; in Dublin, for example, we have six regiments in garrison, and the men are generally committed to the military prison at Dublin.

Lt.-Col. the Hon. W. H. A. Feilding.

30 March 1868.

1037. But in most cases under the present system, having been sent to prison, their comrades see no more of them until they come out as a rule, do they?—No; except at Aldershot, where they are employed a good deal upon public works.

1038. You would extend the Aldershot system, in fact?—I am not sufficiently cognizant of the details of the Aldershot system in other respects, but as regards that particular point I certainly would do so.

1038. (*Mr. Mowbray.*) Have you considered the question of punishments to non-commissioned officers?—Yes.

1040. Have you any suggestions to make of a punishment less than that of reduction to the ranks?—I think that it would be very advisable that in the case of staff serjeants the court-martial should have the power to reduce them to the rank of a platoon serjeant, as there is many a man who is not fit for a staff serjeant who may be very fit as a platoon serjeant, acting under the direction of other serjeants, and also there is many a serjeant who would make a fair corporal, but who is not fit for a serjeant. Although the commanding officer can make a man a man a corporal immediately after his reduction to the ranks, still I think that it is likely to have a bad effect upon the good private soldier to see a man who had been so lately reduced to his own rank promoted again over his head. He may think that there is some favouritism in the matter. It would be better for a court to have the power to reduce a non-commissioned officer as many grades as may be, in the opinion of the court, commensurate with his offence.

1041. You think it an unnecessary degradation first to reduce him to the ranks and afterwards to bring him back to the position of a corporal?—Yes. Take the case of a drill serjeant or a quartermaster-serjeant, who is reduced to the ranks, the next day he may be cleaning the privies with other men, and I think that tends to disgust a man very much with the service. There is no intermediate punishment at present.

1042. (*Mr. Russell Gurney.*) Would he make so good a soldier after having been reduced to the ranks as he would if he had been reduced from a serjeant to a corporal?—I should prefer the plan of leaving the option with the court to reduce a serjeant to a corporal or to the ranks.

1043. (*Lt.-Gen. Peel.*) Would you extend that option to the commanding officer?—Not if you give it to a regimental court-martial. I would sooner have all those things done by regimental courts-martial, to prevent the possibility of a commanding officer doing a thing out of pique or out of obstinacy.

1044. (*Mr. Russell Gurney.*) Has a commanding officer at present the power of reducing to the ranks?—No.

1045. That can only be done by a court-martial, can it?—Only by a court-martial.

1046. (*Maj.-Gen. Horsford.*) The full colonel of the regiment has that power, has he not?—He has.

1047. (*Mr. Russell Gurney.*) Would you not allow the colonel to have the same power of reducing to a corporal instead of reducing to the ranks?—I would give him the power of reducing to a corporal.

1048. (*Lt.-Gen. Peel.*) The full colonel has now the power of reducing a man to the ranks, but he has not the power of reducing from a serjeant to a corporal, and you propose that there should be the power in a regimental court-martial to do that which they have not the power to do; would you extend that power to the full colonel of the regiment as well as to a court-martial?—I would. The power of appealing to the full colonel of a regiment is very seldom used.

Lt.-Col. the Hon. W. H. A. Feilding.

30 March 1868.

1049. (*Mr. Mowbray.*) Have you any suggestions to offer about the minor punishments of soldiers confined in the guard-rooms?—I have made suggestions upon that head already. As regards men confined for absence without leave, and for a slight taint of drunkenness, that they should be allowed to go to their rooms, having given their names, and that they should be punished the next morning. Guard-rooms are often very much overcrowded on certain occasions, when men are tempted to go out late at night.

1050. (*Marquis of Hartington.*) You said in your last examination with regard to the system of taking down the questions and answers, "It is tedious, "but I think it is due very often to the prisoner, be- "cause there are some people appointed prosecutors "who have no knowledge of framing a question, "legally and properly, and very often they are apt "to put questions which are so improperly framed as "to prejudice very much the case of the prisoner, "and such as the Deputy Judge Advocate would "never allow to be put upon record, and therefore I "think he should have the duty of seeing whether "they are legal or not, or perhaps if the Judge Ad- "vocate knew the prosecutor with whom he was "dealing he might dispense with that." Have you often known of cases where the prosecutor has been incompetent?—"Incompetent" is a strong word to use; what I mean is that they are sometimes not familiar with legal phraseology.

1051. But does not your answer imply a little more than ignorance of legal phraseology; does it not rather imply an ignorance of the principles of law?—I still hold to that answer thoroughly.

1052. Have you any suggestion to make as to any different system of appointing prosecutors?—I think that it might be well when the application for a district court-martial or for a general court-martial goes into the staff, that the commanding officer should add thereto a list of the officers whom he would recommend being appointed as prosecutor on the trial. At present it is generally taken for granted that the Adjutant is prosecutor.

1053. Would you recommend that there should be any office like that of a staff prosecutor, one prosecutor for a district, for instance?—It would be advisable, but I am afraid the country would not stand the expence for the very small amount of duty which he would have to perform.

1054. How many Deputy Judge Advocates are there?—Three; one for the north of England, one for the London district, and one for the whole of Ireland.

1055. Would it in your opinion be desirable that there should be an equal number of staff prosecutors?—It would be desirable, but I do not think that there would be sufficient work for them.

1056. But would there not be as much work for the prosecutors as there is for the Deputy Judge Advocates?—No; because the Deputy Judge Advocate has at present the collection of all the different courts-martial before they come to the Judge Advocate-General's office in London. He collects them and revises them all.

1057. Then you think that in ordinary cases an official like a staff prosecutor is not required?—No; I do not think that they would find work enough for him.

1058. (*Lt.-Gen. Scarlett.*) At a regimental court-martial is there any prosecutor at all?—No, not on ordinary occasions.

1059. (*Chairman.*) Would you recommend that there should be a prosecutor in every regimental court-martial?—I think it advisable that on every court-martial there should be a prosecutor.

1060. (*Marquis of Hartington.*) What is the present system of promulgation of the finding and of the sentence of courts-martial?—It is different in the different grades of courts-martial. In regimental courts-martial it goes direct to the lieutenant-colonel, or officer in command of the regiment for the time being, who confirms the proceedings. With regard to the district court-martial it goes for the perusal of the major-general or other officer commanding the district or garrison, in fact, to whoever convenes it, and he confirms the proceedings or orders the revision of the court, as the case may be.

1061. But in no case is the finding or sentence promulgated, or even known, until it is confirmed by the confirming officer?—Not until it is confirmed.

1062. Would you see any objection to the finding and sentence being made known at once, of course not to be carried into effect until confirmed?—Yes, I see great objections to altering the present system.

1063. Of what kind?—Supposing the case were one of conviction, and a certain sentence of imprisonment, and it went back for revision, and on revision the court were induced to change their finding, I do not think it would have a good effect; and especially in the opposite case, where an acquittal had been obtained, and afterwards on revision a conviction was obtained and the man sentenced to imprisonment. If the first finding were promulgated the man would think that he was quit of it, whereas he would not be really quit of it at all. It would be giving him a false hope.

1064. But do you not think that the present system interferes with the independence of the court?—I think that if they were allowed to talk about it they would be much more likely to be influenced by people who had not been present upon the proceedings, and who were not perfectly conversant with what had been stated on oath.

1065. But it would be only known and talked about after the court had come to its finding?—Yes, but it might not be its final finding.

1066. But have you known such cases as that which you instanced just now, where a court have acquitted a prisoner, and on revision had found him guilty?—Frequently.

1067. Do you think that that is quite just?—Certainly, I think so.

1068. When a finding of acquittal comes back from a confirming officer for revision, is it not almost an instruction—I will not say an order—from that superior officer that the finding should be reversed?—I do not think that it has much weight with the court. The courts are very independent.

1069. But do you not think that it tends to impair their independence?—I think not. It generally puts their back up.

1070. (*Mr. Mowbray.*) As a matter of fact, generally speaking, courts "respectfully adhere to their "finding," do they not?—They do. I will not say that it frequently occurs, but I have known it certainly fifteen or sixteen times in my experience in Ireland that courts on revision have given a finding of "guilty" where they have formerly had a finding of acquittal.

1071. (*Mr. Russell Gurney.*) Does it somehow or other generally become known that there has been a finding of acquittal first?—It is generally known in this way, that there is no evidence taken as to character or former convictions, and therefore everybody knows when there is an acquittal, because the proceedings stop with the finding. When a finding is sent back the proceedings are generally sent back with a letter pointing out certain portions of the evidence to the court, and requesting them to reconsider their former finding.

1072. (*Marquis of Hartington.*) Do you think that any practical inconvenience would result if the power of reconsidering the finding was altogether to cease?—I should be sorry to see it taken away.

1073. Do you think that courts-martial are apt to make mistakes even in such a case as the difference between a finding of "guilty" or "not guilty"?—They are indeed.

1074. (*Chairman.*) Have any of those cases of which you have just spoken been of a very serious nature?—Some of them have been so.

1075. (*Lt.-Gen. Eyre.*) Do you undertake to give any opinion at all upon the minor crimes and punish-

ments dealt with by the commanding officers of regiments?—No.

1076. (*Marquis of Hartington.*) Is it not the fact that in civil cases the jury can never be called upon to reconsider its verdict?—It is so; but the difference between the civil and military tribunals is, that the civil tribuuals are always presided over by some person more or less acquainted with the law, who directs the jury and points out the legal value of the evidence; whereas the military tribunal is occasionally presided over by a person who has no knowledge of law, and is unable to point out those differences in the value of the evidence.

1077. Is not what you said just now an argument against the efficiency of courts-martial as just tribunals altogether?—I think that you must try military offenders by military courts for military offences. You could never get civilians sufficiently cognizant of the practice and custom of the service and of the ways and habits of the soldiers to enable them to take the place of the military tribunals, even though they may be a little less efficient than those presided over by civil officers. I should like even to see a military officer of high rank and long experience in command of a regiment attached to the Judge Advocate General's office to assist him and advise him.

1078. (*Lt.-Gen. Eyre.*) You have said that it sometimes happens that the general officer or the other confirming officer returns for revision a court-martial which finds prisoner "guilty" when he considers him "not guilty"?—Yes.

1079. On the other hand, do you think that there are many instances of a general returning for revision courts-martial where the court acquitted the prisoner, because he thinks in his mind that they are mistaken, and that the prisoner is guilty?—I think he returns it in every case whenever there is the smallest legal mistake.

1080. My object is to ascertain whether the courts-martial lean in a general way rather to the acquittal of the prisoner, if possible, than to finding him "guilty"?—It is difficult to say. I am afraid that the court is rather apt to assume that a man is "guilty," because a case is very seldom sent to trial except they are pretty certain of a conviction.

1081. Is it, or is it not your impression that courts-martial are influenced in that way, and that where there does appear the slightest opening for finding a man "not guilty" they take that view?—Yes, I think they always lean towards a prisoner if they get a chance.

1082. Are you acquainted at all with the practice of civil courts, either by acting as a magistrate or in any other way?—I cannot speak of my own knowledge as to the practice in civil courts.

Lt.-Col. the Hon. W. H. A. Feilding.

30 March 1868.

1083. You cannot say, in comparing the two, whether courts-martial are less just towards prisoners than civil courts?—I think that there is no fairer tribunal in the world than a court-martial properly conducted.

1084. (*Lt.-Gen. Peel.*) Are you aware in any instance of the proceedings of a court-martial having been revised since the appointment of Deputy Judge Advocates, and in cases where they have been present?—I cannot recollect any case. I am not aware of any such case having occurred.

1085. Therefore the necessity of sending the proceedings of a court-martial back for revision generally arises from the absence of any person from that court-martial who is acquainted with the legal points, and with the value of the evidence?—Yes.

1086. (*Marquis of Hartington.*) Is not the sentence often sent back for revision as being inadequate?—Not often; and I would very seldom recommend that to be done, because it is a snub to the court, which is unnecessary, for the General can always confirm the proceedings, and then remit a portion, or he can confirm the whole proceedings without remitting on the face of the proceedings, and remit part of the punishment afterwards.

1087. Have you known cases when a sentence has been sent back for revision by the confirming officer on account of its inadequacy?—I have.

1088. In such instances has the sentence been increased in severity?—I can call to mind several cases in which it has.

1089. Do you think that that is a desirable power for the confirming officer to have?—I think that it is a desirable power, but it is very seldom used, because it is undesirable at any time to find fault with a court-martial if you can possibly help it.

1090. (*Lt.-Gen. Peel.*) And it is always in the power of the court to refuse any increase of punishment?—Yes.

1091. (*Marquis of Hartington.*) But the confirming officer is always a superior officer to any member of the court, is he not?—Yes.

1092. And therefore the fact of his sending back a sentence or finding for revision is a kind of instruction on his part as to what he wishes the court to do, is it not?—Some commanding officers may word their letters in that way, or cause their lettters of revision to be worded in that way; but it is very undesirable to allow the letter to have the smallest semblance of an order. It is merely to point out things which do not appear to have struck the court. It requires the greatest possible care in writing the letter, so as not to appear to convey the smallest order or even censure.

The witness withdrew.

Col. Joseph Henry Laye called in and examined.

Col. J. H. Laye.

1093. (*Chairman.*) What post do you hold at present?—I am Deputy Judge Advocate of the London district.

1094. How long have you held that post?—For three years.

1095. Had you held any similar post before?—I had acted in the capacity of Judge Advocate before, and as president of general courts-martial.

1096. For how long a period?—I have been thirty-four years in the service.

1097. How much of that time has been devoted to duties of that nature?—I cannot say as to any particular periods, because it was at different times that I performed the duty; but I was not specially appointed until within the last three years.

1098. I presume that, in the performance of your duties, you have had rather an extensive experience with regard to courts-martial?—I have.

1099. This Commission has directed its inquiries in the first instance to the composition of courts-martial; have you from your experience any suggestions to make with regard to the composition of the court?—I should be very much inclined to let them remain much as they are. Perhaps the number on a general court-martial might be reduced to nine with advantage.

1100. With regard to district courts-martial, would you suggest any alteration?—I should let the district courts-martial and the regimental courts-martial remain as they are.

1101. One of the previous witnesses has suggested as a defect in the regimental courts-martial that they are composed of inexperienced officers, and that their judgments vary very much. Do you agree in that?—No, I do not. I have found, generally speaking, that the young gentlemen in the army in the course of a very little time become very efficient.

1102. Have you any suggestion to make with regard to the present mode of the prosecution at courts-martial?—Yes; I think that on general courts-martial the prosecutor should generally be the commanding officer of the regiment to which the prisoner belongs.

1103. In your opinion should he appear at each court-martial as prosecutor?—At the general courts-

Col. J. H. Laye.

30 March 1868.

martial; but at district or regimental courts-martial the adjutant should act as prosecutor.

1104. And you think that the colonel of a regiment to which the officer belongs should be the prosecutor in all respects?—Yes; I think there should be a general order to the effect that they would be held responsible for getting up the case properly, and that more responsibility should be thrown upon them.

1105. What, according to your experience, is the practice now in appointing the prosecutor?—Generally it is the adjutant. I have seen instances in which an officer has been selected at a moment's notice, who is quite ignorant of the case.

1106. (*Lt.-Gen. Scarlett.*) In a general court-martial?—Yes, in a general court-martial.

1107. Are you speaking of courts-martial on officers or on men?—I am generally speaking of courts-martial on men.

1108. (*Chairman.*) Do you think that that is an objectionable practice?—Very much so.

1109. Is it always in the power of a commanding officer to take upon himself the duty of prosecutor?—I should think that it ought to be.

1110. Are there not some officers who are subject to courts-martial who are not under the command of a colonel of a regiment; for instance, there are officers connected with the War Office who may be tried by court-martial, may they not?—Yes.

1111. Whom would you appoint as the prosecutor in a case of that kind?—I would select an officer from the district staff.

1112. Do you recollect any other officers who are subject to be tried by court-martial who are not under the immediate command of the colonel of a regiment?—Yes, there might be the medical staff and commissariat officers.

1113. Whom would you recommend to prosecute in those cases?—The General would naturally select one of the officers of the district staff, either the assistant adjutant-general or the brigade major.

1114. The appointment of prosecutor in every case then, excepting that of an officer belonging to a regiment, you would leave to the discretion of the General of the district?—I would.

1115. Is that so now?—I think it is, so far as my experience goes. The general officer would select the prosecutor if the prisoner was not connected with any regiment.

1116. Do you suggest any alteration at all as to the appointment of a prosecutor?—With regard to a regiment I should.

1117. How long has the present practice of appointing a prosecutor existed?—As long as I can remember in the service.

1118. But at the same time the duties and relative positions of prosecutor and of Deputy Judge Advocate have been altered very much lately, have they not?—They have.

1119. Is not greater duty thrown upon the prosecutor by the fact that for some years past there has been an alteration in the system as regards the appointment of Deputy Judge Advocate?—Yes. Formerly the Deputy Judge Advocate was prosecutor, but now it is not so.

1120. (*Mr. Mowbray.*) At the time when the Deputy Judge Advocate acted as prosecutor he brought a certain amount of legal knowledge to bear on getting up the case for the prosecution, did he not?—Yes.

1121. Was not that an objectionable practice?—Yes, it bore hardly against the prisoner.

1122. But the prosecutor being no longer Judge Advocate, do you think he is apt to get up his case so well?—No.

1123. And in fact the system prevailing for the last few years has led to the cases not being got up with such care and accuracy as formerly?—I should not like to see the Deputy Judge Advocate return to the duties of prosecutor; I think that the case would be met if a general order was issued, that whoever acted as prosecutor should be responsible for being thoroughly up in his case.

1124. (*Chairman.*) Have you any suggestion to make with regard to the summoning of witnesses?—Yes, by the Articles of War in general courts-martial the Judge Advocate has to summon them, and I think that that is very objectionable.

1125. Why do you think it objectionable?—Because he may not be on the spot. For instance, I might be at Pembroke, and a general court-martial might be ordered at Aldershot, and civil witnesses be required; there might be delay if I did not know their names and addresses. I should suggest that military witnesses should be summoned by the commanding officer of the regiment to which the prisoner belongs. If it was necessary to summon any general officer or any officer of rank, or any civilian, it might be done through the general of the district. For instance, supposing that the colonel of a regiment wished for the attendance of a general officer, it would not do for him to send a summons, say, to Sir James Scarlett.

1126. Do you know the cause of the present regulation with regard to the summoning of witnesses?—I suppose it originated when the Judge Advocate was always the prosecutor.

1127. Have you any suggestions to make with regard to the defence of the prisoner?—I think that in a general court-martial the man should always be attended by an officer of his own regiment to watch the case for him, and if necessary to suggest to him questions in the cross-examination of witnesses, and also to assist him in preparing his defence.

1128. You do not think that it would be advisable to allow every prisoner to have legal advice?—A prisoner is allowed to have legal advice, if he chooses to obtain it.

1129. Do you see any objection, when a prisoner has legal advice, to his legal adviser having the power of addressing the court?—I do.

1130. What, in your opinion, is the objection?—I think that it would be regarded as very objectionable by military men. As it is now, the legal adviser has the power of assisting the prisoner in every way by advising him silently, and by suggesting questions to him.

1131. In carrying out the suggestion which you have just now made, that an officer of the prisoner's regiment should be present on all occasions to assist him in his defence, do you see any objection to that officer addressing the court on his behalf?—I should not allow anybody to address the court. I would allow any officer to read the prisoner's defence if he had one written out.

1132. But at the present moment the prosecutor is allowed to address the court, is he not?—Yes.

1133. Would it not be fairer towards the prisoner to give him the same advantage for his defence which the prosecution has?—I think that the prisoner might have an address written for him by his legal assistant, which he would be able to read out himself as his address, or have it read by an officer or soldier friend.

1134. But is there not some advantage to be derived from the address being made by a person competent by education and talent to give it more weight than can generally be given to it by the prisoner?—No doubt it would have more weight.

1135. But is not that the weight which is enjoyed by the prosecution?—It is; but the prosecutor's legal assistant would not be allowed to address the court, and the prosecutor would most probably be a military man.

1136. (*Mr. Mowbray.*) But the prosecutor is a man of education, whereas the prisoner, in most cases, supposing him to be a private, is an illiterate man?—Yes.

1137. (*Chairman.*) Are you still of opinion that it is not advisable that anybody but the prisoner should address the court for the defence?—I think not; I think that if an address was written for the prisoner

by his legal adviser, the prisoner would then read it himself.

1138. (*Mr. Mowbray.*) Do you not think that it would be well that it might be read for him by an officer of the regiment?—I should have no objection to that.

1139. (*Chairman.*) It is a common practice I believe at the present moment for the prisoner to have his defence drawn up, either by a legal or lay adviser, according to his judgment, for his defence?—Yes.

1140. Would you object to the additional privilege on the part of the prisoner of having that defence read by an officer of his own regiment?—Not at all.

1141. From your experience have you found that courts-martial are guided strictly and entirely by the Mutiny Act and the Articles of War?—I should say that they are generally.

1142. Do the Queen's Regulations never enter into the consideration of the court?—Occasionally; but the chief authority is the Articles of War.

1143. You think that at the present moment the court never take into consideration the Queen's Regulations?—I think not as regards awarding punishment; that is provided for by the Articles of War.

1144. In the conduct of a prosecution are the Queen's Regulations ever brought under consideration?—Occasionally.

1145. Are courts-martial guided solely by the Mutiny Act and the Articles of War?—They ought to be so.

1146. In your experience do you know of any instances where they are not so guided?—I do not, except in those former cases with regard to corporal punishment, where according to the Articles of War you might award corporal punishment for a certain offence, but according to the Queen's Regulations you could not do it, unless the man was in the second class.

1147. That is a regulation entirely in favour of the prisoner, is it not?—It is so, certainly.

1148. Have you any suggestions to make with regard to the position of the Deputy Judge Advocate on a court-martial?—I think that he ought not to be under the rank of a substantive or regimental lieutenant-colonel.

1149. Why do you entertain that opinion?—Because I think that he generally ought not to hold any less rank than the president. In all general courts-martial the president is at least a regimental field officer, and by the regulations he ought to be a full colonel; it does not very often happen, but the president if of slightly superior rank might have a disinclination to be guided by the Judge Advocate. On trials where the president is a general officer, I should not anticipate any such difficulty.

1150. Are the Deputy Judge Advocates generally men of considerable experience?—I presume that they have been so, or else they would not have been appointed.

1151. An officer may be appointed temporarily as Deputy Judge Advocate, may he not?—They have been so appointed; but I do not think they would be now, because we receive deputations from the Judge Advocate-General for certain districts.

1152. Up to the present time the office of Deputy Judge Advocate has not been necessarily an office by itself, has it?—Not until within the last three years.

1153. Previously to that period might any officer be appointed Deputy Judge Advocate?—He was selected by the general, or the officer commanding the station, and his name would be submitted to the Judge Advocate-General, who then would give him a deputation. Therefore the appointment rested with the officer commanding the station.

1154. Is there any law which forbids the appointment of Deputy Judge Advocates as formerly being carried on now?—I do not think there is any such law.

1155. Do you think it advisable that any alteration should be made in the present practice of the appointment of Deputy Judge Advocates?—No, I do not see that it is.

1156. The present practice being that there are two district Deputy Judge Advocates in England and one in Ireland?—Yes.

1157. But you would reserve the old power to the Judge Advocate-General to appoint any other person if there should be any necessity for it?—Certainly.

1158. The only suggestion then that you make is that the Deputy Judge Advocate should be of the rank of lieutenant-colonel?—Yes, so as to be in an equal position with the president.

1159. From your experience of the officers who compose courts-martial in general, are they in your opinion sufficiently acquainted with their duties?—Generally speaking, I should say they are.

1160. Do you think that any alteration should be made in the present regulations with regard to the examination of officers before they are admitted to sit on courts-martial?—I am of opinion that every officer before he is allowed to sit on a court-martial should be examined on the Articles of War and the Mutiny Act, and the powers and practices of courts-martial, by a Board of Field Officers.

1161. The present regulation I believe is, that no officer can sit on a court-martial unless he has had an experience of six months in all the courts-martial of the district in which he is quartered?—Yes, I apprehend that alludes to the sitting of supernumeraries on regimental courts-martial.

1162. Would that be sufficient?—I think so quite, but I recommend that he should be examined by a Board of Field Officers, but some officers might be ready in three months.

1163. (*Mr. Russell Gurney.*) Do you think that it would be desirable that that should form any part of the examination of an officer before he has his commission?—No, I should think not. It is too far in advance.

1164. (*Lt.-Gen. Scarlett.*) Do they not undergo an examination upon promotion from ensign to lieutenant and from lieutenant to captain?—They do.

1165. And are not the Articles of War and the Mutiny Act made a subject for that examination?—Yes.

1166. (*Chairman.*) You are of opinion that no alteration is required as to qualifications except that the officers should be examined by a Board of Field Officers?—Especially on this particular branch, the Articles of War and the Mutiny Act.

1167. According to present regulations they are examined, if at all, by the colonel of the regiment, are they not?—Yes, or perhaps by a Board of Field Officers, a major and two captains for promotion, and the Articles of War and the Mutiny Act form a portion of that examination, but perhaps not so much as is desirable.

1168. (*Lt.-Gen. Scarlett.*) You would make it a more formal examination?—Yes, a stiffer examination.

1169. (*Chairman.*) With regard to the composition of district or garrison courts-martial, have you any alterations to suggest?—I think the garrison or district courts-martial should always be composed of officers of different regiments. It may occur, and it has occurred frequently, that a garrison or district court-martial has been composed entirely of officers of the same regiment, and I think that is very objectionable, unless it is abroad, where any other arrangement could not be carried out.

1170. On foreign stations and in our colonies that of course could not be carried out?—No, it could not be carried out.

1171. But wherever it is practicable you recommend that the court-martial should be composed of officers of different regiments?—Yes.

1172. Would you suggest any proportion in which those officers should be selected?—There might be not more than two or three officers out of the regiment. The prisoner would be allowed to object to them if he chose.

Col. J. H. Laye.

30 March 1868.

1173. Have you any suggestions to make with regard to the punishments awarded by those courts-martial?—I think that the punishments might be of a lesser degree, and that the imprisonment should not be of so great an extent.

1174–6. But have not the courts-martial the power of awarding shorter or longer punishments?—Yes; but I have frequently seen a man get, in perhaps some simple case, 168 days' imprisonment, and I think that is too much for minor offences.

1177. (*Lt.-Gen. Scarlett.*) Do you find a great difference in the sentences of courts-martial, the crime and the character being pretty nearly the same?—Frequently.

1178. (*Chairman.*) From what do you think that arises?—From the court which is sitting to try the case. There are men who have stricter ideas of discipline than others, and if there happen to be seven men with very strict ideas of discipline they would, perhaps, give a heavier sentence.

1179. Do you think it would be possible to adopt a more regular scale of punishments than is now in force?—I think it would be a very difficult thing, considering the number of offences for which men are tried.

1180. You do not think that it would be possible to prevent that evil that we have just alluded to?—I think that evil is met by having the supervision of the General of the district. If he sees the court giving too severe a sentence he is able to mitigate it, and I have seen it frequently done.

1181. (*Mr. Russell Gurney.*) Do you think that in courts-martial there is a greater variety of punishment than there is by our civil judges for the same same offences?—I do not think there is, but I think we have a greater variety of trivial offences.

1182. (*Lt.-Gen. Scarlett.*) Could you propose any plan by which the punishments could be dealt out more equally by courts-martial?—I do not think I could.

1183. (*Lt.-Gen. Eyre.*) Are the punishments now in force effectual?—I should think they are.

1184. (*Maj.-Gen. Horsford.*) As the whole court act as a jury, do you think that the three seniors might act as judges and might sentence the prisoner, the younger members of the court not being allowed to vote as to the sentence?—I would rather see it stand as it is.

1185. (*Viscount Eversley.*) As Deputy Judge Advocate I believe you do not see the proceedings of district courts-martial until after they have been confirmed by the confirming officer?—No.

1186. Would it not be desirable that you should see them before they are confirmed by the confirming officer?—I think it would.

1187. Do you think that would be an improvement in the system?—I think it would.

1188. (*Chairman.*) With regard to the punishment of non-commissioned officers by courts-martial, have you any alterations to suggest?—Yes; I think that courts-martial ought to have discretionary power to reduce staff serjeants to be company serjeants, and I should also suggest that courts-martial should have discretionary power to reduce a serjeant to a corporal or to the bottom of the list of corporals.

1189. (*Maj.-Gen. Horsford.*) Do you not think that the majority of general officers select a man whether he is at the bottom of the list or at the top, if they want to get a good regimental serjeant-major?—Yes.

1190. The colonel selects a smart man whom he has found who was at the bottom of the list the other day, and immediately makes him serjeant-major in preference to any other?—Yes.

1191. And therefore reduction from the top of the list of serjeants to the bottom would be of no advantoge?—I do not say that you should put him at the bottom of the serjeants, but at the bottom of the corporals.

1192. (*Lt.-Gen. Scarlett.*) You would deprive him of rank?—I would deprive him of rank.

1193. (*Chairman.*) Would you apply that rule to a serjeant-major?—I think it would be sufficient to reduce him from serjeant-major to serjeant.

1194. And you would apply the same rule to them all, of placing them in the next rank below their existing rank?—Yes.

1195. (*Mr. Mowbray.*) But you would do that without necessarily reducing a man to the rank of private?—I would.

1196. (*Chairman.*) Do you think that the punishment of stoppage of pay might be applied to the non-commissioned officers of a regiment?—I do not.

1197. Why do you think that that would not be a punishment suitable to a non-commissioned officer?—Because I think a non-commissioned officer has a certain position to keep up, and he requires all the pay he is possessed of to keep himself in that position.

1198. Have you any other suggestions to make to the Commission with regard to the constitution and the practice of courts-martial or as to the punishments inflicted by those courts?—Not any more than what I have stated.

1199. (*Mr. Mowbray.*) With respect to the preparation of charges, they are prepared at present in the case of general courts-martial at the Judge Advocate-General's office; would you not think it a great advantage if they could be prepared, say, at the Adjutant-General's office?—I think it would; first of all, they are made out at the regiment and then they are submitted through the General of the district for approval to the Judge Advocate-General, who alters them or lets them stand as they are and returns them.

1200. (*Chairman.*) That is in the case of general courts-martial only?—Yes.

1201. (*Mr. Mowbray.*) But they are submitted to the Judge Advocate-General before the prisoner is put upon his trial, are they not?—Yes.

1202. Would it not be better that the Judge Advocate-General should never see them until the case comes finally before him for decision, so that he should approach them with a perfectly impartial mind, and that he should in no sense be committed to the charges?—Yes, I think it would; but in that case he must have some one appointed who is thoroughly up to framing the charges legally.

1203. You think that there should be somebody attached to the Adjutant-General's department in the nature of a clerk of indictments who should prepare the formal charges?—Yes.

1204. With regard to the prosecution, you think that there is greater strength required to get up the prosecution since the Judge Advocate has ceased to take part in its preparation?—Yes, officers I think are very seldom up in performing that duty.

1205. With respect to the practice of writing down the questions and answers, do you think that is a desirable system?—I think so; I should be very sorry to see it done away with, because, unless the questions and answers are written down, I do not see how the Judge Advocate-General or the General of the district could form his opinion of the proceedings.

1206. Do you think it necessary that the questions should be put in writing to the witness, or that the questions might be put orally to the witness, but taken down by a shorthand writer, so that the confirming officer in revising the proceedings might still have a written record?—In very simple trials, such as the case of a man deserting, the questions are not always written down and handed to the president, but they are always written on the face of the proceedings.

1207. With respect to the time occupied, do you think that it would be a great advantage that the court should be enabled to sit after four o'clock?—In some instances it would be an advantage, but I should be sorry to see the proceedings extend over a greater length of time, because I think if officers sit from nine o'clock in the morning to four o'clock their attention would be pretty nearly exhausted. Ten o'clock, however, is a more usual hour for the court to meet.

1208. I belive that in some respects the time which the trials occupy has been shortened by the adoption of printed forms which have been introduced within the last twelvemonths?—Very much so. I may also add that the trials have been very much shortened by the Deputy Judge-Advocates of districts being paid by the year instead of being paid by the day, as formerly was the case. Trials are now got over in a much shorter time.

1209. As to the accuracy with which trials have been conducted since the appointment of Deputy Judge Advocates, three years since, do you know what number of decisions of general courts-martial have been sent back for revision since that change?—Yes, I can state that one only has been sent back.

1210. Was that a case where the court, contrary to the advice of the Judge Advocate, passed a sentence which they were not legally competent to award?—It was in opposition to the advice of the Deputy Judge Advocate.

1211. So that since that appointment of district Deputy Judge Advocate there has not been a single miscarriage of justice?—Not in my district, or that I know of.

1212. Nor so far as you know of through any fault on the part of the Judge Advocate?—Certainly not. I was disarmed in that particular case at the moment, because the instructions which give greater strength to the position of Judge Advocate were then in abeyance pending an alteration which was being made.

1213. You stated that you think it would be advisable that the proceedings of district courts-martial should be submitted to the Deputy Judge Advocate of the district before the confirmation of the confirming officer; do you think that could be done in a reasonable time?—The Judge Advocates would require to have greater assistance; in fact they have no assistance now in their offices, and it would be impossible that the Deputy Judge Advocate of a district could do that unless he had some assistance.

1214. I believe it is done in India?—I cannot speak about India.

1215. You think it would be very desirable that it should be done, and that in order to enable it to be done, so that the sentence might be promulgated, the staff of the Deputy Judge Advocate must be strengthened?—Very much. I think it would entail certain delays, because if the Deputy Judge Advocate is employed on a general court-martial for two or three days his attention might be otherwise engaged than in perusing the proceedings of this particular court-martial.

1216. But you think that any expense attendant on any such proceeding would be more than compensated by the greater accuracy of the proceedings?—I do not know; but it would save the Generals of districts much trouble, because they would have the proceedings come to them complete.

1217. At present if the General commanding a district is in any case in any difficulty he writes a letter to the Judge Advocate-General for his advice before confirmation, does he not?—He does.

1218. But in this case he would always have the advice of the district Deputy Judge Advocate, as a matter of course before proceeding to confirm?—Yes, at first hand.

1219. And then the Judge Advocate-General would remain in the nature of a Court of Appeal?—Yes, the same as he is now.

1220. (*Lt.-Gen. Eyre.*) General courts-martial have very often attracted public notice by the length of time they have taken up; to what is that delay chiefly attributable in your opinion?—The only delays that I have known of late have been those in India or Jamaica; those I cannot speak of. I am not aware of any delay which has taken place in England. The delay which took place in courts-martial before my time as Deputy Judge Advocate was, I presume, in consequence of the number of witnesses that were called.

1221. (*Lt.-Gen. Scarlett.*) Does the mode of taking down the questions and answers lengthen the proceedings?—I cannot say that it does. I should be very sorry to see it done away with.

1222. (*Lt.-Gen. Eyre.*) Are the crimes tried by general court-martial chiefly somewhat exceptional in their nature; and do they therefore require more legal treatment and knowledge than other questions?—Yes.

1223. For example, very frequently paymasters or quartermasters are tried for what are in fact half civil and half military offences, are they not?—Yes, they could only be tried by a general court-martial.

1224. (*Mr. Russell Gurney.*) Are not charges of embezzlement frequently tried by courts-martial?—They are.

1225. Do they take a very long time?—Sometimes they do.

1226. Do you think there would be any objection to such crimes being tried by an ordinary criminal court?—I am not aware that there would be any objection to turning the soldiers over to the civil power.

1227. (*Lt.-Gen. Scarlett.*) Would those trials be more expensive to the country than if they were tried by court-martial?—I should think they would, certainly.

1228. (*Mr. Mowbray.*) Have you generally found that a court-martial is an imperfect tribunal to deal with cases of embezzlement and cases involving matters of account?—I think it is generally.

1229. There is great difficulty generally in giving legal proof of the offence, and as a matter of fact the proof is generally deficient, is that so?—It is not so far deficient that the court do not generally come to a finding.

1230. But it frequently happens, does it not, that that finding is not thoroughly supported by strictly legal evidence?—Yes.

1231. And that not so much from any want of desire to do justice as from the tribunal being imperfectly acquainted with the rules of legal evidence?—Yes.

1232. (*Lt.-Gen. Eyre.*) Although your duty does not extend to regiments, you are well acquainted with the regimental practice, are you not?—I am.

1233. With regard to regimental courts-martial, do you think that it would be possible, for instance, to have one of the captains of a regiment invited to go to the staff college, or wherever else he could get the necessary information, and to make himself acquainted with sufficient military law for the purpose, and for him then to be excused from some of his other duties, so that he might act in regimental courts as assessor, or whatever term may be given to it?—No, I think it is very well met by the adjutant acting as prosecutor, if the commanding officer makes the adjutant do his duty properly, because the cases are generally so very simple which are tried by regimental court-martial.

1234. (*Chairman.*) Do you think that the abolition of corporal punishment would be attended with any inconvenience to the service?—I think it would, most decidedly. It is never inflicted except upon men of very bad character.

1235. For insubordination, for instance, do you think that there is any punishment which could be substituted for it with equal efficacy?—No, corporal punishment can be inflicted there and then, and all the other men see it; but if a man is sentenced to penal servitude or imprisonment for insubordination, the sentence is read out and the man disappears.

1236. Are you at all acquainted with the nature of the punishments in foreign armies?—No, I cannot speak exactly as to them; but I only the other day heard of a punishment existing in the American army, which was that the man was triced up by his wrists to the ceiling, the tips of his toes touching the ground, for a very trivial offence.

1237. (*Mr. Russell Gurney.*) Was that in time of peace?—It was within the last 12 months.

Col. J. H. Laye.

30 March 1868.

1238. (*Chairman.*) Are you acquainted with the system of punishment which is in force in the French army?—I am not; but I can state that where we should perhaps flog a man they shoot him.

1239. But you cannot speak as to that from personal knowledge?—No.

1240. (*Mr. Whitbread.*) You cannot say how many men were shot in the last year?—I cannot.

1241. Did you hear Colonel Feilding's evidence just now?—I did.

1242. Do you agree in the main with what he stated with regard to the infliction of corporal punishment?—I do.

1243. (*Mr. Russell Gurney.*) You mentioned just now, did you not, that corporal punishment was never inflicted except on persons of very bad character?—I think never.

1244. Then would you see any objection to its infliction being forbidden in the case of men of one class, that class consisting of persons who had not been reduced for misconduct, because, supposing that there were two classes, there would not be persons of very bad character in the first class?—There might be persons of very bad character in the first class. If a man was quite clear for 12 months he would regain his position as a first-class man, and the next day he might be guilty of a gross act of insubordination.

1245. But is it within your experience that persons of very bad character become subsequently good soldiers?—I do not think that they are made worse by receiving corporal punishment.

1246. It was mentioned by Colonel Feilding that there were cases within his own knowledge of persons who had been flogged and who had been subsequently very good soldiers; is that likely to be the case where those persons who were flogged were persons of very bad character?—Not all of them.

1247. Then is it not very desirable to get rid of such persons from the regiment?—They generally are got rid of. They are tried by general court-martial, and a man of very bad character is sentenced to corporal punishment and discharged the service with ignominy.

1248. (*Mr. Whitbread.*) You say that corporal punishment is confined to persons of very bad character. By the Mutiny Act of last year it appears that it was confined to two crimes, mutiny and insubordination with violence. If a man previously of very good character had been convicted of striking his officer would he be subject to corporal punishment?—He would be subject to it, and probably be sentenced to it; but I think the chances are that he would get penal servitude.

1249. (*Mr. Russell Gurney.*) Would that be considered as being the more severe punishment of the two?—Yes. Where you require corporal punishment is where it must take place at once. It depends upon the character of the man. At a general court-martial not long since a man was tried for insubordination with violence for stabbing a corporal, and he got 12 months' imprisonment, in consequence of mitigating circumstances.

1250. (*Mr. Whitbread.*) Assuming this punishment to be abolished, would it not be necessary to provide some means of getting rid of bad characters more easily than you can do at present?—Any general court-martial can get rid of a bad character if he is tried.

1251. Do you not think that it will be necessary to have resort to getting rid of bad characters more frequently?—I think that commanding officers have resort to a measure of the kind by bringing a man to a general court-martial for that very purpose.

1252. (*Lt.-Gen. Eyre.*) But is it not the great complaint of commanding officers that they cannot get rid of their bad characters without so much difficulty?—I have not heard it, and as Deputy Judge Advocate I have attended several general courts-martial where men have evidently been tried by that tribunal in order to have them discharged.

1253. (*Mr. Whitbread.*) Do men look forward to the punishment of imprisonment with much dread?—I have heard that men do so, not so much the first time; but if they go back to some of the military prisons they do the second time.

1254. You mean that after having had experience of one term of imprisonment they do not like to go back to prison?—They do not like to go back to the prison because their character is known. A man when he is first imprisoned may be, perhaps, put on lighter work, but if he goes back a second time he knows that he will not get those indulgences.

1255. (*Chairman.*) Have you any other general suggestions to make to the Commission?—In regard to habitual drunkenness, I think that as men have increased pay now the power of the regimental and district courts-martial should be greater as to stoppage of pay, and that they should be able to stop twopence instead of a penny. The full extent to which a man may be sentenced now is threepence a day. I would increase that to sixpence by a series of courts-martial. Supposing a man is sentenced to stoppage to the extent of threepence a day by three different courts-martial, that is all they can give; but I say that a court-martial ought to be allowed to place men under stoppages of twopence a day for each conviction, not exceeding in the aggregate sixpence.

1256. Would not that come rather hard on the captains of companies?—I am not exactly aware whether it is stopped at the end of the quarter or at the beginning.

1257. But it would be stopped by the day, would it not?—I do not think that it would be hard for the captains of companies, because they estimate the pay for the month, and as they have nothing to pay the man until he comes out of prison, it would not be out of the captains' pockets.

1258. (*Lt.-Gen. Scarlett*). Do you think that any advantage would be gained by having permanent courts-martial, consisting of the same president and of the same members sitting in different districts, instead of selecting them by roster as at present?—I do not know how you could carry it out, excepting in some very large districts.

1259. In London?—Yes, and in the northern districts, in Manchester, and at Aldershot.

1260. So that you might send a prisoner to London, or to Aldershot, or to Manchester, according to the district?—It would be attended with a great deal of expense.

1261. But do you think that any advantage would be gained as to the quality of punishment?—I think that the punishments would be more equalized.

1262. Those members would be more habituated to sift evidence, and do you not think that they would perhaps come to better conclusions than they do at present as to finding "guilty" or "not guilty," and also as to awarding punishment?—The awarding of punishment might be more equalized, but I do not think that the finding of "guilty" or "not guilty" would be improved. I think that nothing can be fairer than the decisions of courts-martial, and I do not think that it would be a popular thing for the men. I have here a memorandum for the last two years of the courts-martial in the London district. There were 2,281 courts-martial in 1866, of which 900 were for desertion, 221 for insubordination and drunkenness, 306 for drunkenness, and 875 for miscellaneous offences.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Room E., House of Lords.

Thursday, 2nd April 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

VISCOUNT EVERSLEY.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
MAJOR-GENERAL SIR ALFRED HASTINGS HORSFORD, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
COLONEL S. N. LOWDER, C.B.
CAPTAIN THE HON. J. C. W. VIVIAN.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

LIEUT.-GENERAL LORD WILLIAM PAULET, K.C.B., examined.

Lt.-Gen. Lord W. Paulet, K.C.B.
2 April 1868.

1263. (*Chairman.*) It is scarcely necessary to ask your Lordship whether you are Adjutant-General of the Forces?—I am.

1264. How long have you held that office?—For three years on the first of July next.

1265. Has your attention been directed very much during that time to courts-martial?—Yes, though perhaps not really so much as it would be when in the command of a district as I was for some time.

1266. I believe that you had held the command of a district previously?—Yes; I have been for 13 years uninterruptedly in command somewhere.

1267. Will you favour the Commission with your opinion as to the constitution of the several branches of courts-martial, and whether you think that any alteration, first of all, in the constitution of any of those courts is desirable?—I do not think that there is much necessity for that, but if you could simplify the Articles of War a little it would be as well, and if you made them perhaps a little more concise and a little more definite.

1268. In what respect do you think the Articles of War are deficient?—I think that the Articles are unnecessarily long, and there is a great deal of repetition.

1269. Do you think that that leads to confusion in the conduct of the courts?—I think it may do so a little in the case of young officers, though not in the case of old officers. My impression is that a court-martial should be as much a court of honour and a court of equity, or even more so, than simply a legal court; for I think the prisoners always have a fair trial. If there is the slightest chance of a prisoner getting off, he generally is acquitted.

1270. With regard to the constitution of the general courts-martial, I believe an alteration has taken place within the last few years with regard to the duties of the Deputy Judge Advocate-General?—Yes.

1271. Do you think those alterations have been attended with advantage?—I think with very great advantage. The Deputy Judge Advocate-General is a man with practical experience, and who is constantly in the habit of paying attention to courts-martial, and of course he is better able to give advice, which is very often required. Courts-martial now are becoming comparatively legal courts, instead of everything being left to the discretion of the officers, and it is really necessary to have some one to advise sometimes when a nice point arises. The generality of the cases tried by courts-martial are simple and easy enough; but now and then you get a difficult case, such as, for instance, embezzlement, and some of those cases really require legal advice.

1272. Do you approve of the present mode of appointing the prosecutor in a general court-martial?—I do; I think some one is generally appointed who ought to know the case, or who is supposed to understand getting it up. He is generally an officer on the spot, or the colonel of the regiment, if it is a particular case, will sometimes take the duty himself.

1273. But the practice is not uniform, I believe?—It is not. The adjutant prosecutes in all common cases. I have seen a commanding officer himself prosecute, but it is only in particular cases that he does so. That was in a case where a man appealed against his decision. It is very seldom that a commanding officer does it, and I do not think that it is a good thing for a commanding officer to prosecute, because he may be, perhaps, biassed or prejudiced against the prisoner in some degree, and, perhaps, having investigated the case he is more likely to carry out his own views if he can.

1274. It has been stated in evidence before the Commission that the prosecutor has the power of addressing the court in person previously to the commencement of the proceedings?—That is the case.

1275. It has also been stated that no person can address the court on behalf of the prisoner?—That is so.

1276. Do you think that the service requires that that rule should be still adhered to?—I think it should be adhered to. Generally speaking officers are more inclined to lean to a prisoner who has a common plain defence, which he either speaks or hands in written, than they would be if he had a clever lawyer to advocate his cause.

1277. Do you think that now that shorthand writers are admitted to general courts-martial there is any longer any necessity for every question being put through the president and in writing?—I think so. It must assist the Judge Advocate-General when the proceedings go to him, and I think sometimes if the court do not act properly it enables him to correct it or reverse their error.

1278. You think that is a regulation which is in favour of the prisoner?—I think it is in favour of the prisoner, and it is certainly in favour of justice and in favour of courts-martial being rigidly and properly carried out.

1279. A prisoner is allowed to have a friend in court with him to advise him, is he not?—Yes.

1280. And that friend is allowed to draw up his defence for him; but the prisoner, I believe, must read the defence himself?—Yes, or he may hand it into the court to read.

1281. Do you see any objection to the prisoner being allowed to select any officer of his regiment, or any friend in the regiment, to read his defence for him?—I should not see any objection to that.

1282. And who might assert for him all the privileges which are enjoyed by the prosecutor?—I do not think that his friend ought to address the court, or that anybody ought to address the court, for the reasons which I have stated.

1283. You think that the feeling of the court is more towards the prisoner when his friend has not the power of addressing them?—I think so. In the cases of general courts-martial upon officers, upon several of which I have sat, where a lawyer has been employed in the defence I have seen that he has done the prisoner more harm than good; for generally speaking, although he is well up in law, very often he is not very well up in military discipline, and he very often gets the prisoner into trouble. I think I have oftener seen him do harm than good. A man may be a very good lawyer, but not a good military disciplinarian.

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

You very seldom hear in the service that a soldier complains of not having had fair treatment from a court-martial.

1284. I understand that the examination of a witness must be on paper?—It must.

1285. With regard to the cross-examination of witnesses, do you think that any greater power might be given than exists at present?—In a general court-martial the president can refer to the Judge Advocate-General if he has the slightest doubt as to whether it is a proper question, and he decides whether it ought to be put or not.

1286. (*Lt.-Gen. Scarlett.*) Do you think that if those questions were put *vivâ voce* instead of being written there would be any evil in it?—I think that it is better to have them written, because they put so many questions that people get confused if many of them are not taken down, and some of them are. I would rather have them written.

1287. (*Mr. Mowbray.*) If a shorthand writer were present they might all be taken down, and still a record would remain for the Judge Advocate-General?—Yes; I think that too many questions are very apt to confuse the court. People put such curious questions sometimes, that by obliging them to write the questions, as is the case now, and submit them for the approval of the Deputy Judge Advocate-General, I think you save a great many unnecessary questions being put.

1288. (*Chairman.*) Is is not rather considered that truth is elicited by a variety of questions?—No doubt. I mean if you do not put too many.

1289. And it would be always in the power of the court to check any irrelevant questions, would it not?—Yes, of course; but still I rather like the plan of writing down the questions.

1290. When the prosecutor cross-examines a witness for the defence, does he also put his questions on paper?—Yes.

1291. (*Lt.-Gen. Scarlett.*) So that every question is submitted to the president, either on the part of the prosecutor or on the part of the prisoner, before it is put?—Yes, before it is given out.

1292. Therefore if there is anything illegal in the question, or if there is anything detrimental to the interests of the prisoner or of the prosecutor, the president would stop it?—Yes.

1293. (*Capt. Vivian.*) But the president decides whether a question which is handed in by the prisoner is for his advantage or for his disadvantage?—If the president has any doubt he would hand it to the Deputy Judge Advocate-General and take his opinion upon it.

1294. Has the Deputy Judge Advocate the power of suppressing a question?—No, he has not; but would advise the suppression of a question if he thought it illegal or objectionable.

1295. (*Lt.-Gen. Scarlett.*) But would he suppress it unless it was either wrong in point of law or perfectly irrelevant?—If he said that it was an improper question I should think that the president would not press it.

1296. (*Chairman.*) But the Deputy Judge Advocate would not exercise any judgment with regard to its being of weight in the defence; it is merely on a point of law that he gives an opinion?—It is merely on a point of law or relevancy.

1297. (*Capt. Vivian.*) At present as the court is constituted the Deputy Judge Advocate has the power of suppressing a question put in by the prisoner in his defence, has he not?—He has not the power.

1298. But has the power?—He has not the power.

1299. (*Mr. Headlam.*) As I understand it, he is the person who is to judge of the legality or illegality of the question, unless the court refers it to a higher tribunal?—Yes.

1300. But the president, supposing that there is any doubt of the legality or propriety of a question, takes the opinion of the Deputy Judge Advocate as to whether it ought or ought not to be put?—Certainly, as to the propriety or necessity of a question sometimes.

1301. (*Lt.-Gen. Scarlett.*) In the event of a question being refused and afterwards pressed by the prosecutor or prisoner, what is the custom of the court?—I think that the custom of the court would be to adjourn and refer it to a higher authority. I should do so as president.

1302. Is the court cleared?—The court is cleared, of course.

1303. And is the question then discussed by the court?—The question would be discussed by the court, and if they thought it necessary they would adjourn the court and refer it to a higher authority.

1304. Then not only the president and the Judge Advocate, but the full court have the power of deciding whether the question should be put or should not be put?—I do not think they would put a question if the Judge Advocate decided that it was illegal, for instance.

1305. But if it was rejected upon any other ground but that of illegality, what would occur?—I think the court would overrule the objection, and say that they thought the question necessary if it was only as to its propriety.

1306. (*Mr. Headlam.*) Are you aware that in some cases in India questions put by the prisoner in cross-examination have been refused by the court upon the ground of their being irrelevant?—I have never sat upon a court-martial in India. They do not come to us; they are approved of in India.

1307. They come to the Judge Advocate-General?—They come to the Judge Advocate-General eventually, but they do not come to me.

1308. Are you aware that there have been some cases in India in which questions put by the prisoner have been refused, and the whole trial has been subsequently upset in consequence of the court refusing to put questions on behalf of the prisoner?—I was not aware of it. The general courts-martial in India go to the Military Secretary. I do not deal with them.

1309. (*Lt.-Gen. Eyre.*) With reference to the Deputy Judge Advocate deciding points, is it not the case, according to the regulations lately made for the guidance of the Judge Advocate and the court-martial, that he is directed to point out to the court anything in favour of the prisoner?—Yes, he ought to be quite as much the adviser of the prisoner in my opinion, or more so, than he would be of the prosecutor. He is supposed to advise the prisoner for his good.

1310. Do not the court when they think a question rather tends to damage the prisoner, although it is put by the prisoner himself, always advise him to withdraw that question?—Yes, and the Judge Advocate would advise him in his defence.

1311. (*Chairman.*) Before a trial takes place in a general court-martial the prisoner is entitled to know the nature of the charge and the evidence that is to be brought against him, is he not?—Yes, that is the case in all courts-martial, regimental, district, and general; he is present at the preliminary investigation of his case, therefore is aware of the evidence to be brought against him.

1312. Is it necessary that he should know the nature of the evidence of each witness that is to be brought against him?—I do not think it is. Generally speaking he does know it, but he has no summary of the evidence given him.

1313. What are the documents that are furnished to a prisoner?—He gets a copy of the charge and a list of the evidence against him. His own evidence of course he knows, and that would be naturally put down too, so that he would have the evidence for and against him.

1314. Can any witness be examined whose name has not been delivered to the prisoner previous to the commencement of the proceedings?—Yes; I think that if it was necessary to call in extra evidence you might do so and would do so.

1315. Without notice to the prisoner?—Without notice to the prisoner. If occurrences in the court-martial made the prosecutor think it was necessary to call additional evidence he would do so. The

prisoner still has the power of cross-examining that evidence the same as any other, if he chooses.

1316. He is called upon to cross-examine the evidence immediately on the evidence being given, without a knowledge of the character or the circumstances of the witness, is he not?—Yes.

1317. Have you any suggestions to make to the Commission with regard to the mode of conducting the inquiries in a court-martial, as far as the evidence for the prosecution and the defence are concerned?—I have not.

1318. With regard to the finding, it has been suggested by a previous witness that an alteration might be made in the mode in which the opinions of the officers of the court are taken, and that instead of the opinion of the junior officers being taken first, the opinions should be taken from flank to centre, do you think that would be an advisable alteration?—I think it would. The reason I suppose that the junior officer is made always to give his opinion first is that he should not be biassed by his superiors, but I think it would very likely go against the prisoner, because I think young officers in their ignorance give rather vague opinions, though not so much now as they used to do; I do not think it would make much difference. It would not be a bad plan I think for the members of the court not to give their findings *vivâ voce*, but to write them on bits of paper and hand them up to the president; but I do not think it would make much difference in the case.

1319. Do you see any objection to some of the rules that are applicable to general courts-martial being applied to district courts-martial; for instance, that there should be a Deputy Judge Advocate and a prosecutor in a district court-martial the same as in a general court-martial?—I do not think it is necessary, because they are generally plain cases. It would not be a bad plan if you had the power of doing it, but in most cases the crime is very closely investigated by the commanding officer, and witnesses are examined, and there is so much clear evidence adduced that generally speaking the cases do not require a Deputy Judge Advocate to assist the court.

1320. Who in the district court-martial has the duty of looking to the interests of the prisoner in the same way that the Deputy Judge Advocate does in a general court-martial?—Nobody particularly; officers generally look upon court-martial as a court of honour, and they would look quite as much to the interests of the prisoner I think as they would to discipline.

1321. Then of course you would not recommend it in a regimental court-martial?—No, I think it is quite unnecessary for those courts. If it is a serious crime I think the best way is to try a man by general or district court-martial.

1322. According to the Queen's Regulations we observe that no young officer can sit upon a court-martial until he has attended the courts-martial held within the district in which he is quartered for a period of six months?—Yes, he attends as supernumerary.

1323. From your experience should you say that that is sufficient to enable a young officer to exercise a proper judgment in the court?—I think it is; for his commanding officer is supposed to examine him on the Mutiny Act and the Articles of War; but I think a commanding officer, if he thought six months was not enough (some men's intellects are not so clear as others) would order him to sit longer. If I, as commanding officer of a regiment, thought a young officer was not competent to sit as a member of a court-martial, I should order him to sit longer as a supernumerary.

1324. Is it a general rule in the service that the commanding officer shall pass all young officers through an examination as to their fitness and competency to sit upon courts-martial?—I cannot say that they do so exactly, but they certainly should do so; and any president if he saw a young officer deficient would report him.

1325. Then you would not object to its being made a rule without exception that such an examination should take place?—No, I think it is a very good thing that it should. The Queen's Regulations point it out.

1326. On the average are there a sufficient number of courts-martial in six months in each of the different districts in England, for instance, to enable a young man to become competent to sit upon a court-martial?—I am sorry to say I think there are. If a man reads the Articles of War and the Mutiny Act attentively a very few courts-martial will make him competent to give his opinion as a member. Officers are not so young as they used to be; officers of 18 or 19 ought to be competent judges very soon, I think, of what is right and what is wrong.

1327. (*Lt.-Gen. Scarlett.*) Do they not undergo a more strict examination now before entering the army than they did formerly?—They do.

1328. (*Capt. Vivian.*) There is no examination at present with regard to military law, is there?—There is not; but a man has more knowledge imparted to him than he had before, and therefore I think he picks up these things more quickly, or, at any rate, he ought to do so. An officer joining the army used to know very little sometimes, but that certainly cannot be quite the case now.

1329. (*Mr. Mowbray.*) You have just stated that you think that any young officer reading the Mutiny Act and Articles of War attentively would soon be competent to discharge his duties on a court-martial?—Yes.

1330. But in an earlier part of your evidence you stated, did you not, that you thought it would be desirable to simplify the Articles of War?—The clearer they are made the better, because I think sometimes there is a little doubt about them.

1331. Do you not think that the Articles of War and the Mutiny Act in their present condition without an index are very difficult for young officers to comprehend?—I think they are.

1332. To some extent they may appear to be conflicting, may they not?—They may.

1333. And in addition to the Mutiny Act and the Articles of War military law is to be found in a variety of regulations, such as the Queen's Regulations, and the War Office Regulations, and various warrants connected with pay and promotion, and various Army Service Acts from 1847 to 1867?—Yes.

1334. In point of fact military law is at present very much scattered, is it not?—No doubt.

1335. And it requires a great deal of consolidation and codification?—Yes, I think it does for particular cases.

1336. With respect to the prosecution, you have stated that you think that all serious cases should be tried by general court-martial, what would you consider as serious cases?—I mean by serious cases intricate cases.

1337. Either intricate as to facts or serious as regards the nature of the offences?—I mean intricate as to the facts as well as serious as to offence.

1338. Do you not think that it would be very desirable that in all those cases application should be made to your office before the general court-martial was ordered, and that the charges should be prepared in your office instead of being prepared, as they are at present, in the Judge Advocate-General's office?—The Judge Advocate-General ought to be more competent, I think, than we are, to decide the legality of a charge, because if we do not think a thing is quite right we have to refer to the Judge Advocate-General.

1339. The Judge Advocate-General from his greater legal knowledge you suppose to be more competent to prepare the charge?—The charge is prepared by the commanding officer of the regiment.

1340. It is settled at the Judge Advocate-General's office, is it not?—It is settled at the Judge-Advocate General's office.

1341. Have you never considered the difficulty that arises from the Judge Advocate-General being

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

the party to settle the charge, and being therefore responsible for that charge, and being afterwards at the conclusion of the trial placed in the difficulty of having himself to revise the charge which has been prepared in his own office?—There may be something in that.

1342. Must it not prevent his approaching the consideration upon the charge with as impartial a mind as he otherwise would have done?—That may be so in some cases.

1343. Do you not think that if legal assistance were given to the Adjutant-General; for instance, if some legal official in the nature of a clerk of indictments were attached to the Adjutant-General's office for the express purpose of preparing the charges that would be a very desirable thing with reference to all general courts-martial?—I think it would.

1344. And with such legal assistance the Adjutant-General, being a soldier, could discharge his duty and get up the case for the prosecution?—Yes; but I am all for having things very plain; and the only thing is that you introduce a law officer into the Adjutant-General's department, where we do not stick so much to law as to equity and honour.

1345. You say that you are all for having things very plain; but are there not a number of cases, and is not that number increasing more and more every year, which are anything but plain, such as embezzlement cases involving matters of account?—Those sort of cases there are, certainly.

1346. Are they not the most difficult cases that are tried by courts-martial?—They are. I should be almost inclined to hand those cases over to civil law.

1347. You think they might be handed over to the civil tribunals with advantage?—I think so, certainly. I would rather see them so handed over, because I think some of them are almost beyond the competency of officers to decide.

1348. Are you aware that at present those cases occasion the greatest embarrassment to the Judge Advocate-General?—Of course they must.

1349. Because he is constantly in the habit of finding inadequate proof, and he is obliged to recommend that the stoppages in the sentence should be set aside?—I should think that is very naturally the case.

1350. With regard to getting up the case for the prosecution, have you often seen instances of a witness for the prosecution being also employed to act as prosecutor?—I have heard the prosecutor after he has made his address give his evidence. If he gives his evidence at all, he gives it after his address.

1351. Does it not occasionally and not unfrequently occur that a person appears as prosecutor who first opens the case by an address, and then is examined upon oath and cross-examined as a witness, and subsequently at the end of the case has to reply on behalf of the prosecution?—Yes, I have seen that; I thought you meant that his evidence was brought in at the middle of the trial. I have never seen that; but I have seen the prosecutor give evidence immediately after his address, but not very often. It is rather a rare occurrence.

1352. Have you never seen this inconvenient result, that the individual who has appeared both as prosecutor and as witness in his reply at the close of the case, has made statements, not upon oath, which may have been supplementary to his statements upon oath, and which may have thereby tended to confuse the court from their not knowing how to discriminate between his statements given upon oath and his statements given in his address as prosecutor?—I think that if he did so they would of course trust to the statement given upon oath.

1353. Would you not think it desirable that there should be a law prohibiting in any case a witness from appearing as prosecutor?—I think it would be better.

1354. You say that you are not acquainted with Indian courts-martial?—No, I never even see them. I merely see the finding and the sentence of general courts-martial in India.

1355. You do not know a case in India which has afforded a striking illustration of the inconvenience arising from a witness appearing also as prosecutor?—No.

1356. You say that you think that no one ought to address the court for the defence; will you give any reasons why the prisoner should not have the same advantage of having his case put before the court by an educated man reading an address, with the force and effect which may be expected to follow from its delivery by an educated man, when the prosecutor has the advantage of having the case stated by an officer who conducts the prosecution, both in his opening address and in his reply?—You must know that soldiers are not lawyers, and if you allowed every soldier, who is perhaps a man of bad character, to inproduce a lawyer, the sort of lawyer which the soldier would introduce would rather prejudice the court against the prisoner than do him good. I would not so much object to a friend addressing the court, but I am quite against introducing civil law into military law, and against introducing lawyers at courts-martial. I presume that these questions refer to the case of a private soldier under trial.

1357. (*Capt. Vivian.*) But law officers are admitted in general courts-martial, are they not?—I know they are, but I think the less they address the court, or interfere with the court, the better.

1358. But they are admitted to general courts-martial now to assist officers; why should they not be admitted to assist soldiers?—They are admitted to assist soldiers.

1359. Only in general courts-martial?—Yes, a soldier can have a lawyer to advise him if he chooses.

1360. (*Mr. Mowbray.*) With respect to district courts-martial, at present no Deputy Judge Advocate appears at a trial by a district court-martial?—No.

1361. The general officer who has convened the court-martial confirms the proceedings without reference, ordinarily speaking, to the Judge Advocate-General, does he not?—Yes.

1362. Do you not think that it would be very advisable that the proceedings of district courts-martial should be submitted to the Deputy Judge Advocate of the district for his consideration before they are confirmed by the revising officer?—I do not think it necessary in plain cases. If I, as a general officer commanding a district, had a case upon which I thought there was any doubt I should, before I confirmed it and carried out the sentence, refer it to the Judge Advocate-General; but the generality of cases of district courts-martial are very plain, and a general officer with a certain degree of experience is, I think, competent to decide most of them; but certainly a general officer would, I think naturally, if he had the slightest doubt about a case, refer it to the Judge Advocate-General.

1363. You say that the cases are very plain, but is it not often a matter of pure accident whether a case is tried by a general court-martial or by a district court-martial?—I think it is according to the degree of the offence.

1364. Is there any rule which determines it?—Yes, there is a rule by the Articles of War. There are certain crimes which you can try only by general courts-martial, unless you can get competent authority to try them by a lesser tribunal. Often a colonel of a regiment applies for a general court-martial upon a man because he has committed a certain crime, but he writes a letter stating his opinion that a district court-martial would meet the ends of justice.

1365. As a matter of fact, whether a crime be or be not more serious, cases involving great difficulty, both as to law and as to facts, come before district courts-martial?—They do very often; and sometimes as difficult cases come to district courts-martial as to general courts-martial.

1366. Then would it not be advisable that in those difficult cases the general should have the benefit of the advice of the Deputy Judge Advocate before he confirms the proceedings?—I think so; when it is

difficult, certainly; but I think in any case of great difficulty the general would refer the matter to the Judge Advocate-General. Of course it might go to the Deputy Judge-Advocate, but I think in all common cases it would only cause delay, and keep the man longer in the guard room, which is not at all an agreeable place for a soldier to be in when there is no necessity for it.

1367. Are you aware that at present every district court-martial, after it has been confirmed, is in fact read by the Deputy Judge Advocate; and in case of difficulty is brought under the notice of the Judge Advocate-General?—Certainly.

1368. Does it not frequently occur that the Judge Advocate-General is obliged to interfere and set aside the proceedings of the trial after they have been confirmed by the General commanding the district?—There are cases of that kind.

1369. And any injustice of that kind would be obviated, would it not, if the case were brought before the Deputy Judge Advocate, and by him submitted, in case of difficulty, to the Judge Advocate-General before confirmation by the officer commanding the district?—I think so, in certain cases; but some cases are so plain that it would be really only productive of delay, and I think that it rather tends to lower the position of the general officer, and takes away his power, as if he were an incompetent judge. I never had a case of a court-martial being quashed.

1370. Do you think that the powers of the general officer would be affected by the proceedings being submitted to the Deputy Judge Advocate before confirmation?—It has long been in the power of a general officer to approve and confirm the finding and sentence of a court-martial; and he is very wrong, if he sees a doubtful case, if he does not refer it to the proper authority.

1371. Your objection is rather to lengthening the time which it would take before it could be approved and confirmed?—It is.

1372. That objection might be met by Colonel Laye's suggestion, that the staff of Deputy Judge Advocates should be increased, so that there might be an adequate number to discharge those duties within a reasonable time?—Yes, I do not think it is very material.

1373. If there were no objection in point of time it would be a great assistance to the General commanding the district, would it not, to have his attention called to the points of the case by a gentleman supposed to be specially conversant with military law?—Of course; I think there would be no objection to it.

1374. (*Capt. Vivian.*) The confirming officer, that is to say, the general officer of the district with regard to a district court-martial, has very great power, has he not?—Yes.

1375. That is to say, he can confirm a sentence, or he can remit the whole of the punishment?—That is so.

1376. So that, in fact, a court-martial at present is only a court of report, it hears the evidence, finds the prisoner "guilty" or "not guilty," and it passes the sentence; but having passed the sentence the sentence cannot be carried into effect until it is confirmed by the commanding officer?—That is the case.

1377. With regard to general courts-martial, all general courts-martial come to the Horse Guards, do they not?—Yes.

1378. The district courts-martial go to the general officer of the district for confirmation?—Yes, for confirmation.

1379. And regimental courts-martial go to the commanding officer of the regiment to be confirmed?—Yes.

1380. All those courts are, as you have said, composed of officers of experience?—Yes.

1381. And an officer is not put upon a court-martial before it is supposed that he knows sufficient of martial law to settle a question upon its merits?—That is so.

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

1382. With regard to naval courts-martial, the practice in the navy is, that directly a prisoner is found "guilty" and the sentence is passed, the sentence is then and there announced, the court having complete power to announce the sentence at once; do you know any grave objection why that practice should not prevail in the army as well as in the navy?—I think it would be better in some cases for the commanding officer to think over the case before he approves and confirms.

1383. For instance, with regard to regimental courts-martial, supposing a commanding officer calls a regimental court-martial for the purpose of trying a non-commissioned officer who has been guilty of some offence, and the court-martial sentences that non-commissioned officer to be reduced, supposing that he is a pay-serjeant, let us say, to be reduced to the rank of a serjeant or a corporal; have they that power?—The colonel of the regiment can reduce him to a private, but cannot reduce him to a corporal.

1384. But whatever the sentence may be, the commanding officer has the power now of calling that court together again, for the purpose of reconsidering their sentence?—Yes.

1385. And he may desire the court to reconsider their sentence for the purpose of passing a more severe sentence?—Yes.

1386. Do you not think that that is a very great power?—Yes; he cannot order them, but he may point out that he thinks the punishment is too lenient for the crime.

1387. So that with regard to a regimental court-martial composed of three officers of a regiment, a captain and two subalterns, probably those three officers having passed a sentence are called together again by the commanding officer and desired to reconsider their sentence?—Yes, he has the power of doing it, certainly.

1388. In the case of a district court-martial the general officer of the district can also re-assemble the court-martial, can he not?—Yes.

1389. Or he can absolutely and entirely remit the sentence of the court-martial, not having heard the evidence, though we will infer, as a matter of course, that he has read it?—Yes.

1390. And the Commander-in-Chief has the power entirely to remit the sentence of a general court-martial?—The Queen has, the Commander-in-Chief has not.

1391. Or, on the other hand, he may not listen to the recommendation of the court to mercy or to leniency; but he may carry the sentence, which was the necessary sentence of the court, into full and entire effect?—He can, of course.

1392. Do you not think that that is a very great power to place in the hands of any one man?—It is; but I think that a commanding officer ought to have power.

1393. I am not talking of the commanding officer of a regiment, but let us take the case of a general officer in a very high position. I do not believe that there is a man in the service who would do it; but supposing there was a man actuated by very angry or violent feelings towards a prisoner, might he not under these powers persecute him very severely?—A commanding officer might do so where a general officer would not, because those officers are not brought much into contact with the soldiers of a regiment.

1394. On the other hand, might he not favour a man very much and let him off altogether if he was a great friend of his?—Yes; but I think we have not any commanding officers like that.

1395. Why should there be that great difference which I have described between military courts-martial and naval courts-martial?—I do not know why there should be; but who approves of the naval court-martial?

1396. The court itself having passed its sentence, the sentence is at once announced, and if the man is acquitted, he is then and there released, or if the man is punished, he then and there knows what his punish-

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

ment is?—I should not like to recommend that such powers should be taken out of the commanding officer's hands. I do not think that they are abused.

1397. Under the present system have you ever heard of a case of a regimental court-martial where the sentence is not confirmed, but the man, pending the discussion on this point, and reference probably to a higher authority, is nevertheless kept in confinement for nine or ten days?—Certainly.

1398. Notwithstanding that the man has not been sentenced to any punishment by the court?—The man is always under confinement until the finding of the court is approved and confirmed, in the same way as a non-commissioned officer is under arrest.

1399. There is scarcely any practical limit to the time it may take to confirm a regimental court-martial; a man, notwithstanding he is not sentenced to any punishment by the court, may, under the present system, be imprisoned for nine or ten days, may he not?—It is possible.

1400. Do you know no reason except that you would not like to take the power away from the commanding officer, why military courts-martial should not be the same as naval courts-martial in regard to having the power of announcing their sentence at once?—I should not like to see the present system altered. In my opinion it has worked very well as it is, and I should not like the] power taken out of the commanding officer's hands.

1401. (*Mr. Headlam.*) With respect to general courts-martial, the power of confirming or revising the sentence is not vested in the commanding officer nor in the Horse Guards, but I think in Her Majesty herself?—Yes.

1402. And that power is exercised upon the advice of the Judge Advocate-General for the time being, is it not?—Yes.

1403. Supposing that the court had the power of deciding absolutely, and sentences were announced at once, that power of revising would be taken out of Her Majesty's hands, would it not?—Yes.

1404. And whatever had been the mistakes or hardships upon the prisoner in the conduct of that trial, there would be nobody who would be responsible for revising or cancelling the sentence?—No, except the Judge Advocate-General.

1405. What would be the functions of the Judge Advocate-General, supposing that the court had the power of absolutely deciding?—The general court-martial goes to him.

1406. But supposing that the practice were the same as it is in the navy, viz., that the court had the full power of deciding at once by itself upon the punishment, and of announcing it to the prisoner, and if that sentence were carried immediately into effect, of course under those circumstances there would be no power of revision?—No.

1407. So that the functions of the Judge Advocate-General would be entirely done away with?—Quite so.

1408. In point of fact there is no Judge Advocate-General in a marine court-martial, is there?—I think that there is one in the court. I never heard of a naval court-martial without a Judge Advocate-General. Naval courts-martial are not so frequent as military courts-martial. In the first place, a captain in the navy has the power of giving 48 lashes himself, which is as much as a regimental court-martial can give; and they do not try men in the way that we do, but they summarily punish them. That is why I should not like to see courts-martial altered. Of course I would not object in the case of general courts-martial, but I should not like the power in the case of a common regimental court-martial to be taken out of the commanding officer's hands. I think it would lessen his dignity in a regiment.

1409. Do you think that it would be a desirable thing with regard to military courts-martial that there should be no power to revise the sentence after it has been announced by the court?—I think there ought to be power to revise, even if the court should adhere to their former finding.

1410. With respect to general courts-martial, you do not see any objection to that power of revision being vested in the highest power in the realm, even Her Majesty herself?—No.

1411. Do you not think that it is rather agreeable to the army that it should be so vested in Her Majesty rather than in any inferior authority?—Yes. The only evil that I know in the system is that it creates some delay.

1412. Of course in the interval between the completion of the trial and the announcement of its confirmation the prisoner is kept in confinement, is he not?—He is.

1413. Supposing that a part of his sentence is imprisonment for a certain period, does the period for which he is kept in confinement after his trial count in his sentence?—It is counted from the date when the trial is signed.

1414. So that the prisoner does not suffer an injury from the delay which intervenes between the time of the trial and the confirmation of the sentence?—No, except that he is excessively uncomfortable, and is put in a place where the drunken soldiers are put every night. In my opinion he would be much more comfortable in gaol.

1415. (*Capt. Vivian.*) But supposing he is acquitted, what then?—Then he has suffered too much.

1416. (*Mr. Headlam.*) But there is no other evil to the prisoner than the fact that you think that the gaol would be more comfortable place of the two?—Yes; but I think I might say that in case of the acquittal of a man, he has undergone perhaps two months, or even more, of disagreeable confinement, which is rather unjust.

1417. (*Mr. Mowbray.*) With respect to acquittals, are you not aware that since October 1866 an acquittal has been sent to Her Majesty within 24 hours after it has been received at the Judge Advocate-General's Office?—I was not aware of that, but of course it does not go through me. I thought all general courts-martial were taken together.

1418. And at the same time that a communication is made in writing to Her Majesty, a communication is also made to the Commander-in-Chief, so that in case of acquittal there is no delay?—I have very little to do with general courts-martial; in consequence of those courts-martial going to the Queen, they go to the Military Secretary, on account of the communication with Her Majesty, I only know as having commanded a district that I never saw a man actually acquitted at a general court-martial. Acquittals are rare, I think.

1419. (*Mr. Headlam.*) Can you state what delay takes place after the cases are reported from the Judge Advocate-General's Office to the Commander-in-Chief before the promulgation of the sentence in general courts-martial?—That I cannot tell you; that is in the Military Secretary's Office. They would very soon pass out if they were in my office, because I know the inconvenience and disadvantage of keeping that class of men in the guard room, and I should lose no time in forwarding the promulgation.

1420. Assuming it to be true that there is no delay in the case of an acquittal, the only evil of delay as I understand is that the prisoner is rather more uncomfortable in the mode in which he is confined than he would be if he were confined in a gaol?—I think much more so.

1421. But there is no other evil?—If there is no no delay in the case of an acquittal the man comes out and does not suffer.

1422. But assuming that in cases of acquittal there is no delay, then the evil in the other cases is simply that the prisoner is a little more uncomfortable in the place where he is confined than he would be in gaol?—There are other evils; he communicates bad ideas if he is a bad character (which is most probable) to the other prisoners that come into the guard room; he is associated with the whole regiment one after

another as they relieve guard, and he is very likely to endeavour to breed mischief. If he is a popular man among his comrades, he gives bad advice, which may be taken, and if he is an unpopular one, he does not lead a very pleasant life.

1423. Are the guards necessarily in communication with the prisoner?—They are in the day time. You cannot put a man in solitary confinement unless he has been sentenced by court-martial, and you may not put him into a military prison although you have one close by.

1424. Would it be an improvement if he could be confined in a military prison?—Certainly.

1425. Would there be any difficulty in that?—Not the slightest; he would not be put to hard labour, but he would be well kept, and under safe custody.

1426. (*Lt.-Gen. Scarlett.*) He would not suffer more than a civilian does who is remanded?—Not a bit; he would take his exercise in the yard of the prison, and he might be kept distinct from the other prisoners.

1427. (*Mr. Headlam.*) But if his confinement during that period counts as part of his sentence there would not be any hardship in his being committed to hard labour?—No, provided he is not acquitted.

1428. (*Capt. Vivian.*) But the difference between a civilian who is remanded and a military prisoner who is kept after his trial is over is that in the one case the trial is still proceeding, while in the other case, the soldier's trial is over, and he is subject, by the present system, even if acquitted, to a certain number of days' confinement, whereas the civilian instantly walks out of the dock a free man?—That is so.

1429. (*Chairman.*) Have you any suggestion to make to the Commission with regard to an alteration of military punishment?—I should like to see fines established for drunkenness, instead of always bringing men to court-martial for habitual drunkenness.

1430. But a soldier cannot be tried by court-martial for a single case of drunkenness, can he?—Not for a single case of drunkenness, but for habitual drunkenness.

1431. You think that it would be advantageous to establish a system of fines?—I think so. His Royal Highness ordered a committee to sit at the Horse Guards, composed of General Lindsay, Colonel Egerton, and Colonel Whitmore, to take habitual drunkenness into consideration. The proceedings of that committee were forwarded to the War Office, and the Duke of Cambridge recommended Sir John Pakington to let them come before this Commission. They recommended the imposition of fines instead of trying men for habitual drunkenness, and that might be done by a court if you choose, instead of leaving it to the commanding officer to impose the fine, but I think the moment a man after he has been imprisoned comes out, he generally gets drunk again.

1432. Did the committee to which you have just alluded consider a scale of fines?—Yes; that committee was composed of three good officers; General Lindsay is an officer of experience, and Colonel Egerton and Colonel Whitmore have both commanded regiments.

1433. Has your Lordship taken into your consideration the question whether the application of fines imposed for drunkenness should be as at present, or whether they might be applied to some institution in the regiment; for instance, for the benefit of the soldiers generally?—Whether the War Office would sanction it or not, I do not know; but at present of course the stoppages for habitual drunkenness are credited to the public; it is a War Office question whether the Secretary of State for War would allow that money to be applied for that purpose.

1434. (*Lt.-Gen. Scarlett.*) Do you think it would be useful if they were to allow it?—I think it would be.

1435. (*Chairman.*) Do you think that in a regiment, for instance, it would tend to the diminution of drunkenness if the soldiers themselves knew that the punishment was a fine, and that that fine was to go to something in the benefit of which all the soldiers of the regiment would participate?—I do not think it would stop drunkenness; they would say, "Oh! "here is Jack So-and-so. He is a good fellow. We "are always enjoying ourselves at his expense;" and I think that would rather encourage the drunkenness.

1436. (*Lt.-Gen. Scarlett.*) Do you not think the man who was fined would feel it much more when he saw other people enjoying the results of his bad conduct?—He might.

1437. (*Lt.-Gen. Eyre.*) Are you aware that the power of a naval captain to mulct offenders of their pay for almost all offences is almost unlimited?—I know they do do it, but I do not know the extent of their powers. I think it would be a very good plan to try, but of course it rests with the Secretary of State for War whether he chooses to authorize it, because I expect it would amount to a large sum.

1438. (*Capt. Vivian.*) But a drunkard is generally under stoppages almost as much as he can be, is he not?—There is an increase of pay now, and instead of trying a man by court-martial I should fine him 1*s.* or 1*s.* 6*d.* for the first offence in a lump.

1439. (*Chairman.*) In a regimental court-martial, at the present moment, you cannot fine a man for drunkenness?—You can put a man under stoppages of 1*d.* a day if he is tried for habitual drunkenness.

1440. But for a simple act of drunkenness you cannot fine a man, can you?—No; unless he is drunk on duty or on the line of march, and then you can stop 1*d.* a day for two months.

1441. Do you think it would be advantageous to make the punishment for simple drunkenness in regiments a stoppage of pay?—I think I would fine a man. It is better than putting men into the cells. That does them no good. In the first place if a man is drunk the commanding officer may put him in the cells, and then his pay is stopped and his service is lost for the seven days.

1442. From your experience what should you say is the usual punishment in a regiment for simple drunkenness?—It depends a great deal upon the man. Sometimes a man who is a good soldier and a smart soldier and a credit to his regiment gets drunk, who, when he is not drunk, does his duty well; and then you will have a dirty slovenly fellow who is always bringing discredit on his regiment and skulking from his duty, so that of course you are rather more inclined to deal with him more heavily than you would with the good man. Some of the smartest soldiers are drunkards, and generally speaking if you have anything where danger is concerned, such as a fire, they are generally active and daring. I have always seen that when they have been called out at fires the drunkard is the fellow you will see in the most dangerous part of the flames.

1443. Your Lordship has been in the Crimea; did you think that was the case during the war in the Crimea?—They do not get drunk abroad in the same way that they do at home.

1444. (*Lt.-Gen. Eyre.*) Do you mean that the drunkard is pot valiant?—I do not mean that he is pot valiant, but your bad character comes often well out when there is anything dashing to do. I do not dislike a scamp myself, if you have power to keep him in order. He is generally a smart soldier, but he requires a certain degree of tight handling.

1445. (*Chairman.*) Your Lordship would recommend an increase in the system of fines?—Yes, I would, and I would have less imprisonment.

1446. Where the system of fines applies would you recommend an increase of the amount of the fines?—Yes, so that it does not affect the officer commanding the company. That is what a commanding officer should look to. For instance, a commanding officer has power, if a man is absent for five days, to stop 5*s.* from him; but then sometimes a man is in debt to his captain, and then I should not stop the man's pay, because the captain suffers if the man is heavily

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

in debt, and it is really punishing the captain instead of the man.

1447. (*Lt.-Gen. Eyre.*) I presume the fines which you propose, you consider would be the means of limiting a man's power of continuing to be a drunkard, while his duty would not be thrown upon others by his being put in prison?—Yes. I do not think long imprisonments do good. I would rather have short imprisonments, and make them very severe.

1448. (*Lt.-Gen. Scarlett.*) Could you suggest anything to be added to the punishment of imprisonment of shorter duration that would make it more effectual?—No, unless you have your prison discipline stricter.

1449. They have now the punishment of piling shot, and that seems to be the most severe; but is there any mode by which a more severe punishment could be inflicted during a shorter imprisonment than is the case now?—Solitary imprisonment is a greater punishment, but it depends very much on the constitution of a man. Some men cannot stand solitary confinement, while other men will lie and sleep, and do not care a bit about it.

1450. (*Mr. Headlam.*) Would you abolish altogether the crime of habitual drunkenness, and merely punish every man for every occasion that he was drunk, but not have any greater punishment for his being drunk twice within a given time?—You increase the punishment in proportion to the number of offences. I do not think it would signify much if habitual drunkenness were abolished altogether, but you must punish drunkenness.

1451. (*Chairman.*) At the same time a commanding officer cannot award the same punishment that a court-martial can?—No; but then, of course, if a soldier was constantly drunk you should have the power to bring him to a court-martial for an act of drunkenness.

1452. (*Lt.-Gen. Scarlett.*) Would you increase the power of a commanding officer in punishing for drunkenness without a court-martial?—Yes, I would. It would save the courts-martial.

1453. (*Chairman.*) From your experience is drunkenness in the army on the increase or the decrease?—I think it is on the decrease. In the last year or two drunkards have been rather severely dealt with. I had found that habitual drunkenness was so inconsistently dealt with throughout the army that I recommended His Royal Highness to insist that every man should be tried as an habitual drunkard for being four times drunk. Sometimes there would be a regiment in garrison where men were allowed to get drunk a great many times without being tried, while another regiment acted up to the strict letter of the law and tried their men for the fourth offence.

1454. (*Lt.-Gen. Scarlett.*) But that would be only an apparent difference, the real amount of drunkenness would be the same, would it not?—I suppose it would: but I do not think there is so much drunkenness in the army. Some years ago you would have men drunk on parade frequently, and if you had an afternoon parade you would certainly have a man or two drunk. Now you very seldom see a man drunk on duty. There is drunkenness at night sometimes, but I think that may be checked a good deal.

1455. (*Chairman*). Does your Lordship find that the amount of drunkenness varies in different regiments?—I do not know that it varies now so much in regiments as it does in localities. Edinburgh, for instance, is a terribly drunken place.

1456. Can you give any reason why one place should have more drunkenness than another?—I think liquor, spirits for instance, are cheaper in some places than in others.

1457. (*Lt.-Gen. Scarlett.*) Do you think that the pains that have been taken in amusing soldiers, giving them reading rooms and other advantages of that kind, have diminished drunkenness?—I should think it ought to have that effect.

1458. (*Chairman.*) But do you know that from your own experience?—I do not know that from experience. A commanding officer of a regiment, I dare say, would be able to give the Commission that information.

1459. Are you satisfied with the powers of courts-martial now to award punishment in cases of insubordination?—I am not.

1460. What alteration would you suggest?—I would suggest that the court should have power to inflict corporal punishment for insubordination, and that it should not be necessary to be coupled with violence. I have known one or two cases lately of men tried by court-martial for insubordination. I can mention a case at Chatham, where the man was sentenced to be discharged with ignominy and to be marked "B C;" and when his court-martial was read he used abusive language to the commanding officer and the whole of the battalion. He got his sentence, and he then ought to have been drummed out. I have been obliged to recommend to His Royal Highness to do away with the custom of drumming a man out, because it gives him an opportunity of being insubordinate, as far as his tongue went, as he knew they could not tie him up and give him a good flogging, having committed no violence.

1461. Is it your opinion then that it is not expedient to do away with corporal punishment?—I do not think it is. I have a great dislike to corporal punishment, but I think you ought to retain the power, and it never should be adopted but in extreme cases.

1462. (*Capt. Vivian.*) Do you know how many cases there were last year of men being flogged in the army?—I think there were 17 cases in the army and two in the Marines, as well as I can recollect. I could mention two cases that happened to me at Portsmouth, where I ordered a drum-head court-martial and flogged a man upon the spot. One man was an artilleryman; he was tried by court-martial for some serious crime (I forget exactly the crime), and he was sentenced to imprisonment and had to march from Portsmouth to Gosport to the military prison. When the escort went to march him off to the prison he kicked his boots off and said, "he would be damned if he would "march." The commanding officer came to me and asked what he had better do, and I said, "Order a "regimental court-martial to sit in front of the guard "room, and I have no doubt the court will sentence "him to be flogged." It was carried out at once, and he was flogged in half an hour. I saw that man afterwards in the hospital, and asked him how he could be such a fool as to act as he had done, and whether he thought I could possibly give in to him, and he said, "No; I don't know what could make me such a fool; "I am very sorry for it, and I will never do it again." He marched off to prison very well after that when his back was well. Some soldiers are very cunning; they try you on to see what you will do. You must bear in mind that if men are physically fit they are taken into the service without regard to character. A man may be a ticket-of-leave man, although most men I would trust to any extent, of course.

1463. (*Chairman.*) Putting aside corporal punishment, what is the highest amount of punishment, short of death, that you can inflict for insubordination?—Penal servitude.

1464. For how long?—For five years.

1465. Is it your Lordship's opinion that that punishment would not be sufficient to deter insubordination?—I do not think it would, because there are certain men that dislike the service; and I am confident in my own mind that when I commanded at Portsmouth there were crimes of insubordination committed for the purpose of getting penal servitude; but instead of meeting their views in that way I always tried them by district court-martial instead of general court-martial, and where there was any act of violence the court generally used to flog them. I carried out that system, and it soon stopped it, but I am convinced their idea was to get penal servitude and a ticket-of-leave. That ran through the army. I was told so by non-commissioned officers. I have known men commit acts of insubordination and violence without any provocation, and when they did not even know the officers

upon whom they committed them. For instance, I remember a visitor of a military prison, an officer of another regiment, was merely going to ask the men if they had any complaints, upon which the prisoner threw a pot of blacking at his head. He could have had no animosity against him, but he wished to get out of the service.

1466. Is there a power generally in various districts of England to inflict the punishment of solitary confinement upon soldiers?—Not in all districts.

1467. Are there districts where there is almost no power to inflict that punishment?—They could not do so at Aldershot, for there are no cells for that purpose. At Gosport they can inflict it, and I expect there are other districts where they cannot inflict that punishment.

1468. In the event of corporal punishment being entirely done away with in the army, are you of opinion that the crime of insubordination will increase?—There is really very little insubordination in the army in my opinion. It is only when you get an incorrigible fellow, that you have insubordination. In some regiments you never scarcely hear of a case of insubordination.

1469. (*Lt.-Gen. Eyre.*) Do you think that really bad characters in the army are very numerous, or not?—I do not think they are numerous.

1470. Do you not think they are much fewer than is generally supposed?—Certainly.

1471. (*Maj.-Gen. Horsford.*) Do you think that flogging has the effect of checking insubordination?—I think a man will be very careful how he is insubordinate when he knows that he is likely to get it.

1472. Then if that fear if being flogged is taken away, do you think that insubordination might increase?—I do; I think it must have a deterrent effect, more or less.

1473. (*Capt. Vivian.*) Do you think if flogging was done away with it would be a good thing to strengthen the hands of commanding officers as to getting rid of bad characters?—Yes, only it must be very cautiously done. They can get rid of bad characters now.

1474. But they can only get rid of them after they have been tried by court-martial and marked "B C"?—If there is some mark the doctor says that cannot be obliterated the Commander-in-Chief authorizes the man's being dismissed. For instance, if a man has a "D" on him, and turns out afterwards to be a bad character, or his age prevents his being re-enlisted, his discharge is authorized.

1475. But without that, supposing a commanding officer has an insubordinate fellow in the regiment that he can do nothing with, can he now dismiss him unless he is tried by court-martial and marked "B C"?—No, and I would not authorize his discharge unless he was marked in some way, because he would re-enlist in another regiment.

1476. The Marines do not mark their men "B C," do they?—They do not. I have complained to the Admiralty about it.

1477. And it occasionally happens, does it not, that a marine enlists in the army and is found out to be a very bad character?—Yes.

1478. Then his commanding officer cannot dismiss him without his being marked "B C"?—No, he must commit disgraceful conduct to have that done.

1479. I believe in the household troops they can dismiss a man?—They can dismiss him in the household cavalry, but that man can go away and enlist in a dragoon regiment, or any other regiment, if he likes.

1480. Do you not think it would be advisable to strengthen the hands of commanding officers if flogging were done away with as to getting rid of bad characters?—I think it would.

1481. So that the public may have some protection against a man being able to enlist again in another another regiment?—Yes, but it must be done very cautiously, because you are giving to a bad man for nothing what you do not give to a good man without paying 20*l.* I mean to say you must give a man a very good trial before you can get rid of him, because if a man wants to quit the service he will say, "I will go and commit a crime, "and just have a little mark put upon me which "nobody will know anything about when I have "put on my coat and waistcoat, and away I will go."

1482. But then he would be tried by court-martial, would he not?—Yes, but he would not mind that.

1483. (*Mr. Headlam.*) In a considerable number of cases I believe now the district courts-martial recommend that a man should be dismissed with ignominy?—Yes.

1484. Can you tell me in what proportion of the cases where such a recommendation is made the recommendation is carried into effect?—I believe always.

1485. It has been stated to me that in many cases where courts-martial have recommended dismissal with ignominy it is not carried into effect?—I have not known that to be the case.

1486. Do you believe it is always carried into effect?—I believe so.

1487. (*Mr. Mowbray.*) The present practice is to sentence a man to it?—Yes; recommendation was the old practice.

1488. The sentence of the court is absolute, that the man be discharged?—I always understood it so when I was in command. A commanding officer in my opinion has power to remit imprisonment. I do not think a commanding officer can remit a stoppage to make good deficiencies.

1489. (*Chairman.*) Have you any suggestions to make with regard to the crime of disgraceful conduct, or the punishment of it?—I think stealing from a comrade is one of the worst petty kinds of disgraceful conduct we have. When I first joined the army there used to be such a thing as a company court-martial, particularly for that crime, but it is not allowed now. I believe it was forbidden in consequence of the men being more severely treated and handled by a company court-martial than they were by a regimental court-martial of their officers.

1490. How is a company court-martial constituted?—The captain used to order the court-martial to sit, and the colour serjeant used to sit as president, with two serjeants, two corporals, and two privates. I suppose it differed in different regiments; but it used to be so in my regiment. The man was sentenced to run the gauntlet, and the men used to take the slings and lick him as he ran up and down.

1491. But that system was abolished because it was found that the sentences were too severe?—The sentences were too severe; they used to lick the men tremendously.

1492. (*Lt.-Gen. Scarlett.*) Was that a legal court-martial, or was it a custom?—It was a custom. It was approved by the captain. The proceedings were written out just like an ordinary court-martial. It was brought before the captain, who read the court-martial and the finding and confirmed it.

1493. Was that recognized by the higher authorities?—It was winked at, at any rate.

1494. (*Chairman.*) Was it carried out to any great extent?—Not much.

1495. Do you recollect the circumstances under which it was stopped at the time?—I forget exactly the period.

1496. Was it by an order from the higher authorities?—I think it was by an order from the higher authorities.

1497. Was any reason assigned for its being stopped?—I believe it was supposed that it was because the men were more severely punished. If the culprit was unpopular they would punish him most severely.

1498. Your Lordship of course is aware what constitutes disgraceful conduct in the Articles of War?—Yes.

1499. Would you alter in any way those items?—No, I do not think I would. It is a very serious thing for a man to be tried for disgraceful conduct, because it affects him in many ways; not only as regards immo-

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

diate punishment, but as regards his service and his pension. He may be tried for a petty theft without its being designated as disgraceful conduct, and it has been recommended that unless it really is a serious matter a man should not be charged with disgraceful conduct, although the crime would come under the definition of disgraceful conduct.

1500. Do you think that the number of items in the Articles of War which subject a soldier to trial for disgraceful conduct tends to diminish the feeling against disgraceful conduct among the soldiers of a regiment?—I think it does.

1501. Does your Lordship think that if disgraceful conduct were made a more serious crime it would tend to the diminution of really disgraceful conduct in the army?—Yes; if a man is tried for disgraceful conduct it is a severe charge.

1502. Some of the witnesses have given it as their opinion that some of the Articles should be taken out of the charge for disgraceful conduct, as being of frequent occurrence and not very serious; is your Lordship of that opinion?—Yes; but there is a letter which enables the commanding officer to take the crime out of the category of disgraceful conduct, and according to which a man is not to be charged with disgraceful conduct unless the thing is to a certain degree serious.

1503. But would it not be better that every soldier should have in his mind what is and what is not disgraceful conduct?—Yes. I think stealing from a comrade, even if it is a small sum, should be charged as disgraceful conduct, because a soldier has no way of locking up his things.

1504. But ought not the distinction to be this, that the disgrace is in stealing from a comrade under any circumstances, and not in the amount stolen?—The amount of course makes it more serious.

1505. But it does not at all make the crime different?—It does not.

1506. Would it not be better that the crime of disgraceful conduct should be so strictly defined that every soldier should know, and should have a natural disinclination to it and horror of it?—Yes. I think a soldier is a queer fellow; he does not study martial law much, and it is left really to the discretion of a commanding officer whether he chooses to charge the man with disgraceful conduct or not, according to the degree of the offence. I do not think it requires any further classification. A commanding officer at the head of a regiment ought to be the proper judge whether a man should be charged with disgraceful conduct or not.

1507. (*Lt.-Gen. Eyre.*) When I had more to do with soldiers than I have at this moment it was the rule, by an order or suggestion from your department, that a man should not be tried for disgraceful conduct for the first offence; but that it was only in the event of his committing a disgraceful act a second time that those words should be used?—Yes; but I apprehend that if a man commits a disgraceful act it does not require a charge of repeated acts.

1508. (*Chairman.*) With regard to desertion, have you any suggestions to make to the Commission?—I do not think that desertions are so frequent as they used to be.

1509. To what do you attribute that?—To the greater difficulty in obtaining employment in civil; the increased comforts in the life of a soldier; and the bounty being small, so that they are not so much inclined to desert with a view to enlisting elsewhere.

1510. But for desertion it is absolutely necessary that they should be tried by court-martial, is it not?—A young fellow sometimes deserts and he will repent it and come back and give himself up, and you are obliged to try him by court-martial; it is not optional.

1511. Would you recommend that in all cases where a deserter gives himself up the commanding officer should have the power of awarding what punishment he thinks fit?—I think so in some cases.

1512. That it should be no longer necessary in case a deserter gives himself up that he should be tried by court-martial?—I think it might be so. There are cases sometimes where a man goes and enlists in another regiment; this man should not escape trial.

1513. Do you think it would tend to bring back a number of deserters if that alteration were made?—I do not know that it would.

1514. Do you think that many deserters would come back if they knew that they were not to be tried by court-martial?—I think a great many men might come back from the States.

1515. But they would be subject to whatever punishment the commanding officer thought fit?—If they thought that they would be pardoned they would come back. I do not think that men would come back from this country, but they would come back from abroad. They dare not come back now for fear of apprehension.

1516. (*Lt.-Gen. Scarlett.*) Those men would not be eligible men to serve again in all probability?—They would not; I have known cases where such men have tried to treat with me; but I have said that I would not treat with deserters. I have said, "Give "yourselves up, and I will talk to you," but they would not do that.

1517. If the punishment was lessened do you think that it would make much difference in desertion?—I do not think so. Sometimes a woman takes a fellow away, sometimes drunkenness takes him away, sometimes selling necessaries takes him away.

1518. (*Mr. Headlam.*) Would it not have a bad effect in a regiment if a man had once deserted, and then having deserted had been pardoned, or had been given some very small punishment?—Of course you would not pardon a man unless for some good reason.

1519. Would it not rather have the effect of diminishing the idea of the importance of desertion as a crime?—I should not like to see it much done away with, except in particular cases.

1520. (*Capt. Vivian.*) Is it not the case that very often a young soldier has got out and is led away by a woman, and gets drunk, and then is afraid to come back, and deserts simply through fear?—Yes, no doubt.

1521. Now by law you must try that man, must you not?—Yes.

1522. And you think that there might be some discretionary power?—I think that there might be some discretionary power. Sometimes the commanding officer would like to let a young man off, particularly if the man came back of his own accord. Of course if he was apprehended I would always try him and mark him.

1523. (*Lt.-Gen. Scarlett.*) You have a licence now as far as 21 days, have you not?—Yes, to try a man for absence without leave.

1524. (*Chairman.*) Would you extend that limit for recruits?—No, I think that is quite enough, because if a man does not come back in 21 days you may depend upon it he is gone.

1525. Do you not think that many might be induced to come back if that limit of 21 days were extended to the power which a commanding officer has of dealing with the case?—I do not think it would affect the case much one way or the other.

1526. (*Lt.-Gen. Eyre.*) Considering that officers are tried invariably for absence without leave, of which there was a rather remarkable case lately in the trial of an officer by general court-martial, might it not be left to the commanding officer's discretion to judge whether a young soldier should be brought to trial for a first act of desertion, at all events, or whether he should deal with him just as he pleased?—Although the commanding officer may charge a man with desertion, the court has the power of finding him "guilty" of the lesser offence of absence without leave, and not of desertion. It is in the discretion of the court to do that if they like. If they think that the man did not intend to desert they would find him sometimes absent without leave. Sometimes you may apprehend a man

24 hours after he is gone when you know he is going to desert. At Chatham some little time ago there was an attempt to bring an officer to trial for desertion, but I said I thought that trial for absence without leave was quite sufficient, because I considered the court would naturally cashier him. Why the court did not cashier him I do not know; I think they ought to have done so.

1527. (*Mr. Mowbray.*) In that case the officer was sentenced to be placed at the bottom of his list, was he not?—Yes.

1528. There is no such punishment applicable to non-commissioned officers, is there?—No; and it is very little use doing it with the officer.

1529. Have you ever considered whether there might not be some change in the punishments applicable to non-commissioned officer, such as reduction of rank?—I think it would be useless, because you are allowed to select your non-commissioned officers according to merit for promotion.

1530. As a matter of fact the rule exists, does it not, that a commissioned officer may be sentenced to degradation in his own rank?—I think that it is a very useless sentence too, because he does just the same duties as if he had not been reduced. Very likely it might affect his promotion in his own regiment; but in our service there are so many changes that a man gets promotion out of his regiment very often.

1531. You would rather do away with that as a punishment to commissioned officers than introduce it as a punishment to non-commissioned officers?—It is no punishment to non-commissioned officers, but it might be a punishment to commissioned officers.

1532. Would it be no punishment if a staff serjeant were reduced to a platoon serjeant, or a platoon serjeant to a corporal?—It would be a punishment to reduce a non-commissioned officer, but a serjeant cannot be reduced to a corporal.

1533. Then such a proceeding is a punishment, is it not?—Yes, it is a punishment.

1534. You object to the punishment being inflicted by court-martial, but you think that it might be retained by the commanding officer?—If a commanding officer can do it, I think it is useless doing it by court-martial. If you bring a non-commissioned officer to a court-martial it requires a more serious punishment. A non-commissioned officer is supposed to be a good man; if you bring that man to a court-martial it prevents him hereafter from getting the gratuity and medal, or the medal and annuity; and it is a very serious thing if he has never been tried by court-martial before. A commanding officer has the power of punishing a non-commissioned officer to a certain degree; he may be a bad colour-serjeant, but he may not be a bad man, and the commanding officer deprives him of his colours and saves the man, it is for the man's advantage; whereas if he brought him to a court-martial his conviction carries a great deal of additional punishment with it. If he has once been convicted by court-martial he cannot have the gratuity and medal when he is discharged, and he cannot have the annuity of 20*l.* a year which is sometimes granted.

1535. Supposing the court by whom a man is convicted thinks that the punishment which might have been awarded by the court-martial is an adequate punishment for the offence proved before them, what reason can you assign for limiting the discretion of the court?—The court have nothing to do with the gratuity and medal; but the rule of the service is, that if a man is tried by court-martial he cannot have them. For instance, I would never bring an old soldier to a court-martial, although he might commit an act which would justify me in so doing. I would rather overlook that, and give him a more trivial punishment, because it tells against him when he gets his discharge.

1536. That may be a reason for not bringing him to court-martial; but is that a reason why a court-martial, if they had the man before them, should not award the minor punishment?—I think that the commanding officer had better do it himself than run the risk of trying the man by court-martial.

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

1537. Can you assign any reason why the discretion of the court should be limited?—No, there is no harm in it; but the commanding officer having the power to do it, it almost looks as if he had ill-judged the case. A commanding officer generally knows his non-commissioned officers a great deal better than the members of the court do.

1538. When a commanding officer refers a question to the decision of a court-martial he leaves it to their judgment, does he not?—Yes.

1539. And to their unfettered judgment?—Yes, but he would not do that unless it was a serious case.

1540. If, in the exercise of their unfettered judgment, they think that any particular punishment is adequate to the offence, can you conceive any reason why that judgment should be fettered by the previous contrary opinion formed by the commanding officer?—I think that the commanding officer ought to be the judge. It is like bringing a man to a higher tribunal.

1541. Are you aware, for instance, that in civil life a person can be brought before justices at petty sessions and charged with a particular offence, for which they might have the power to award a month's imprisonment, and that if they remit that question to the quarter sessions, or the assizes, the quarter sessions or the assizes may give the man only a fortnight's imprisonment?—Yes.

1542. Is there any reason why a minor punishment should not be given by the higher court, if that higher court thinks the minor punishment adequate to the offence?—No; but I think it is rather taking it out of the commanding officer's discretion to deal with the case.

1543. But does he not himself take it out of his discretion by referring it to the court-martial?—Generally speaking, if he refers it to a court-martial, he would only do it because he thought it a more serious case than he was competent to deal with.

1544. He does it with the object of giving a higher punishment?—Yes, of course.

1545. And the court-martial having heard the case think it deserves a lesser punishment?—Yes.

1546. Are the courts-martial to be fettered by the previous judgment of the commanding officer, who himself thought it necessary to refer that case to a court-martial?—I would rather let it remain as it is. Generally speaking I would rather see the man acquitted.

1547. (*Capt. Vivian.*) Your answer goes to this: that you wish a commanding officer to have the power to summon a court-martial to try a man, and then to have the still further power of saying to that court-martial: "You shall not give him a small "punishment, but you shall give him a punishment "of a certain extent, and not less"?—I think, generally speaking, a non-commissioned officer who is brought before a court-martial, if convicted, had better be reduced.

1548. But supposing that the court does not think so?—The court may not think so. My idea is, that the commanding officer knows the non-commissioned officers of his regiment, or at least he ought to know them, better than individual members of a court.

1549. (*Mr. Mowbray.*) Is not what you suggest in fact, that the commanding officer should give instructions to the court-martial what sentence they should pass as well as be the revising officer?—I do not think he should. I think the president is the man who ought to advise the court, and not the commanding officer, although the commanding officer does sometimes tell the court that he wants a strong example.

1550. Would not the proper theory be, that the commanding officer, having referred the case to the court-martial, leaves it entirely to their discretion, controlled only by the authority of the confirming officer?—Yes; courts are very queer sometimes. I

Lt.-Gen. Lord W. Paulet, K.C.B.

2 April 1868.

can assure you that I have seen courts act in a very extraordinary way, and almost, I may say, kicking against authority; and I dare say you will not contradict me on that head.

1551. (*Lt.-Gen. Scarlett.*) When a man is reduced by the commanding officer from being a staff serjeant or a colour serjeant, is it generally for some crime which he has committed, or is it for want of talent for that particular position?—Very often for want of talent, and sometimes for carelessness in his duties.

1552. But not for any serious crime?—Not for any serious crime. If a man is a very good non-commissioned officer very likely the commanding officer would give him a chance if he committed a crime.

1553. If a non-commissioned officer was reduced from one rank to another by sentence of court-martial, would he be as efficient as a non-commissioned officer in point of discipline in the lower rank as if he had not been tried? would the men respect him, and obey his orders as well if he had been punished in that way?—I do not think they would. I think that depends upon the sort of man he is, and what he is reduced for.

1554. You would rather have a corporal who had not been reduced than a corporal who had been reduced?—I would.

1555. (*Capt. Vivian.*) But is it not frequently the case that you would take the stripes off a corporal, and then reinstate him immediately?—Yes, very often; but if you gave me the choice I would rather have one who had not been broken. Sometimes men in their younger days get larking, but they may make capital soldiers afterwards. I had a serjeant in my regiment who I am sure had 1,500 lashes, and he was one of the most useful men in the regiment; and when he was discharged, after he had more than served his time, there was hardly an officer in the regiment who did not make him a present.

1556. (*Mr. Mowbray.*) Do you assume that where the commanding officer and the court differ as to the extent of the punishment the commanding officer is always right and the court is always wrong?—I think the commanding officer is generally right.

1557. But occasionally it may be otherwise?—Occasionally it may be otherwise.

1558. (*Chairman.*) Have you any idea what the expense is to which the country is put on account of courts-martial?—Not the slightest.

1559. Have you any suggestions to make with regard to the inquiry which has devolved upon this Commission with respect to courts-martial or military punishments?—I do not think I have anything more to suggest than what I have already said.

1560. (*Mr. Headlam.*) Do you think it would be desirable that any investigation should be made into the character of a man before he was enlisted?—It would be desirable if we could do it.

1561. Would there be any insuperable difficulty; an inquiry is made into the character of a man who enters the police for instance?—Yes, but we recruit all over the country, which the police do not. They always know something about a man before they take him; but the number of men we recruit in the army in a year is of course very much larger. I think it would be very advisable if it could be done, but there would be great difficulty about it. In the first place it is only lately, since this increase of pay, that we have been able to keep the army to its establishment.

1562. (*Chairman.*) Is it not a known fact that some of the best soldiers in the army are men who have got into scrapes as civilians?—Yes, no doubt; and many who are scamps at the beginning of their military service, turn out capital soldiers afterwards. I do not care about a scamp, it is an insubordinate soldier that I do not like; I mean a fellow who is not amenable to discipline.

1563. If you were to investigate the character of every man who offers himself as a recruit, do you not believe that a very large amount of the best soldiers in the army would be lost?—Yes, I do. In fact, it is generally the scamp who comes to the army; it is generally a wildish sort of fellow.

1564. (*Lt.-Gen. Eyre.*) With regard to the minor punishments, would you like to strengthen the hands of the commanding officers still further, and give them more power, subject to such conditions as would have to be given out by your department?—You might perhaps sanction 14 instead of seven days' imprisonment.

1565. You do not think that such an alteration would be beneficial?—You might give them stoppage of pay; but I think it is dangerous to put too much power of stopping pay in the commanding officers' hands, for fear of making the soldiers discontented.

1566. Could you give a commanding officer more power than he has of fining, subject to a power of appeal by the soldier?—A soldier has the power of appealing now as to his pay.

1567. You might continue that appeal, of course with regard to any other power?—I am quite in favour of the commanding officer having all power to fine a man for being drunk. It would save a great many courts-martial for habitual drunkenness.

1568. (*Maj.-Gen. Horsford.*) With a power to appeal on the part of the soldier?—Certainly.

1569. (*Lt.-Gen. Eyre.*) Might it not reduce the number of courts-martial?—Yes. In that committee to which I have referred they recommend that.

1570. (*Maj.-Gen. Horsford.*) Do you know that the captain of a ship can positively give three months' imprisonment?—Yes, and he can give a man 48 lashes; but their powers are lessened a good deal now, I believe. They cannot flog now for 48 hours after the offence. A certain interval must be allowed, I believe, and a certain investigation must take place.

1571. (*Capt. Vivian.*) Are prisoners sentenced by court-martial always sent to military prisons?—When I commanded the South-western District I never committed anybody to a civil gaol.

1572. But is it not necessary sometimes, on account of the military prisons being full, to send prisoners to civil gaols?—I expect at Aldershot they have not always room, but it was not so at Gosport.

1573. If that be so, do you not think it would be advisable in some way to increase the accommodation in military prisons, so that military prisoners may be kept quite distinct from civilians?—Certainly; even at Gosport sometimes I used to bed the men in the day rooms when there were not separate cells enough, rather than commit them to civil gaols.

1574. Do you not think that it would be a good thing in those military prisons to utilize the prisoners' labour in some way, and to adopt a system of useful labour, instead of useless labour?—Certainly.

1575. (*Maj. Gen. Horsford.*) Do they feel the punishment more when they are doing nothing useful?—I think they do. It will not do to make the punishment too pleasant, otherwise the men would not care about doing it.

1576. (*Chairman.*) Should you have any objection to put in the report of that committee of which you have spoken?—I sent it to the War Office, hoping to have got the purport of it entered in the Articles of War for this year; but then Sir John Pakington informed me that a Royal Commission upon courts-martial was just appointed, and that he was afraid it could not be done. I expressed a hope that it would be put before the Commission.

1577. It is not in your power to do so?—No. It is gone to the War Office; but I think Sir John Pakington would have no objection to do it, as he told me himself that he would do so.

The witness withdrew.

COLONEL JOSEPH HENRY LAYE re-called and further examined. *Col. J. H. Laye.*

2 April 1868.

1578. (*Chairman.*) Can you state to the Commission the number of general and district courts-martial which were held, in the district of which London is the head-quarters, in the year 1866?—In the year 1866 there were 2,281 district courts-martial; 900 of which were for desertion, 221 for insubordination, 306 for drunkenness, and 854 for miscellaneous offences.

1579. What was the number of general courts-martial?—Of general courts-martial there were eight in that year.

1580. What were the offences tried in the general courts-martial?—They were all for insubordination, and generally for insubordination accompanied with violence.

1581. Was drunkenness included in the insubordination in any of those cases?—Only in one or two instances. There was a question asked about the discharging of those men. There were eight general courts-martial assembled in that year, and seven out of the eight of those men were discharged from the service as bad characters.

1582. What other sentence was attached to the discharge?—Four were awarded corporal punishment, two penal servitude, and two imprisonment.

1583. For how long was the penal servitude?—Terms of five years and seven years.

1584. And for how long was the imprisonment?—Two years.

The witness handed in the following statement.

GENERAL COURTS-MARTIAL IN 1866.

Crime.	Punishment.
1. Violence to superior officer.	Corporal punishment, two years' imprisonment, and forfeiture of all service.
2. Insubordination accompanied with personal violence.	Corporal punishment, two years' imprisonment, and discharge from the service.
3. Striking a medical officer.	Corporal punishment, two years' imprisonment, and discharge from the service.
4. Insubordination and traitorous language.	Two years' imprisonment and discharge from the service.
5. Insubordination -	Two years' imprisonment and discharge from the service.
6. Insubordination, attempting to shoot a serjeant.	Five years' penal servitude and discharge from the service with ignominy.
7. Endangering the lives of soldiers by firing off a loaded musket, and making away with ammunition.	Corporal punishment, two years' imprisonment, and discharge with ignominy.
8. Disobedience and attempting to shoot a serjeant.	Seven years' penal servitude, and discharge from the service.

1585. What was the number of district courts-martial in the year 1867?—There were in the year 1867 2,320 district courts-martial.

1586. How many general courts-martial were there?—Sixteen general courts-martial.

1587. What was the description of crimes in 1867?—I have here a statement which will give that information.

The witness handed in the following statement.

GENERAL COURTS-MARTIAL in 1867.

Crime.	Punishment.
1. Desertion and striking the surgeon.	Ten years' penal servitude, discharge, and "B C."
2. Insubordination and traitorous language.	Two years' hard labour, discharge, and "B C."
3. Striking a corporal -	Two years' imprisonment.
4. Striking his commanding officer.	Acquitted.
5. Insubordination, accompanied with personal violence.	One year's imprisonment.
6. Stabbing a serjeant -	Seven years' penal servitude, discharge, and "B C."
7. Desertion, fraudulent misapplication of post-office orders.	Reduction, one year's imprisonment, stoppages.
8. Striking and stabbing a corporal.	One year's imprisonment.
9. Insubordination, accompanied with personal violence, and damaging one round of ammunition.	Acquitted of the first charge, 56 days' imprisonment and stoppage for one round.
10. Insubordinate language to adjutant.	Two years' imprisonment, discharge, "B C."
11. Writing letter to commanding officer reporting the surgeon.	Acquitted.
12. Insubordination -	Two years' imprisonment, discharge, and "B C."
13. Insubordination -	Two years' imprisonment.
14. Insubordination accompanied with personal violence.	Fifty lashes, two years' imprisonment, and forfeitures.
15. Striking the surgeon	Fifty lashes, two years' imprisonment, and forfeitures.
16. Personal violence to non-commissioned officer.	Fifty lashes, two years' imprisonment, discharge, and "B C."

SUMMARY.

Acquitted - - -	3
Penal servitude - -	2
Corporal punishment -	3
Imprisonment -	8
	16

1588. Can you classify the offences tried by district courts-martial?—800 were for desertion, 204 for insubordination (and 40 of those were accompanied with drunkenness), and there were 326 cases of drunkenness, and 900 were miscellaneous offences. It is supposed that drunkenness is the principal crime in the army, but such is not the inference from this return. With regard to many of those cases of desertion, they were cases of young lads who had only enlisted, perhaps, a day or two and found the work unpleasant, regretted that they had enlisted, and deserted; but there were not so many desertions of older soldiers.

1589. What do you say is the crime which in your district has preponderated?—Desertion.

1590. Under the circumstances which you have just mentioned?—Yes, principally.

1591. In what proportion was the insubordination committed by the men in a state of drunkenness?—Out of the 204, 40 of those men I see I have marked as having been drunk at the time of committing the offence, but that is scarcely a fair criterion, because when men have committed an act of insubordination when drunk the offence of drunkenness is not always charged. Out of those 16 men tried by general courts-martial, eight were discharged the service.

1592. (*Lt.-Gen. Eyre.*) Were they marked as well?—Yes; they never discharge a man by court-martial without marking him.

1593. (*Chairman.*) Have you any suggestions to make to the Commission with regard to the crime of disgraceful conduct?—Yes; I should like to see men who commit small petty offences of theft not charged with disgraceful conduct. Many instances occur where a young lad may be tempted in a moment to steal a penny or twopence, for which a summary punishment would I think be sufficient; but at present

Col. J. H. Laye.
2 April 1868.

such an offender is often charged with disgraceful conduct, tried by court-martial, and perhaps sentenced to forfeiture of all advantages and discharged.

1594. Can a petty theft of that kind be dealt with by the commanding officer?—I should have no hesitation in dealing with it myself, if a young lad was brought before me.

1595. In practice is it so?—I should think it might be done, and no doubt it is sometimes done. I do not like to see a young lad tried for disgraceful conduct who has committed an offence of that kind.

1596. But what is the practice?—The practice is generally to try him by court-martial.

1597. (*Lt.-Gen. Scarlett.*) Is there not a letter from the Horse Guards relative to disgraceful conduct, I think it was in the Duke of Wellington's time?—Yes. There was such a letter on the 19th of November 1849, and disgraceful conduct was defined in it. That letter is now, I think, obsolete.

1598. Can you state the substance of that letter?—It defined what offences should come under the head of disgraceful conduct,—repeated acts of theft, and acts of a vicious and unnatural kind.

1599. (*Chairman.*) Was that definition different from what is given in the Articles of War?—The Articles give a wider scope of offences.

1600. (*Lt.-Gen. Scarlett.*) Was the letter for the purpose of discouraging the frequent charges of disgraceful conduct?—I think it was.

1601. (*Chairman.*) What further remarks have you to make on the crime of disgraceful conduct or its punishment?—I should like to see the commanding officer have the option of not charging a man with disgraceful conduct who commits some petty offence.

1602. The commanding officer is obliged now to charge him with disgraceful conduct for petty thefts, is he not?—I think so. Stealing from a comrade comes under the Articles of War as "disgraceful conduct."

1603. Have you any further suggestions to make upon that head?—I have not.

1604. Would you suggest any alteration in the punishment for habitual drunkenness?—I mentioned the last day the Commission sat that I would increase the power of courts-martial to increase the amount to be stopped from the man's pay; now it is 1*d.* a day up to 3*d.* for three distinct convictions, but I suggest that the court should be empowered to put a man under stoppages up to 6*d.* for three convictions. That would not tell upon the captain. It is not like stoppages for necessaries, in that case a man's kit is bought at once out of the quartermaster's store and paid for there and then by the captain of his company; but it is not so with regard to stoppages for habitual drunkenness.

1605. Have you any opinion to give with regard to the application of fines for drunkenness?—I should be sorry to see them applied to any present benefit of any of the soldiers, because I think it would very much reduce the feeling of comradeship which now exists among soldiers; for instance, if 20 men of a regiment had been fined a certain sum, say 10*l.* during the year, and that was to be employed for the benefit of the men, say in the shape of a better dinner at Christmas, it would, I think, create a bad feeling, and at the same time the good men would not like to benefit at the expense of the bad men.

1606. Is it not the case that under the present system you can only stop a soldier's pay when he does not perform his requisite service to his country, and is not that the principle under which the stoppage of pay is inflicted?—No; as to these stoppages I think the object is to reduce the amount of money in the man's pocket, so as to prevent his spending so much in liquor.

1607. But you cannot now stop a man's pay for simple drunkenness?—No, it must be for habitual drunkenness.

1608. In the case of habitual drunkenness then, stoppages of pay are a punishment?—Imprisonment is also generally awarded. The stoppages operate partly as a punishment, and partly as a method of depriving the soldier of means to purchase liquor.

1609. Might it not result in dissatisfaction in the army if you were to stop a soldier's pay for a fortnight, say for being drunk once?—I think it would tend to diminish drunkenness.

1610. But might not the soldier then say that he had rendered a service to his country, for which he had not been paid?—He might.

1611. And that is not the case now, is it?—No; not to the same extent.

1612. Is it not the case that now no soldier can say that he has had his pay stopped, except in instances where he has not been able to perform his duties to his country?—A man's pay cannot be entirely stopped except for the crime of absence without leave or desertion. If a system of fines were introduced for drunkenness, I would suggest that the fines should be appropriated to a fund for men who have put in 21 years' service and are discharged with exemplary character.

1613. You would recommend that the fines should be applied differently from what they are now?—At present the War Office take the stoppages.

1614. And you would recommend that they should be applied to another object?—Yes, if those fines are instituted.

1615. (*Viscount Eversley.*) You would apply the fines as a reward for the good conduct of a soldier after a long period?—I would.

1616. (*Maj.-Gen. Horsford.*) Do you mean in his own regiment?—Yes, in his own regiment.

1617. (*Chairman.*) With regard to the punishment of imprisonment, have you any suggestions to offer?—I should like to see that altered.

1618. In what way?—I would have it more utilized. Shot drill, although it may be very irksome to the men, is of no use to the country, and I would rather see the treadmill introduced, or some means of grinding corn or pumping water, or something of that kind.

1619. Has not the punishment of shot drill this advantage, that you can apply it in whatever quarters the regiment may be?—That is so.

1620. A treadwheel can only be erected at great expense, and very few regiments can profit by it?—No, but you can have it in the military prisons. I presume there is a treadmill in Winchester gaol, for instance, and when the military prisons are full at Aldershot or Gosport the men are sent to Winchester gaol, and I have no doubt they have to undergo the same punishment as any civil prisoner would when he is sentenced to hard labour.

1621. Is it your impression that from the frequency of courts-martial in the army at the present time the soldiers are led not to look at them with that dread that they would feel if they were less frequent?—No, I think a soldier looks upon a court-martial as the fairest tribunal before which he can be tried, and feels sure that if he is innocent he will be acquitted, and that if he is guilty he will be punished. I should be very sorry to see any new system introduced with regard to courts-martial.

1622. (*Capt. Vivian.*) Will you specify what you mean by the new systems that you would object to?—I have heard it suggested that a barrister or civilian should be the president of the court-martial, but that I think would be a very unpopular thing with the soldiers.

1623. (*Chairman.*) Have you any other suggestions to make?—I have not.

1624. (*Capt. Vivian.*) You would object to a barrister being at the head of a court-martial?—Yes.

1625. Would you object to a civilian taking any place as a friend of the prisoner in a court-martial?—There is no objection to that now.

1626. Would you object to the civilian's reading the prisoner's defence?—Yes, I should.

1627. On what ground?—I would rather see an officer of the regiment read it. I think it would be injurious to the prestige of a court-martial for any civilian to address a military court.

1628. How do you mean the prestige of a court-martial?—I think a soldier feels perfect confidence in a court-martial.

1629. But now a soldier who is comparatively an illiterate man is tried by a court-martial, the trial being conducted by a Judge Advocate and a prosecutor both of whom are men of education?—Yes.

1630. The prosecutor draws up the case and gives evidence against the prisoner, does he not?—I should object to the prosecutor giving evidence against the prisoner, and I have objected to it in some cases.

1631. At all events he addresses the court against the prisoner, and sums up against the prisoner?—Yes.

1632. The prisoner being a comparatively illiterate man, cannot prepare his own defence, but he has the power to get somebody to do it for him, and then you say he must read it himself?—The president would read it for him, or the Judge Advocate would do so. But I have already recommended that on a general court-martial the private soldier should have the benefit of the presence of an officer of his regiment to watch the proceedings on his behalf; and if necessary to suggest questions in examination of the witnesses, and to draw up the prisoner's defence and read it for him.

1633. To what other innovations in courts-martial would you object; would you object to courts-martial having the power to declare their finding without its being referred to a superior power?—Yes, I should be very sorry to see that power taken out of the hands of the General of the district or the commanding officer of the regiment.

1634. You wish those powers to remain?—Yes, I do.

1635. Why?—I think they act for the benefit of the prisoner in most cases.

1636. But you know that it is not so in the navy?—I am aware that it is not so.

1637. A naval court-martial has the power at once to announce its sentence, and the result of a military court-martial not being able to do so is that the court-martial is in fact only a court of report; is not that so?—It is more than a court of report, because they come to a finding and award punishment.

1638. But the sentence has no effect until it is confirmed?—It has not.

1639. And it may be entirely remitted, may it not?—That is a power which I should be very sorry to see taken out of the hands of the general officer.

1640. Why do you think it is so necessary?—Because I think it adds to the fairness of the trial. A soldier, if he is tried by court-martial, knows that he has the honour of the court to depend upon, to investigate the case fairly, and beyond that he has the honour of his general officer to see that they have adjudicated rightly.

1641. Supposing a soldier is tried by a regimental court-martial, and the regimental court-martial thinks that the soldier should be punished with a very slight punishment, but his commanding officer thinks that he should be more severely punished, do you think that it adds to the fairness of the trial that the commanding officer should have power to re-assemble that court and insist upon its inflicting a more severe punishment?—But he has not the power of insisting. The court may adhere to their former sentence, and in most cases they would do so.

1642. And during all that time the man is under confinement?—A regimental court-martial does not take very long. If it assembles in the morning the sentence is confirmed in the afternoon. It is generally read at afternoon parade, and the man is sent off to prison.

1643. There may be such a thing as some legal objection, in which case the man would be confined nine or ten days. Do you see any reason why a commanding officer, assembling three officers of a regiment to try a private, and leaving it to them to investigate the merits of the case upon which the man is tried, these officers should not then have the power of declaring what his punishment should be, and of at once announcing his sentence?—I would rather see it left as it is.

1644. That the commanding officer should still have the power to confirm or to remit entirely?—Certainly, clemency at the last moment is often very effectual for discipline. A commanding officer might think it necessary to bring a man to a court-martial, and yet would do quite right in remitting any sentence awarded by the court. Take the case of a non-commissioned officer who is sentenced by a court-martial to be reduced. The commanding officer has power to remit that sentence, whereas if he had no power to remit, the man's position is gone.

1645. With regard to the higher grades of general courts-martial, a general officer on distant foreign command has very great power over the finding of the court-martial. Having been compelled by military law to sentence the prisoner to a certain punishment, the court-martial may think that there are certain circumstances in the case which justify a recommendation to mercy. If the Commander-in-Chief happens to have a bias against the man he may not attend to the recommendation of the court. If, on the other hand, he happens to have a bias in his favour he may entirely remit the sentence. Do you not think that, considering that prisoner has been tried by a court-martial composed according to present law of nine officers, who have attentively tried his case, they would be perfectly capable of deciding upon the punishment that he should receive; and that it is quite unnecessary to make this remarkable distinction between martial law as administered to the soldier and martial law as administered to the sailor?—I am not conversant with courts-martial in India, and therefore I can only speak of those at home, but I think it would tell equally there. The court-martial abroad might pass a severe sentence upon an officer, and yet the general officer might be inclined to remit a portion of it.

1646. Can you give any reason which is satisfactory to your own mind why this great difference between the administration of martial law to the soldier and the administration of martial law to the sailor should exist; why in fact courts-martial for military purposes should be only courts reporting to a superior officer for confirmation, and in the naval service should have the power of at once pronouncing the sentence?—Officers in the army are usually under the command of a general officer present or within easy communication. Whereas in the navy there may be only one or two ships at a particular place, and they have no officer corresponding to a general officer on the spot.

1647. Does any other reason than that suggest itself to your mind?—No.

1648. (*Mr. Mowbray.*) With respect to the revision of courts-martial, you say that a regimental court-martial is generally concluded in one day?—Generally speaking it is.

1649. So that there is no delay there?—There is not.

1650. Is there much delay with the general of a district in confirming the proceedings of a district court-martial?—None whatever, unless he requires to make a reference to the Judge Advocate-General's office.

1651. With respect to general courts-martial, you are in the habit of attending them in those districts where you act as Deputy Judge Advocate, are you not?—Yes, everywhere south of Manchester.

1652. Supposing you go to Chatham to attend a court-martial on Monday, and the trial is concluded that day, you bring up with you the proceedings to the Judge Advocate-General's office?—Yes.

1653. And they arrive at the Judge Advocate-General's office on Tuesday morning?—The first thing on Tuesday morning.

1654. Supposing the prisoner is acquitted, in the ordinary course of things the Judge Advocate-General

Col. J. H. Laye.
2 April 1868.

forwards on the same day to Her Majesty a *précis* of the case with his advice upon it?—Instantly.

1655. And he also sends over the original proceedings of the trial to the Commander-in-Chief at the Horse Guards to inform him?—As soon as ever the clerk can do it it is done.

1656. In fact, ever since the practice which came into force about 18 months ago there has been no delay at all in promulgating the result as soon as possible?—None whatever.

1657. In cases of conviction with sentences of imprisonment or penal servitude all such proceedings are from time to time submitted to Her Majesty?—They are.

1658. But the sentence when confirmed dates from the day when it was passed?—When it was signed by the president.

1659. That is to say, neither the penal servitude nor imprisonment are lengthened by a day owing to delay in transmitting the proceedings to Her Majesty?—There is no delay at all. I think that in the very last case of acquittal we had I brought the proceedings to you in the morning, and while I was there the *précis* was taken and it was sent off immediately to Buckingham Palace, and was forwarded that evening by Queen's messenger to Balmoral.

1660. And in all cases of conviction the delay, such as it is, is rather in the prisoner's favour, is it not, because it affords greater opportunity for considering any points in his favour?—Certainly.

The witness withdrew.

Capt. L. A. Hale, R.E.

CAPTAIN LONSDALE AUGUSTUS HALE, R.E., called in and examined.

1661. (*Chairman.*) You are an officer of the Royal Engineers, are you not?—Yes.

1662. How long have you been in that service?—Between 14 and 15 years.

1663. During that time has your attention been directed much to the subject of courts-martial?—Yes, for about the last six years I have studied the subject a good deal.

1664. Officially or merely as an officer of the service?—Merely as an officer of the service. I have always been attached during my service to the Sappers, and therefore I have had more opportunity of seeing the practice of the service in such matters than engineer officers generally would have.

1665. Have you any suggestion to make to the Commission, first of all, as to the constitution of general courts-martial?—With respect to general courts-martial the great fault appears to be first of all with regard to the mode of determining whether evidence shall be received or not. Although the Judge Advocate has a certain amount of power in determining the question, the whole of the 13 or 15 officers who may compose the court have an equal voice upon the subject. The consequence is that any one of those 15 officers may have the court closed, and may divide the court upon every single question which is submitted to it. Therefore that would show that the number is a great deal too large.

1666. But does it follow from what you have stated that the number is too great?—You have 13 different judges, not a jury of 13. I think that it is very desirable first of all with regard to determining questions of law that you should reduce your number. Members of courts-martial are supposed to know military law, but very few of them do; and it is very desirable to reduce the number and increase the responsibility of each member.

1667. Is not the Deputy Judge Advocate who attends each general court-martial the authority who decides the law upon such questions?—I heard this morning that he was, but I was not aware of it. The circular says that his opinion ought to be conclusive, but I am not aware that his opinion has necessarily more weight with the court than that of a member.

1668. What do you consider then to be the duty of the Deputy Judge Advocate?—The duties are defined in the Queen's Regulations, but a good deal is left optional with the court as to whether they will take his advice or not. He cannot control the court according to that circular as I read it. The circular says, that his advice ought to be conclusive on all points of law, but not that it shall be followed.

1669. Is it your opinion that it ought to be conclusive?—Certainly.

1670. (*Capt. Vivian.*) Do you think that it ought to be absolutely conclusive?—Certainly.

1671. (*Chairman.*) And that the court should be deprived of the power which it now enjoys of deciding upon such questions?—Certainly.

1672. And then there would be no objection to the court remaining as it is now of the number of 13?—Certainly not.

1673. (*Mr. Mowbray.*) Are you aware that the number is reduced this year to nine by the Mutiny Act?—I have not seen a copy of the Mutiny Act of this year. I would have the opinion of the Judge Advocate final on all those points. He should rule the court to that extent, but he should not preside over the court.

1674. (*Chairman.*) He does not preside over the court now?—He does not.

1675. With regard to the finding of the court, do you think that the present mode of the junior officer giving his opinion first is a good one?—Certainly, I would maintain that.

1676. Do you agree with the opinion of a former witness that the votes should be given from flanks to centre?—I do not see any necessity for it. With regard to district courts-martial, I should certainly place them under the control of either a president educated in military law or else of an officiating Judge Advocate. At the present moment they are under no control at all.

1677. It is not necessary that the Deputy Judge Advocate should attend a district court-martial, is it?—Not in the least; I would make it obligatory that there should be one; but it would be preferable I think that he should preside over the court.

1678. Why would you make that distinction between a district court-martial and a general court-martial; what reason is there for the Judge Advocate presiding in one case and not in the other?—It was more with reference to having an educated president than to having an officiating Judge Advocate at the district court-martial. At general courts-martial the members are sometimes of very high rank, and it might be inconvenient to have a comparatively junior officer presiding over them. This objection does not apply to district courts-martial if the officiating Judge Advocate had *ex officio* the rank of field officer.

1679. What rank is the lowest which you can have presiding over a district court-martial?—A field officer, except where a field officer cannot be had, and then it should be a captain.

1680. Could a Deputy Judge Advocate always be had for district courts-martial?—No, but you might have men who had passed through an examination in military law, and who would be qualified to act as president of a district court-martial.

1681. Should he be an officer in the army?—Yes, an officer in the army. The point, if I may be allowed to mention it here, at which I would wish to arrive is this: If you concentrate your military knowledge among a few men you will injure the military knowledge of the officers generally. If a general court-martial is to be governed by a Judge Advocate, and a district court-martial is to be governed by a Judge Advocate, and a regimental court-martial is to be governed by a Judge Advocate, the officers will not generally study military law. They do not study it now much, but they would then study it still less. What I think that we should aim at is the diffusion of a general knowledge of military law and the practice of military courts among the officers generally, and

at the same time to hold out appointments as an inducement to officers to study military law.

1682. You say that officers do not study it much?—They do not study it at all that I am aware of.

1683. You are aware that under the Queen's Regulations commanding officers of regiments are directed to examine officers to see whether they are efficient for the purposes of courts-martial?—I think that the commanding officer can only examine them in the Mutiny Act and the Articles of War. He cannot see whether they have any real judicial knowledge or whether they are fit to act as judges. With regard to the constitution of regimental courts-martial, I should certainly keep them as they are, but there are certain provisions which I should like to suggest.

1684. What are they?—First of all I would allow a power of appeal on questions of law and procedure from a regimental court-martial. In foreign services, the codes of which I have studied, a power of appeal lies from nearly every court. Regimental courts-martial as they are now constituted and according to the custom of the service are more instruments in the hands of commanding officers than anything else. By the Queen's Regulations a commanding officer is almost forbidden to send for trial any soldier unless a conviction is pretty certain, and there is a General Order, Horse Guards, 7 May 1801, to the same effect. The consequence is that when a soldier comes before a court-martial the officers of that court know that the commanding officer is liable to censure if the prisoner is acquitted, and the prisoner himself knows of the existence of this Regulation, that he would not have been sent there if the commanding officer had not thought that he was guilty. Now I maintain, with all due deference to those who are of a contrary opinion, that that puts the prisoner in a very wrong position, and puts the officers in a very wrong position also. They naturally have a sort of bias (though I do not say that they feel it) against the prisoner. They think he must be guilty, or else he would not be there, because the commanding officer would not lay himself open to censure. I think that that is a faulty regulation. The consequence is that regimental courts (though I do not say it prejudices them) are accustomed to judge nothing but guilty men, and when a case come before them which is really a matter of evidence on both sides, I do not think that they are quite in that unbiassed and unprejudiced state of mind that they ought to be. Then I would have an appeal open from this regimental court to some other court, not to a district court, but there should be an appeal on certain points as to whether evidence was rightly or wrongly refused, and whether the procedure was right. I would have an appeal to a court composed, say, of a field officer and an officiating Judge Advocate, and perhaps an officer who had passed an examination in military law.

1685. You would not recommend that there should be a power of appeal from a regimental court-martial to a district court-martial?—No.

1686. Nor from a district court-martial to a general court-martial?—I should prefer having a separate court of appeal.

1687. (*Viscount Eversley.*) Of how many officers should it consist?—I think three would be enough. I have not that dread of barristers myself which most officers appear to have; and I think that if a barrister could be got upon the court of appeal it would be a great advantage.

1688. (*Maj.-Gen. Horsford.*) Is that the French custom?—It is not so in France, but it is in Belgium; and it is the same in the Italian service.

1689. (*Mr. Mowbray.*) You would have your court of appeal consist of two officers and a barrister?—Of two officers and a barrister.

1690. (*Capt. Vivian.*) A field officer, an officer versed in martial law, and a barrister?—Yes.

1691. (*Chairman.*) How would you arrange the courts of appeal, would you have a court of appeal in each district?—That must depend upon circumstances. I could hardly answer that question. A great fault I think in our system is, that we try to make the same system applicable in Otaheite which we use in London. It is obvious that a civilian in Otaheite does not have the same advantages which we get in London as regards the administration of the law. Why are you to have an inelastic system which must be used in London and Aldershot because it may be used in the Falkland Islands.

Capt. L. A. Hale, R.E.

2 April 1868.

1692. But applying it only to England, how would you propose to distribute the courts of appeal in this country?—Perhaps one to every military district, but I have hardly gone into the details.

1693. But in a case of this kind a good deal depends upon carrying it out in detail?—Exactly. You might take two divisions and have one court of appeal for the two divisions if you found that there was not work enough in one division. In the same way in the French service; they have eight courts of appeal; they found it necessary to reduce the number on account, of course, of the variety of conflicting decisions; and therefore they have fewer *conseils de revision* as they are termed than they had at first.

1694. Are they arranged in districts?—There are eight courts of appeal and there are 21 districts. In 13 of these a second military court sits, making eight appeal courts to 34 of first jurisdiction.

1695. But you know that France is divided into districts with a certain number of courts of appeal?—Yes. Then again with regard to regimental courts-martial, the position of the prisoner before those courts is altogether wrong in my opinion. He has no defender at all. Under the foreign systems, in France, and Belgium, and Italy, the prisoner has a *défenseur*. If he does not make choice of somebody to defend him the president of the court chooses somebody to defend him, who may be either a military man or a barrister. I am told that in France if a barrister is called upon for that duty he is bound in honour to accept it, and therefore they have no difficulty there, though we might have a great amount of difficulty in England in obtaining that assistance. At present you cannot get an officer or a man to defend a prisoner, or it is very difficult to do so, for the reason which I have already stated. If my commandant at Sandhurst ordered a man to be tried I should know that that man would be convicted, since for the reasons I have mentioned we try hardly any but guilty men in the service, and I should not like to appear in the court in direct opposition to my commandant, though I might do it if I thought that it was an extreme case and if I thought that the man was innocent. A non-commissioned officer to whom I was speaking yesterday told me that in his old regiment a prisoner was tried by a regimental court-martial, and he got an intelligent soldier to defend him, and the non-commissioned officer's words to me were, "He never forgot it. The colonel never "forgave him." It is a very natural thing, I think, if a colonel is to be censured for sending a man to trial, that the colonel should not regard with a favourable eye the man who defends the prisoner and gets him off. Then there is a great deal of unnecessary record in a regimental court-martial, and a great amount of writing. We know what the practice is; the president of course governs the court pretty well, and he says to the member on his right, "You write the "proceedings, will you not?" and the member says, "Yes, I will write them," and he rattles them off as quickly as he can, questions and answers. It is very weary work to sit on a court-martial. Members get wearied with all those proceedings, and the consequence is that courts cut examinations short. They do not like the trouble of entering all those questions, many of which doubtless are rather irrelevant; but the prisoner may feel rather hardly dealt with if they are not put. I may mention a case in which I was prosecutor where a prisoner was tried for being drunk, and this question was put by the prisoner in cross-examination of a witness—"Have you not said "that you would be down on me the first opportu-"nity?" "Oh," the president said, "I do not think

Capt. L. A. Hale, R.E.

2 April 1868.

"that there is any need to enter that question. We "are not trying you for what the witness said, but we "are trying you to see whether you were drunk or "not." I knew that the man was drunk, because he came to me drunk. After that question had been put the court thought it over again, and the president said, "Well, if you like we will enter "the question." "No," the prisoner said, "I do not "care whether the question is entered or not." If that question had been entered, and it had been shown that it had not been allowed to be put, I doubt very much whether it would have been approved of finally.

1696. But that is a defect which may arise in any court; it is an omission of duty upon the part of the officer?—Yes; but if this non-commissioned officer had had some educated man to look after his interests it would not have occurred. If I had been looking after his interests I should have insisted upon its being put, or at all events upon its being on record.

1697. (*Lt.-Gen. Eyre.*) You said that an officer's being employed as a defender for prisoners in general would place him in an unpleasant position with his commanding officer, but if an officer was told that it was his special duty to take up that line and to be the counsel, as it were, of the prisoner, with power to cross-examine witnesses, surely that unpleasantness would never exist?—I think that very few officers would care to undertake the task of defending a prisoner in every case. I might have a thorough scoundrel in my company, and having investigated the circumstances myself, knowing that the man's case was a bad one, and that he was a blackguard and altogether guilty, I should not wish to appear before the court as his defender.

1698. Supposing an officer of a regiment were told off, not merely Captain A. to-day and Captain B. to-morrow, but specially to be the asseseor, or the military defender of the prisoner, with all proper powers, surely that unpleasantness between him and his commanding officer would never exist in our service?—Of course your experience will be greater than mine, but do you not think that it would be unpleasant to have an officer in the regiment known as the "prisoner's friend."

1699. Not a bit. He would be a very useful man to his commanding officer. He should merely watch the interests of the prisoner, and it might be, say, a captain who performed that particular duty?—I am assuming that that takes place under the present regulations. Under the present regulations a commanding officer sends to the court-martial every man who he feels convinced is guilty, and by your supposition another officer attached to the regiment is doing all he can to get off every man.

1700. But you must apply that to every case civil and military?—The difference is that you have a man permanently in the regiment who is employed to look after the prisoner's interest and get him off if he can.

1701. That is the duty of every counsel for a prisoner?—Yes.

1702. (*Maj.-Gen. Horsford.*) At present is it not the Judge Advocate's duty to look after the interests of the prisoner?—Not to try and get him off. This officer must get up the defence and he must examine witnesses beforehand, in order to defend a prisoner properly.

1703. (*Lt.-Gen. Eyre.*) Would he not do what the adjutant does now, but more efficiently and more independently, it being his special duty?—I do not see how it would work. If the regiment were in a state of insubordination how could an officer go to the prisoner and get from him and his comrades evidence against his commanding officer? I do not think you would find that officers would do it. Every officer is interested in keeping up the discipline of the regiment, and an officer would object, I think, to try and get up a case for a prisoner.

1704. (*Mr. Mowbray.*) In fact you think that there should be confidential relations between the prisoner and any one employed to conduct his defence?—Quite so.

1705. And that he should be able to disclose to the person conducting his defence anything which he may think necessary?—Exactly.

1706. And yet that it might be occasionally inconvenient that he should make those disclosures to a person holding superior military command over him?—Exactly so. There is another instance, if I may bring it forward, which would show the want of a *défenseur*. On a court-martial on which I sat at Aldershot, a prisoner was charged with making a frivolous and vexatious appeal against his commanding officer. I happened to know the circumstances of the case, and that the complaint was not frivolous and vexatious. When the prisoner was brought before the court, to my utter astonishment he pleaded "guilty;" I knew, as I say, what the circumstances were, and was enabled to conduct a cross-examination which elicited evidence to show that the complaint was perfectly just against his commanding officer, and the consequence was that the court, if I remember rightly, recommended the prisoner to alter the plea, or at all events sent in such a finding as enabled the prisoner to escape. Then we asked the man "Do you know the nature of this charge against you?" He said, "Yes, I made a complaint." "Yes," but we said: "it is a frivolous and groundless complaint. "Oh!" he said, "I don't know what that means."

1707. (*Chairman.*) You think that if he had been advised that could not have happened?—It could not. Then there is no appeal at present from regimental courts for irregularities. You are not sure that the record of the court will be correct; you cannot tell what questions are refused, or anything of that sort; you have no check upon the proceedings of the court; but there would be a check if this power of appeal which I venture to suggest existed. The court is supposed to be public, but it is not public. The court is frequently held in the ante room or mess room, and no soldier would think of going in and listening, and it would be dull work for him if he did.

1708. Do you think that it would be advantageous that all courts-martial, whether regimental, district, or general, should be open to the public?—Very much so. That would be a check upon the court at once, and then I should lay particular stress upon that alteration of the regulation which prohibits commanding officers sending only men whom they think "guilty" for trial. Regimental courts-martial are too much courts for giving greater punishments than commanding officers can give. They lose sight of the fact that they are courts for the investigation of whether a man is guilty, or not guilty.

1709. (*Mr. Mowbray.*) You do not agree with what a previous witness has said to-day; you do not feel it to be a necessity that a regimental court-martial should award a higher punishment than a commanding officer could award of his own power?—I do not, because the commanding officer has not the time to investigate cases which may be brought before him. In the case, for instance, of drunkenness, it is a very difficult thing for a commanding officer to determine in the orderly room, where the evidence is not upon oath, where perhaps a man is brought up a very few hours after the alleged offence, whether the man was drunk or not. With regard to habitual drunkenness, that is a very common crime, as the Commissioners are aware. The court take their seats, the adjutant comes, he brings the record and the defaulter's sheet. It is simply recording the number of instances, and receiving the proof of one other instance of drunkenness; courts are over and over again called to do that. That tends to increase the feeling that the man is guilty, and that they merely act as a court of record and give the higher punishment.

1710. Instead of that second court-martial which you have suggested, would it not be better to have a regimental court-martial composed of a higher class of officers, such as a field officer, two captains, and two lieutenants, instead of the court which they have

at present, which is generally a captain and four young subalterns?—Yes; although I have been saying that you should not have an inelastic system, it is very desirable, considering our regimental system and a great number of detachments that we have, that you should not render the presence of a field officer absolutely necessary. If you get a captain and two subalterns your court is constituted; that is a great advantage of course, but if you were obliged to have a field officer there would be great inconvenience in it. Although it seems hard that the officer should be practised at the expense of the men, I think it is desirable that the regimental officer should be frequently on regimental courts-martial.

Capt. L. A. Hale, R.E.

2 April 1868.

1711. (*Lt.-Gen. Eyre.*) Would not courts-martial if composed of the higher class of officers become more rare, because no doubt the change would be accompanied with more power to commanding officers to deal summarily, giving a prisoner a power of appeal?—Certainly; I think it would be a great improvement to make them more rare, perhaps by adopting the system of councils of discipline, as they are called in the Belgian service. Men who do not commit crimes, but who are a bad lot, are not tried by a *conseil de guerre*, but they are sent before this council of discipline and punished by that. I think our courts-martial are rather too common.

The witness withdrew.

Adjourned to Thursday the 22nd inst. at 12 o'clock.

Room E., House of Lords.

Thursday, 23rd April 1868.

23 April 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEY.
LIEUT-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
MAJOR-GENERAL SIR ALFRED HASTINGS HORSFORD, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
COLONEL S. N. LOWDER, C.B.
CAPTAIN THE HON. J. C. W. VIVIAN.
SAMUEL WHITBREAD, ESQ.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

CAPTAIN LONSDALE AUGUSTUS HALE, R.E., called in and further examined.

1712. (*Chairman.*) Have you any remarks to offer to the Commission in addition to your former evidence?—There are one or two points to which I should like to refer. The last question but one, No. 1710, I did not understand rightly. The question was? "Instead of that second court-martial which "you have suggested, would it not be better to have "a regimental court-martial composed" in such and such a manner? I did not hear those words "instead "of that second court-martial," because I presume that second court-martial refers to the court of appeal which I suggested, and that would not be any substitute for it. What I intended to convey by my answer was, that it would be better to have a regimental court-martial constituted with officers of a higher rank than at present, but that it would be inconvenient to the service to have it so constituted.

1713. Have you any other suggestions to make in addition to those which you made in your former examination?—With regard to the mode of procedure of regimental courts-martial, the recording every question and recording every detail that happens creates a great deal of unnecessary writing. The president of a regimental court-martial is compelled to keep a journal of the proceedings in addition to noting down the evidence. I have drawn out here a simple case of habitual drunkenness; I have not put in any evidence at all, and I have drawn it out according to the Queen's Regulations on one side of the page, and I have drawn out on the other what I consider to be necessary; if there were certain precedents which every court must follow, and which the president at the end was bound to certify had been followed, a great deal of this record might be cut out. For instance the president has actually to write that the names of the president and the members of the court are severally read over to the prisoner, and that they severally answer to their names. If you are trying several prisoners I cannot see the use of writing that over and over again. Then again they must say that "sapper so-and-so "is brought a prisoner before the court." Of course he is, but I do not see any necessity for entering that on the record. The consequence of all this extra writing is that when you want to cross-examine the prisoner, the court do not quite like your putting a great many questions if they appear to be at all irrelevant, though not from any wish to prejudice the prisoner. I have myself when acting as prosecutor in rather a difficult case before a district court-martial been obliged to yield to the almost remonstrances of the president of the court, and not to press my questions, simply because he had to write down every one.

1714. You propose to omit any statement that the Order for convening the court is read, and that the names of the president and the members were read over, and you also propose to leave out this question: "Do you object to be tried by me as the president, "or by any other of the officers whose names you "have heard read over?" and you have put against that that the prisoner is merely called upon to say "Guilty" or "Not Guilty;" but surely that is a very great protection to a prisoner, is it not?—I would always have the question asked. If I may be allowed to refer to the French service there are certain points which must be followed in the French service, which are known and which must be attended to.

1715. And you would have it recorded that all those questions were asked?—Yes.

1716. (*Capt. Vivian.*) In one general question?—Yes.

1717. (*Mr. Mowbray.*) Is your objection to its being necessary that the questions should be asked, or to the time that it takes to record them?—The time that it takes to record them during the time that the trial is going on.

1718. Might not that be obviated by adopting at regimental courts-martial the system adopted at district and general courts-martial?—Quite so, but there is no regulation for that being adopted at regimental courts-martial.

1719. (*Chairman.*) Do you know why the president of a regimental court-martial is obliged under the present regulations to write down the answers in his own handwriting?—I do not know the reason for

Capt. L. A. Hale, R.E.

23 April 1868.

it. It need not be written in the president's handwriting, any member of the court may write it.

1720. (*Mr. Mowbray.*) You know that the adoption of printed forms at district and general courts-martial has been attended with great convenience as shortening the proceedings?—Yes.

1721. Do you know any reason why that system should not be adopted with regard to regimental courts-martial?—I do not.

1722. (*Lt.-Gen. Scarlett.*) Do you happen to know why at one time there was a very strict order that everything should be written in the same hand and to the full extent and with a certain form?—I can imagine what the reason would have been, but I do not know it.

1723. (*Mr. Headlam.*) I think I understood you to say that you had abstained from putting questions rather to save the trouble of the court in writing down such particular question?—Yes.

1724. Then the suggestion which you now make of printed forms would not obviate that?—Not in the least.

1725. But you would not go on to suggest that with regard to any such questions as those to which you have alluded, they should not be put down?—I would not have the questions written at all. I would merely have the answers written.

1726. Then how could the revising authority, whatever it might be, judge as to the propriety of the questions?—I should imagine that from its being put in the form of an answer he could tell whether the evidence was admissible or not.

1727. The effect would be, would it not, that it would quite preclude the possibility of forming any opinion as to the propriety of the manner or form in which the questions had been put?—Under the present system cross-examination is simply impossible.

1728. Why so?—You have to write your questions and you have to hand them in, and there is all that delay. You cannot press a witness at all. The particular case to which I have referred was a case of stealing gunpowder at Gibraltar. It was a district court-martial. I had very good reason to believe that the man was perjuring himself, and I was obliged to write down every question and hand it in.

1729. (*Lt.-Gen. Scarlett.*) But you are not obliged to write a question and hand it in in districts courts-martial?—It must have been a general court-martial then. It is some years ago. The question is written down by the president.

1730. But it is not written down on a piece of paper and handed in at district courts-martial?—No. But you have to dictate the question slowly to the president while he writes it down, and all this time the prisoner is preparing an answer.

1731. (*Mr. Headlam.*) That does not apply where a shorthand writer takes down the proceedings?—It does not.

1732. But when you say that cross-examination is precluded it merely means that there is a certain delay between the questions?—Exactly.

1733. But it is not precluded in any other sense than that there is such a delay between the questions?—No; there is the time between the questions, and I think that officers in asking the questions put longer questions than they otherwise would, and try to condense into a few questions what it would be desirable to put in many questions.

1734. (*Lt.-Gen. Eyre.*) I think that in your branch of the service you have very little opportunity of being practically acquainted with the duties of courts-martial?—As a rule we have not.

1735. Have you yourself been on many courts-martial?—I have been on very few.

1736. Then your suggestions and the knowledge which you possess are based on your having studied the subject, rather than upon your actual experience?—Yes, and upon conversations with other officers on on the subject.

1737. It is not from your own experience as a member of courts-martial?—I have not been on many courts-martial.

1738. (*Capt. Vivian.*) Do you not think that it would be difficult to convey to the person who had to decide afterwards upon whether a question was relevant or irrelevant, the relevancy of that question, unless the whole of the details of that question were before the person referred to, that is to say, the Judge Advocate, or whoever it might be?—I should have imagined not, by entering the answer very fully.

1739. But, for example, if a prisoner is examining a witness and he puts a question to which the court objects, according to your plan, if the question put before that had not been put down, surely whoever was to decide whether that question was relevant or irrelevant could not do so, because he would not know what the context was?—There might be some difficulties of that sort.

1740. (*Chairman.*) Will you proceed with any further remarks which you may have to make?—With regard to a point as to courts being censured by commanding officers, I have had no experience of that myself; but I have made it my business to ask officers about it, and so far as I can find out, it is a notorious fact in the service that commanding officers do censure courts in private. I have not the least objection to courts being censured if they are wrong, but what I object to is courts being censured in private by commanding officers, either for the sentences or for the verdict. If the court have given a wrong sentence, surely it is a matter for public censure, and not for private censure. Over and over again I have spoken to officers upon the subject, and they have one and all told me that they have been censured very strongly indeed by commanding officers, both for the verdicts and the sentences. Of course I have no means of judging who was right or who was wrong, but even if they were wrong I respectfully maintain that the independence of the courts, as courts of justice, is very much threatened by its being in the power of a commanding officer to send for a president or for the members in private and to censure them.

1741. But is it a real censure in a military point of view or it is merely an expression of the private opinion of the commanding officer that the court had erred in their judgment?—It has been expressed to me in such homely language, for instance, as this: "The commanding officer sent for me and pitched "into me tremendously for that verdict."

1742. (*Lieut.-Gen. Eyre.*) Have you heard of this as a common practice, because I have never heard of such a thing?—Yes, I have.

1743. Do you not think that you are mistaken as to the intention of the reprimand, as you call it; is it not probable that it was some particular conduct on the part of one of the officers complained of by the president without reference to the finding and sentence to the court?—I am merely mentioning the impression that was conveyed to me by the officers who have been reprimanded, and as I say their language to me was that they were "pitched into" by the commanding officer for not having found the man guilty. I myself have never come under that censure. With the greatest possible respect for the Commission, I beg distinctly to adhere to what I have stated; that it is an impression among the officers, to whom I have spoken, that they have been found fault with by commanding officers, whether rightly or wrongly I do not pretend to pass an opinion, but in private, for the sentences, or verdicts, they have given.

1744. (*Mr. Whitbread.*) Do you think that they will be willing to come and give evidence on that subject?—I dare say that they would not.

1745. (*Lieut.-Gen. Eyre.*) You do not know yourself of such being the case?—It has not happened to me.

1746. Can you quote an instance of it?—I do not wish to give the names of the officers.

1747. You have witnessed nothing of the kind yourself?—I have not.

1748. (*Chairman.*) Would it not be a military offence on the part of the commanding officer of a regiment to reprimand an officer of his regiment for the part he had taken in a court-martial?—Yes, but it would not be an offence to reprimand a court, or to find fault with a court openly.

1749. (*Maj.-Gen. Horsford.*) Openly, and on the documents themselves he may make his comments, showing wherein he disagreed with the court?—Yes, exactly.

1750. But in secret he cannot do it?—No.

1751. (*Lieut.-Gen. Peel.*) Would it not be open to an officer so reprimanded to complain of the conduct of his commanding officer?—Quite so.

1752. (*Chairman.*) Have you ever heard of an officer so treated by his commanding officer making a formal complaint?—No.

1753. (*Mr. Whitbread.*) This is not a mere matter of conversation, but you have heard this stated by officers who have been themselves subjected to this kind of private reprimand?—Yes.

1754. Upon what ground was this reprimand administered; was it for having awarded too light a sentence?—I think it was something of that sort, if I remember rightly.

1755. (*Mr. Mowbray.*) Does it ever go to the extent of finding fault with an acquittal as wrongful, and stating that there ought to have been a conviction?—I could not state that definitely.

1756. *Lt.-Gen. Scarlett.*) Would you propose to have a court of appeal?—I propose to have a court of appeal.

1757. (*Lt.-Gen. Eyre.*) Like the French?—Like the French.

1758. They have three courts of appeal, in fact, have they not?—No; one court of appeal only. There is a *Conseil de Revision.* There may be an appeal to the Civil Court possibly in some very special cases. There is one other point to which I should wish to refer with regard to the procedure of courts-martial, and that is with regard to the authorities which may be brought before courts-martial upon points of practice, and so forth. There is a very great diversity on such points. This does not apply of course to small courts, where a man is tried for habitual drunkenness, or any thing of that sort; but where an officer or a man is tried before a general court-martial. I have here one or two instances of this. At the trial of an officer in the 46th Regiment, about 10 years ago, or rather more, at the commencement of the Crimean War, that court stated that they only received the Mutiny Act as their authority. At a court-martial upon Lieutenant Hyder, of the 10th Hussars, about the year 1839, not only did they receive "Simmons on Courts-martial," but they received "Starkey on Evidence." At Douglas's court-martial in Guernsey, Simmons, the identical book which had been accepted before, was refused, and in that case Simmons being refused had a most injurious effect upon the prisoner's interest, because in Simmons there is a particular Horse Guards' Order which bore upon that case, and the only way apparently that the prisoner there had of bringing the Order at once before the court was to produce Simmons. They said "Simmons is no authority;" but Simmons does actually contain Horse Guards' authorities; and you cannot be sure of course when you go before a general court-martial whether the authority which you have relied upon will be accepted or not.

1759. (*Lt.-Gen. Scarlett.*) Would you not be obliged, in order to prove the Horse Guards' Order, to produce the Horse Guard's Order in a book not direct from the Horse Guards?—On points of practice I suppose that Simmons with some courts would be authoritative. There are many points of practice which are not laid down. It is received by some courts as authority.

1760. Do you consider that the courts are obliged to take this authority?—They are not.

1761. But you say that they do take it?—Some of them do.

1762. What would you suggest?—I would suggest that there are certain points in the procedure of courts-martial and so forth which are not exactly laid down in the Queen's Regulations. There are points which have been raised once or twice during general courts-martial. It is rather more a legal point than a matter of procedure, I presume, whether a witness for character may be cross examined. That point has been raised at two different courts-martial and decided in the same way. If those different points were laid down authoritatively in some short code, which could be laid before a court, I think it would be beneficial to the service.

Capt. L. A. Hale, R.E.

23 April 1868.

1763. (*Mr. Mowbray.*) Your objection points to the insufficiency of the military code and of military law as found in the Mutiny Act, the Articles of War, and the Queen's Regulations?—And Horse Guard's Orders, which we cannot get at, of course.

1764. But any treatise on military law would have no authority except such as it derived from the learning of the man who wrote it?—Exactly.

1765. It is the same as with a judge in a civil court. The law which he administers is the law of the land, the common law, the statutes, or the decisions of the judges, which carry authority with them; and any treatise, however learned, is merely an authority, which a counsel may cite or bring before them, but it is not conclusive?—No. There is one point illustrative of that which occurred in India in the year 1839. An officer who had voted for a prisoner being "Not guilty" declined to vote on the sentence. He said he did not think the man was guilty, and he would not vote for the sentence. He was tried by court-martial for refusing to vote on the sentence, and it had been laid down in London in 1834, by the Judge Advocate General (I do not know who was the gentleman occupying that position at that time) that an officer was bound to vote for the sentence, whether he voted for "Guilty" or "Not guilty." If that had been authoritatively put before the court in some short code that officer would never have been tried by court-martial; but it is nowhere laid down in the Queen's Regulations that an officer is to vote if he thinks a man "Not guilty."

1766. (*Mr. Whitbread.*) What you want is a short manual of decisions to guide the courts in future?—Yes; decisions, and remarks, and so forth.

1767. (*Mr. Headlam.*) Published by authority?—Published by authority.

1768. (*Mr. Mowbray.*) There is no doubt, is there, that military law is rather confused?—It is rather chaotic.

1769. And it is somewhat imperfect?—No doubt.

1770. But those deficiencies should rather be supplied by a code of military law emanating from authority than by authorizing courts to receive treatises, however valuable they may be, or however learned the people who write them?—Exactly so.

1771. (*Capt. Vivian.*) Do you not think it would be advisable that some public record should be kept of the reasons why the decisions of courts-martial are sometimes reversed?—Yes.

1772. That is to say, that occasionally it happens that a court finds a prisoner guilty, and sentences him to a certain punishment. That punishment is confirmed by the confirming officer, and then, after a time, one finds, somehow or another, that the whole of the proceedings of that court are quashed; but no one knows why—probably it is by something illegal which has taken place. Do you not think it would be advisable, as a guide for future courts-martial, that the reasons why the decisions of courts are reversed should be published in some way?—Certainly.

1773. It is the practice in civil courts. When there is an appeal to a higher court, that the reasons why the judges reverse the decision of the inferior court are given in open court, and this, if not written law, at all events guides future decisions; do you not think it would be advisable that it should be the same in courts-martial?—Very much so. That reminds me of one other point bearing on the same thing. There

Capt. L. A. Hale, R.E.

23 April 1868.

is a letter from the Judge Advocate General's office with regard to a court-martial upon a man in the 10th Hussars. It is there stated that the prisoner should be allowed as much licence of cross-examination as possible. I think it would be very beneficial if it were known throughout the service that such a decision had come from the Judge Advocate General's office. I only happened to have seen it because a friend showed it me; but if I were to act upon that, upon the next court-martial over which I were to preside, the court, of course, would say that they knew nothing about that letter.

1774. (*Chairman*). Is there any other point upon which you wish to make any observation?—Fault has been found with courts-martial for admitting irrelevant matter to a certain extent, which, of course, prolongs the proceedings. I should like to bring to the notice of the Commission a case which occurred in India, in which the court explained the length of their proceedings in a remark which appears to have passed without comment. They said "the peculiar "nature of the charge, involving as it did the character "of the prosecutor, no less than the conduct of the "prisoner, rendered it indispensably necessary that all "the circumstances bearing on the one or the other "should be fully inquired into, and hence the length to "which the proceedings extended." That, therefore, would be almost a justification to any court to go into almost any amount of irrelevant matter. I merely mention that as an illustration.

1775. Do you wish to offer any observations to the Commission with regard to military punishments?—I do not.

1776. Have you had any opportunities of judging of the effect of military punishments?—No, except that having been with sappers for the last 12 or 13 years, the punishment for habitual drunkenness by stoppage of pay seems to me to be quite useless. A man gets drunk whether he gets pay or not. If he is an habitual drunkard we cannot stop him from drinking, and I am afraid there are a good many of that sort of men.

1777. (*Lt.-Gen. Scarlett*). What punishment would you propose to inflict for habitual drunkenness?—I should like to get rid of the man after his second conviction for habitual drunkenness. I do not think a man would go and get habitually drunk on purpose to get his discharge.

1778. (*Chairman*). You do not agree with the evidence of a former witness that some of the drunkards are good soldiers in other respects?—I do not think we find it so in the engineers. They require so much looking after.

1779. (*Lt.-Gen. Eyre*). Do you think an habitual drunkard (taking the word "habitual" in a strict sense) an unfit man for a soldier?—I think he certainly is an unfit man.

1780. (*Chairman*). Have you any other suggestions to make to the Commission?—No.

Adjourned to Monday next at 12 o'clock.

Room E., House of Lords.

Monday, 27th April 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
MAJOR-GENERAL SIR ALFRED HASTINGS HORSFORD, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
CAPTAIN THE HON. J. C. W. VIVIAN.
COLONEL S. N. LOWDER, C.B.
SAMUEL WHITBREAD, ESQ.

JOHN LLOYD WHARTON, ESQ., *Secretary*.

Col. C. R. Egerton.

COLONEL C. R. EGERTON called in and examined.

1781. (*Chairman.*) You have brought some papers from the Horse Guards, have you not?—Yes, I have brought the proceedings of a court-martial on Serjeant Instructor Cox, of the Grenadier Guards, and all the correspondence on the subject which was called for by the Royal Commission.

1782. Do you hand them in simply, or are you directed to make any observations upon them?—I shall be glad to answer any questions which the Royal Commissioners may think fit to put upon them.

1783. (*Capt. Vivian.*) Have you brought every paper of every kind?—Every paper of every kind connected with that correspondence.

1784. Not the censure, I suppose?—Everything—every letter which has been written.

The witness withdrew.

Major-Gen. the Hon. J. Lindsay.

MAJOR-GENERAL THE HONOURABLE JAMES LINDSAY called in and examined.

1785. (*Chairman.*) I believe you, at the present time, hold the office of Inspector-General of the Reserve Forces?—I do.

1786. And that you have filled several important commands, both regimental and other?—I have.

1787. Has your attention been directed in particular to the constitution and practice of courts-martial?—It has, of course, come before me in the positions which I have held, both as commanding officer of a regiment, and as a general officer commanding a district.

1788. First of all with regard to the constitution of courts-martial, taking first general courts-martial; have you any suggestions to offer to the Commission?—Nothing in alteration of the principle, but some alteration of detail, I think might be made.

1789. What are these alterations which you would recommend?—For instance, in consequence of the appointment of this Commission, a question has been raised, namely, whether a soldier ought to have assistance (I am speaking of a soldier, not of an officer) before a general court-martial.

1790. Is it your opinion that a soldier ought to have more assistance than he has now?—I think he ought to have the option of having an officer to assist him if he wishes it.

1791. Would you confine his selection to an officer of the regiment to which he belongs?—To the regiment to which he belongs—I think that it might be left to the general officer commanding the district to appoint, if the man wishes one.

1792. Then, in recommending that a soldier shall

be able to choose an officer to assist him on his trial, you recommend that it should be open to the discretion of the commanding officer whether he shall be allowed to make that selection in or out of his regiment?—Yes; I would let the man choose for himself, but if he did not and the commanding officer thought it advisable that he should have an officer to help him, I would choose one for him.

1793. Would you allow the soldier himself to choose?—Yes, I would allow the man to choose whom he pleases in his own regiment, and if the commanding officer thought it advisable that he should have assistance, or if the general officer thought it advisable that he should have assistance, I would appoint an officer for the purpose.

1794. (*Maj.-Gen. Horsford.*) Even if he did not wish it?—Yes, even if he did not wish it, so that he should have no excuse for thinking that he had no one to assist him.

1795. (*Capt. Vivian.*) Should that officer read his defence?—If the soldier did not wish to read his own defence I would allow the officer to read it.

1796. (*Chairman.*) The prosecutor in a court-martial is, I believe, allowed to make a speech on the opening of the proceedings?—Yes.

1797. Would you allow the officer selected by the soldier the same privilege on his behalf?—I see nothing against it; I would allow it; I may add here that I have no faith in speeches generally. The court goes by what the evidence proves, and not much by statements in an address.

1798. Would you allow the officer so selected to cross-examine the witnesses on behalf of the prisoner?—I would not; I would pursue the same course as is at present adopted, except that I would have a short-hand writer in a general court-martial.

1799. In saying that you would pursue the same course as is now pursued would you still retain the necessity of every question being in writing?—I would have the questions put and taken down by the short-hand writer.

1800. But would you have the question, as is the case now, submitted to the president of the court-martial before it is put?—I would have it submitted to the president. The rule hitherto has been that a question once put is not erased.

1801. Are you speaking of cross-examination questions?—Yes.

1802. In cross-examination would you have every question submitted in writing?—I think that is the safest plan. I have myself been on two or three general courts-martial, and I have always found that the questions put are put down. In one or two instances only have I ever known a question which was wished to be put refused, and that was refused with the consent of the whole court, and not upon the dictum only of the president.

1803. Do you recollect upon what grounds it was refused?—As being irrelevant to the point at issue.

1804. Have you any suggestions to make with regard to the duties of the Deputy Judge Advocate on courts-martial?—No; I think that in the last regulations those duties are defined in a manner which I can hardly fancy it is possible to improve; they are thoroughly defined.

1805. Would you still retain it as a portion of the duty of the Deputy Judge Advocate to take the part of the prisoner, as is now his duty?—That perhaps would not be necessary if the prisoner had somebody to assist him, but at the same time, in the trial of a private soldier, points of law may arise which the officer who is assisting the soldier may not be conversant with. I think if the Deputy Judge Advocate exercises an influence in that way it would be beneficial to the soldier.

1806. With regard to the trials of officers in some of the foreign armies there is a double court; there is what is called a Court of Honour and a Court-martial; are you of opinion that it might be advisable, or the contrary, to establish courts of honour for the trial of officers for particular offences?—That virtually is what we have now. If an officer gets into an unfortunate position it is usual to order a court of inquiry to assemble first for the purpose of ascertaining whether there is sufficient ground to bring a charge against him.

1807. And you look upon the previous court of inquiry very much in the light of a court of honour?—Except that it has no power of decision.

1808. Have you any other suggestions to make with regard to the constitution or practice of courts-martial?—I think not.

1809. Is it your opinion that, generally speaking, in the British army there is on the part of the soldiers, for instance, confidence in the justice administered under the present system of courts-martial?—I am perfectly confident that there is that confidence on the part of the soldier.

1810. Have you, either officially or otherwise, had cognizance of any serious complaints of want of proper administration of justice from either soldiers or officers?—I have not. From experience I am perfectly convinced that there is no feeling on the part of the soldiers that the regimental courts-martial are not properly and fairly conducted; and, with regard to those of a superior character, they know perfectly well that they come under the revision of an impartial person, who has no object whatever, except to do justice, namely, the general officer in charge of the garrison or the district.

1811. Do you believe that it is the habit in any of the regiments in the British service for the commanding officer to express an opinion to his officers in private as to their conduct upon courts-martial?—It is impossible to say that that has not occurred, and in all probability it is a thing which has occurred; but I should say that it was excessively rare, and perfectly exceptional. I do not think that any man of any position would do such a thing. Afterwards an officer may try to influence in the way of revision by expressing his opinion, but that expression of opinion is part of the proceedings and most unquestionably should not he done *vivâ voce*.

1812. Do you think that any commanding officer who should animadvert upon his officer's conduct in courts-martial would be subject to grave censure in the Horse Guards?—I think that he would. I may add that, with regard to crimes that come before regimental courts-martial, usually they are of a remarkably simple character, so simple that, unless the man was certain to be convicted, he would not be brought to the court-martial at all. I may mention habitual drunkenness, absence, overt acts of improper conduct; they are all simple crimes which are very numerous, but they are so simple that, if they were not facts in themselves, the men would hardly be brought before the courts-martial at all.

1813. (*Maj.-Gen. Horsford.*) They generally plead guilty, do they not?—They generally plead guilty. The custom is, that a soldier before a regimental or a district court-martial has nobody to assist him.

1814. (*Lt.-Gen. Peel.*) But there is nothing to prevent it at this moment?—No.

1815. Nothing to prevent his defence being read for him?—No.

1816. All that you recommend is that it should be made compulsory upon the officer to do so?—Yes.

1817. (*Mr. Whitbread.*) Do you express any opinion about the power of a confirming officer to send back the finding of a court-martial for revision; do you think it likely to inspire the soldier with a feeling of confidence in the justice of a tribunal if the confirming officer sends back the decision of the court with the view, and the avowed view, of getting a severer sentence for him?—That entirely depends upon circumstances. I can tell you two instances in which I have done it myself within the last two or three months. First of all, I would say that it is perfectly necessary whenever such a thing is done that full explanation should appear upon the body of the proceedings, of why you do it. The circumstance that occurred was this:—A man was

Major-Gen. the Hon. J. Lindsay.

27 April 1868.

tried before a district court-martial for first desertion. Desertion, I am sorry to say, is not considered a very serious crime by the men, and the usual punishment for a man on his first desertion is generally light. The man was tried for desertion, making away with necessaries, and there was a third charge for fraudulent enlistment in another regiment.

1818. (*Lt.-Gen. Peel.*) Was that fraudulent enlistment subsequent to the desertion?—During his desertion. The punishment that he received was 56 days imprisonment with hard labour, which is the usual punishment which a man gets upon his first desertion. I sent that court-martial back for revision, stating upon the face of it that desertion was a very serious crime, that the man had received only the usual punishment given for a simple act of desertion, with making away with necessaries; and that fraudulent enlistment was cheating the public and a disgraceful act in itself; and, therefore, that I thought the man was worthy of a heavier punishment than the 56 days. The Court revised their sentence, and gave him 84 days. The whole of those proceedings were read out to the men, and I conclude that there was not a man who heard them that did not agree with the justice of what I had said. All the regimental courts-martial come before the general officer every month, in the courts-martial returns, which are very closely looked at; and where a court is revised it is recorded. Sometimes I have interfered in regimental courts-martial, and something being, as I thought, irregular; I have sent for the court-martial itself from the regiment, and read it, and I have ordered a man to be released. The whole of that is in the power of a general officer commanding a district.

1819. (*Lieut.-Gen. Scarlett.*) It has occurred to you that regimental courts-martial have come under your notice which have been re-assembled by the confirming officer for the purpose of inflicting a more severe punishment, and you have thought it necessary to interfere?—I have.

1820. (*Mr. Whitbread.*) Do you not think that on the whole it would be a better plan to limit the power of any authority higher than the court-martial to mitigation of sentence?—I do not think so. The opinion I have formed from my experience of officers is that they are very independent. It has occurred to myself, when I have revised a court-martial, that the officers have adhered to their decision.

1821. Do you think that is for the benefit of the service, and does it tend to maintain discipline in a regiment, when a commanding officer sends back a court-martial for revision, and the Court adhere to their sentence?—The general officer would then say, "confirmed" or "confirmed but disapproved," and state his reasons. I have never found that in any way discipline has been in the least relaxed by it.

1822. (*Lt.-Gen. Eyre.*) Or he might not confirm or approve, and so the man remains unpunished?—Yes, where it is a slight case I have known such an instance as "not confirmed" and "sentence remitted."

1823. (*Mr. Whitbread.*) But the power of this revision is founded, is it not, upon the assumption that the regimental court-martial is not a body fit, finally, to pronounce a sentence?—You must have some superior authority; you must always have some court of appeal. There was one point in the questions that the Chairman asked me some time ago, to which I should like to recur again. I think it would be a very good thing if there was an appeal for the private soldier from a regimental to a district court-martial.

1824. (*Lt.-Gen. Scarlett.*) Has he not that privilege now?—No; he has an appeal to the General, unless it is altered this year.

1825. (*Mr. Mowbray.*) Have you had your attention much called to cases of embezzlement?—Yes; I have had a great number of cases of embezzlement in Canada.

1826. Do you not think a court-martial is a very bad tribunal for trying such cases?—I am glad I have been asked that question, because I have a strong view as to the management of those cases. My own opinion is that those cases, where they occur within a barrack, ought to be tried by a court-martial; but they are often difficult cases that require assistance. I would extend the position of the Deputy Judge Advocate to cases of that sort. They are cases which are very intricate. They are generally cases in which you have no direct evidence, and in which the evidence is presumptive, and I think that courts-martial, that try men for stealing and other disgraceful conduct, ought to have a Deputy Judge Advocate to attend them.

1827. They are intricate as to facts?—They are intricate as to facts, and very often they fall to the ground, either from want of care, or from ignorance upon the part of the prosecutor.

1828. There is great difficulty of legal proof, and there probably would be great difficulty in proving the case in an ordinary court of criminal jurisdiction?—There is always a difficulty, no doubt.

1829. And they are not specially military offences, except that they are committed by persons who are subject to the Mutiny Act?—I suppose you would call that more a civil than a military offence; but still, I think, those crimes committed in military society ought to be tried by their own officers; and with the assistance of the Deputy Judge Advocate you would have what you want.

1830. Do you not think that, in nine cases out of ten, those cases fail for want of legal proof?—They fail for want of legal proof; but, I think, they fail generally, because officers do not readily take presumptive evidence. They are more accustomed to direct evidence, and they often shrink from taking presumptive evidence. My own opinion is that these courts-martial are too favourable to the prisoner, and that the man frequently improperly gets off, and justice is not done on that account.

1831. Those cases frequently involve imprisonment, and a large sum awarded for stoppages, do they not?—Yes.

1832. Are you not aware that the Judge Advocate-General is often obliged to set aside some of those sentences of stoppages for want of legal proof?—I suppose the imprisonment is set aside at the same time.

1833. Not necessarily?—That has not come before me.

1834. But you would prefer having those cases tried by a military tribunal to handing them over to the civil authorities?—I should.

1835. (*Capt. Vivian.*) With regard to the composition of general courts-martial at present in England, they are composed of nine members, are they not?—They are by the new regulation.

1836. Do you think they might satisfactorily be still more reduced?—I do not think so. I think a general court-martial ought to be a very exceptional thing indeed; and, therefore, to reduce it below nine in number, I think, would rather deteriorate the character of the court.

1837. In some of our colonies it is now seven, is it not?—Yes, but that is an exception.

1838. I think a general court-martial which was assembled in the West Indies lately was composed of seven?—I think it was either seven or five.

1839. (*Chairman.*) But that was from the necessity of the case, was it not?—That was because there were very few officers there.

1840. (*Capt. Vivian.*) You have said that you would advise that a soldier should have an officer in his own regiment to assist him before a general court-martial. Why do you limit his choice to an officer in his own regiment, supposing he was in garrison and wished to have an officer of another regiment?—I do not see why he should not have him.

1841. Then you say that the officer should be allowed to read the prisoner's defence, but he should not be allowed to help him in his cross-examination. Why did you make that distinction?—The system of cross-examination leads to a great number of ques-

tions which are perfectly useless, as I have often observed in court; and if each question is written down, I think people would take very great care what they asked, and would have it more completely to the point than if they did it *vivâ voce*. The voice often carries a man away with it.

1842. But I am speaking now of the assistance of the officer, the assistant himself, or the soldier putting questions in cross-examination written or *vivâ voce*?—Practically the soldier does not do it. The question is usually made out for him; it is read before the president, and the Deputy Judge-Advocate puts it to the witness.

1843. You made a distinction in your evidence, and said that you would allow the officer to read the soldier's defence for him, but that you would not allow the officer to cross-examine the witness; upon what grounds did you make that distinction between cross-examination and reading the defence?—Simply that when a man is cross-examining his tongue runs away with him to a certain extent, and I think the thing would be better done by the questions being put by the president and the Deputy Judge-Advocate seeing that the question is to the point.

1844. But would not an officer who would bring an intelligent mind to bear upon the subject, be more likely to confine himself strictly to the question before the court than a soldier who, probably not having such a high education, would be more rambling in his questions, as people of inferior education naturally would be?—As the question is put in writing you escape that.

1845. With regard to the questions in the cross-examination, you know quite well that if you are cross-examining an equivocating witness, or a witness who is suspected of equivocating, if you ask him questions directly you are more likely to press him upon a point than if you give him an opportunity of considering all his answers during the time that the questions are being written down?—No doubt that is a point.

1846. As you recommend that an officer should be permitted to assist a soldier, and as you have also recommended that a short-hand writer should take down the proceedings of general courts-martial, do you see any objection to the questions in cross-examination being put *vivâ voce* instead of being put in writing through the president?—My impression is that it would be better done by its being in writing, because I have very often observed the extreme difficulty there is in stopping irrelevant cross-examination. Persons cross-examining often try to browbeat; they frequently ask questions of which you do not know the drift, and very likely you have to ask them what their drift is before you allow the question to go on; and I think there would be more care and decision if the question were put deliberately in writing than if a rapid sharp cross-examination is conducted.

1847. But then would not the president always have the opportunity equally of stopping a question which he thought irrelevant, although it was put *vivâ voce*, just as a judge now in a civil court stops any questions which in his opinion are illegal or improper?—It is very rarely that a judge interferes with counsel unless for something extremely irregular.

1848. At all events he has the power of doing so?—He has the power, and so would the president.

1849. So would also the president have the power, if the questions were put *vivâ voce*, of stopping the questions which he did not consider to be relevant?—He would have that power.

1850. You do not see any great objection then, supposing the system were altered and the questions were put *vivâ voce* instead of in writing?—So long as it is confined to an officer doing it and is not done by a legal man, I do not see any very strong objection. At the same time I still hold that the thing would be better done, though, no doubt, done slower by the old system.

1851. With regard to those matters of embezzlement, they are almost always very intricate cases; since you would still confine them to courts-martial, if charges of that nature are still to be dealt with by courts-martial, do you not think that in those exceptional cases it would be well to give a soldier the benefit of legal advice?—There is nothing against the soldier having legal advice.

1852. But if you gave him legal advice would you then allow the lawyer to read his defence?—No; I would keep it strictly to the officer; but I see no reason why, even if he employs a lawyer, there should not be an officer also with him.

1853. Then in that case you would let him have two assistants; the military man to represent him before the court, and the lawyer to watch the case for him?—Yes.

1854. (*Lt.-Gen. Scarlett.*) The answers you have given have been generally relating to general courts-martial for the trial of privates, have they not?—Yes.

1855. But upon district courts-martial and regimental courts-martial a private has a perfect right to cross-examining *vivâ voce*, has he not?—Certainly.

1856. And there is no difficulty in district courts-martial and regimental courts-martial in the *vivâ voce* examination?—None whatever; and if he wishes to have the assistance of an officer there is no reason whatever why he should not have it.

1857. I think you said that a private is very seldom brought to a regimental court-martial without such proof of his guilt that he is sure to be convicted?—Yes.

1858. Then what is the object of the court-martial, the man's guilt being pretty evident?—That brings on a question upon which I hold a very strong opinion. I should like to have the power of the commanding officers considerably extended. They are officers of a certain age and service, and I can see no reason why they should not have the powers of a magistrate, or that they should be intrusted with functions of that description. I would give them increased powers; I would give them the power of placing a man in the cells for 28 days; I would give them greater powers of fining as to drunkenness, and I would increase the power of a regimental court-martial to imprisonment for 56 days, which would be the commanding officer's resort when it was an offence not requiring a district court-martial, but somewhat more than he could himself meet. For instance, absence is a considerable crime in the army, in fact, absence and drunkenness are almost the chief crimes; and I can see no reason why the commanding officer should not punish a soldier to a greater extent, than he can now for absence by placing him in the cells.

1859. (*Capt. Vivian.*) To what is his power confined now?—To seven days.

1860. (*Maj.-Gen. Horsford.*) Would you give the man the power of appeal?—Certainly.

1861. (*Lt.-Gen. Scarlett.*) Would you allow the commanding officer to take evidence upon oath as a magistrate does?—Certainly.

1862. Then what in fact is the use of a regimental court-martial?—A regimental court-martial keeps a certain set of crimes within the regiment itself; crimes of ordinary character. It is composed of a fewer number of members, and therefore it is more easily arranged and settled; but of course the distric court-martial could take cognizance of every crime that the regimental court-martial does.

1863. Do you think that the court acts as a protection to the culprit against any partiality on the part of the commanding officer. A commanding officer may inflict a certain punishment, but he cannot inflict beyond a certain punishment without a trial by a regimental court-martial; therefore it protects to a certain extent the man from the punishment which might be inflicted upon him, but the court-martial may give less punishment than the commanding officer would give?—When the court-martial gives a punishment it may be lesser in period than the commanding officer can give; but the punishment of the court-martial carries with it a loss of service and loss of pay.

Major-Gen. the Hon. J. Lindsay.

27 April 1868.

1864. (*Lt.-Gen. Eyre.*) If you give more power to the regimental court-martial as you propose, would you improve the present constitution of those courts, or would you leave them exactly as they are in that respect?—I do not see how you could improve them; I think they work very well.

1865. Would you change the constitution of the court?—I think not.

1866. You have said that you would get more power; do you mean that you would keep the constitution the same as it is now, or that would you change it to a higher class of officers?—I would leave them the same, unless military authorities or the Royal Commission should think that two descriptions of courts-martial were enough; but a district court-martial conveys its meaning by its own name, it is assembled from different regiments. To increase the district court-martial I think would be rather an evil.

1867. (*Mr. Mowbray.*) Supposing that you increase the power of the commanding officer to give 28 days' imprisonment, and he thought 28 days was not enough in a particular case, and remitted the case to a court-martial with a view that they should give 56; and if then that court-martial gave a sentence of 28 days, would you still allow the commanding officer to remit it to the court-martial, and call upon them to revise it with a view to their giving a higher sentence?—I should always retain the power of revision. It would be perfectly competent to the officers respectfully to adhere to their former sentence. A commanding officer has the power of ordering a man seven days' imprisonment; it is not so likely as the case you put; but still I have known regimental courts-martial award that sentence. I maintain that whenever revision takes place explanation accompanies the revision.

1868. (*Lt.-Gen. Peel.*) I understood you to say that a question once put in cross-examination could not be retracted?—I do not mean to say that it could not be retracted, but it is not usual.

1869. Supposing the officer who was to assist the prisoner, and who (as proposed by Captain Vivian) was to conduct the cross-examination *vivâ voce*, did not know the circumstances of the case, he might put a question to the witness which would be very detrimental to the prisoner he was defending, might he not?—He might, certainly; but he ought to get up the case.

1870. Then the prisoner must tell the officer everything, in fact, plead guilty to him?—I should put the officer in communication with the man, and let them do the best they can.

1871. (*Mr. Headlam.*) I understand you to say that the present system gives satisfaction to the privates of the army, speaking generally?—My own impression is that the privates of the army are satisfied, and have no feelings that the courts-martial do not do them full justice; but at the same time there is a feeling abroad, no doubt, that the men should have assistance, and I think that would be a very good way of giving it them.

1872. You would increase rather the summary power of the commanding officer of the regiment?—I would.

1873. Do you think that would not create jealousy in cases where it was supposed that the commanding officer was an arbitrary man?—The power of imprisonment, which is what I alluded to, is accompanied by the power of appeal. If you sentence a man to seven days' cells, he can appeal at once to a regimental court-martial.

1874. You would suggest that from any summary decision of the commanding officer of the regiment he should, if he wished it, be at liberty to request that a court-martial should be summoned upon it?—Yes, he has that power now.

1875. It is never exercised, is it?—I have known it exercised. I have known an appeal from the decision of a commanding officer to that of a regimental court-martial, but of course it is only done when a man's pay is stopped.

1876. (*Lt.-Gen. Eyre.*) Did I understand rightly that you wished to assimilate commanding officers to civil magistrates?—I would give them the powers.

1877. To act as a magistrate?—Yes, it comes to the same thing. I think that the Commission have before them now the proceedings of a committee of which I was chairman, which was to give the power of stopping soldiers' pay for acts of drunkenness, and of fining them.

1878. (*Mr. Headlam.*) With respect to larger crimes you are aware probably that not unfrequently the proceedings of courts-martial before which officers have been tried have not been confirmed, would you suggest any alteration in the mode of proceeding in those more important cases?—I cannot. I think that they get full justice.

1879. You would not wish the mode of trial to be more assimilated to ordinary legal proceedings?—I would not; I would rather keep it as it is.

1880. You would not wish the court to be more under the influence of any legal officer?—I would not. I think that it would be more satisfactory both to officers and soldiers that it should not be so. They should have legal assistance; and I believe both officers and soldiers should feel perfect confidence that they are treated by a body of men who will do them justice.

1881. But does it not happen very frequently that the cases break down?—They do; but I would rather they broke down than that the system was altered. They only break down occasionally.

1882. Is there not an evil if you allow legal assistance on both sides in the absence of legal power in the tribunal to control the legal gentlemen who interfere in the conduct of the case, and in the fact that the court has to decide upon the argument of legal men without being itself conversant with legal decisions and legal practice?—I do not think there is. I cannot deny for a moment that there may be legal questions put forward in a legal shape which may puzzle the court, but that equally applies to jurymen, and it applies to committees of the House of Commons in the same way.

1883. In the case of jurymen, do they not get assistance from the judge?—Yes; but then you have a trained officer, as you may call the Deputy Judge Advocate. It appears to me that, so far as I have seen failures in courts-martial, they have generally arisen from the officers not quite understanding the rules of evidence; and if you have by you a person educated in the way in which the Deputy Judge Advocates now are supposed to be educated and trained, you have somebody to keep the court in order with regard to the evidence.

1884. Do you think that the system of the administration of military justice has been improved by the appointment of Deputy Judge Advocates?—I think so, certainly.

1885. (*Lt.-Gen. Eyre.*) If civil practitioners were introduced as part of the system, do you or do you not think that it would create a great deal of jealousy on the part of officers of the army?—I think it would be very unpalatable indeed.

The witness withdrew.

Col. E. R. Jeffreys, C.B.

Colonel E. R. Jeffreys, C.B., called in and examined.

1886. (*Chairman.*) You, I believe, command the depôt battalion at Parkhurst in the Isle of Wight?—I do.

1887. How long have you been in command there?—Upwards of 13 years.

1888. What commands have you held besides that?—I never was more than a brevet lieutenant-colonel in the 88th regiment, my own regiment. I commanded it from period to period when the colonel was away. I was a major 12 years in it.

Col. E. R. Jeffreys, C.B.

27 April 1868.

1889. In the course of your service have you had much to do with courts-martial?—Yes, I have, unfortunately, seen a good deal of them.

1890. Have you any suggestions to make with regard to the present system of courts-martial?—If commanding officers were given extra power as to imprisonment, with the right of appeal, I think that a regimental court-martial would be of no use.

1891. What system would you recommend?—I would give the commanding officer more power and do away with regimental courts-martial.

1892. (*Lieut.-Gen. Peel.*) Then that would abolish the power of a soldier to appeal, would it not?—He would appeal to a district court-martial.

1893. (*Chairman.*) Would you give a soldier the power in all cases to appeal from his commanding officer to a court-martial?—Only in cases where he has it now, of imprisonment or stoppage of pay. By the Articles of War now, if I stop a man's pay for two days he can appeal, or if I award him cells he can appeal; but he has no power of appeal from 14 days' confinement to barracks, and I would not give him that power of appeal; but I would increase the power of the commanding officer as to the period of imprisonment, and I would give him power to punish by a pecuniary fine for drunkenness, and I would certainly considerably modify the regulations with regard to habitual drunkenness.

1894. In what way would you do that?—I would not make it compulsory upon the commanding officer to try a man the fourth time.

1895. You would leave it open to his discretion?—I would leave it open to his discretion.

1896. Would you place no limit upon that discretion?—I would not let him go beyond, say eight times; but I have had many instances lately at Parkhurst of young soldiers being tried by a court-martial, which is a record against them for the whole of their service for habitual drunkenness, perhaps with only seven or eight months' service; and I think it is a pity to damn a man's character with a record of that sort.

1897. You do not think that being tried by a court-martial has any great effect in the prevention of drunkenness?—I am afraid that it does not prevent a great deal of drunkenness, but that it causes a great deal of absence.

1898. Do men rather than appear in a drunken state absent themselves?—Frequently a man tells me when I ask him after I have heard the evidence what he has to say, "Oh! Sir, I got drunk, and I thought "it best not to come in until I was sober."

1899. (*Maj.-Gen. Horsford.*) Do you know any reason for their being tried the fourth time?—I only know it from hearsay. I believe that the order was issued in consequence of some colonels doing it and others not doing it, and the consequence was that some regiments had a larger number of courts-martial; and when those colonels were remonstrated with for the numerous courts-martial they had in their regiments they replied, "So-and-so would have had an "equal number if he had tried for four times as much "as I have." I fancy that that was the origin of it.

1900. (*Chairman.*) Have you any suggestions to make with regard to the constitution of the court?—I think that a district court-martial of a field officer or a captain of experience as president and four officers, would be quite sufficient; and I would leave a general court-martial with nine members, as at present; I think it is a more formal serious court.

1901. At the same time a district court martial has to try very serious charges, has it not?—As a general rule I think not. If the charge is very grave the general officer remits it to a general court-martial.

1902. With regard to the mode of taking evidence in a court, would you preserve it as it now is?—No.

1903. What alteration would you suggest?—I would not write down a single question.

1904. How would you have the questions recorded?—Judging from the newspapers I do not see the questions written down in a civil court, but I see the answers written down.

1905. But courts-martial are different in this respect; that in the one case you can afford to have a short-hand writer, and in the other it would be found too expensive a process, would you pursue the same system under both circumstances?—Generally speaking, I think that it is unnecessary to put down the questions from the court, or from the prosecutor.

1906. (*Mr. Headlam.*) Are those the formal questions to which you are alluding?—Yes, the formal questions from the court or the prosecutor.

1907. (*Chairman.*) What would you substitute for them?—I would substitute the prisoner's answers. For example, "Have you any person to call for your defence," I would simply write down the prisoner's answer, "I have no one to call in my defence; I do "not wish to cross-examine that witness," what is the use of writing down "Do you wish to cross-"examine that evidence?"?

1908. (*Lt.-Gen. Scarlett.*) You mean that it would shorten the proceedings?—It would shorten the proceedings.

1909. Would you omit any questions put to a witness?—Yes, I would put down the witness's statement without the question.

1910. (*Mr. Headlam.*) You would not in any case put down any single question that was put?—No, I would put it just exactly as I see it in all the legal cases. I do not know whether they are proper reports which I read in the "Times" and elsewhere, but the answer is put down, and we know that that answer is worded by the writer of the report in reference to the lawyer's question.

1911. (*Lt.-Gen. Scarlett.*) But as this court is subject to revision, how would the revising officer in that case know whether those questions had been properly put, and whether the evidence was properly elicited by the questions?—I should think he would gather from the answers whether there had been anything improper asked.

1912. (*Chairman.*) A previous witness has given it as his opinion that for the present system, there might be substituted a statement that all the regular formal questions in the report of the court-martial had been asked and answered, do you think that that would be sufficient?—It would be quite sufficient as to the formal questions; but I consider that the six questions on pages 337 and 338 after conviction might be embodied in one.

1913. (*Mr. Mowbray.*) The questions being all in print, recording the answers takes a very short time, does it not?—Yes. In regimental courts-martial I have not employed the printed forms.

1914. (*Chairman.*) Why is that?—Because it would make the documents so voluminous. I think that anybody who sees the proceedings of a court-martial now will say that the Judge Advocate-General's office must be filled in a very short time. If I had all those separate pages in the regimental courts-martial the books of the regiment would not hold them; consequently I have my regimental courts-martial written out, and for that reason I wish to obviate all those superfluous questions.

1915. But you would ask all the questions, would you not?—I would ask them in one simple form.

1916. For instance, how would you put the questions recorded at page 337? "Are there any previous "convictions against the prisoner? What is his "general character, age, and service?"?—I would put that in one question, and of course in his general character the evidence would be given, "It is good. "He has two good-conduct badges and a medal," or "It is bad," or "indifferent," as the case may be.

1917. Is there any other mode of abbreviating the proceedings of a court-martial which you would recommend?—No.

1918. With regard to the finding of the court and the confirming of it, have you anything to suggest?—No; that has been abbreviated by the lately introduced printed form.

Col. E. R. Jeffreys, C.B.

27 April 1868.

1919. It has been objected to the proceedings of courts-martial that the highest authority should have the power of ordering a court-martial to reconsider its sentence with a view to a greater punishment. Is it your opinion that it is necessary to retain that power?—I think it is.

1920. Have you known many instances in which it has been exercised?—A few.

1921. Could you state the circumstances under which it has been exercised which you think form a reason for continuing it?—It was exercised a very short time ago in the case of a soldier tried by a district court-martial and convicted of desertion and fraudulent enlistment. The revising officer, the lieutenant-general commanding the district, considered that as the court had lost sight of the fact of the two offences, and had only sentenced the man to the punishment to which they would have sentenced him for a simple act of desertion, sent back the sentence, and on revision they increased the punishment.

1922. Is that the case which was referred to just now by General Lindsay?—No, it is another; it was in my district. Sir George Buller revised the court. The court had lost sight (and I am sorry to say sometimes, in the hurry of their proceedings, they do lose sight) of the gravity of the offence.

1923. (*Capt. Vivian.*) Do you say, advisedly, that in the hurry of their proceedings they lost sight of it, do you think that the proceedings of courts-martial are hurried?—I think that sometimes they do not sufficiently digest the thing in all its bearings; and then it is the duty of the revising officer to tell them them so.

1924. It is a field officer who presides over a district court-martial, is it not?—Not always; you cannot always get them. It is a field officer, or a captain of long standing in the service.

1925. But in the case of a district courts-martial at home it is an exception when you have any but a field officer presiding, is it not?—It so happens that at Parkhurst I have only one major, and it is not deemed expedient always to send a field officer over from Portsmouth to attend a district court-martial. Two or three senior captains of the depôt battalion are generally selected to sit as presidents of the courts-martial in turn with the major.

1926. (*Chairman.*) What length of service is required on the part of a captain to enable him to take the chair at a court-martial?—There is no regulation laid down for it; but no commanding officer appoints a captain unless he is of considerable standing in the service.

1927. (*Capt. Vivian.*) Does it specify in the regulations what the rank of the presiding officer of a district court-martial is to be?—I think it says that he is not to be under the rank of captain.

1928. (*Lt.-Gen. Scarlett.*) Have you any proposal to make for improving the mode of appointing the presidents of courts which is done now by roster; do you think that anything like a permanent court with a permanent president would be a useful institution?—I doubt it.

1929. (*Chairman.*) Do you think it is advisable that the officers of the army should be instructed in the law of courts-martial more than they are at present?—I am disposed to avoid law as much as possible, and to stick to plain sense.

1930. (*Capt. Vivian.*) But in embezzlement cases can you stick to plain sense alone?—There are difficult cases, but I would remit those difficult cases to the civil power. For instance, I would remit cases of embezzlement to the civil power.

1931. (*Chairman.*) What are the powers at present of commanding officers as to the remittance of cases to the civil power?—He is not under any obligation to remit cases unless the offence is committed out of barracks; but I have had cases of theft which I knew I could not have proved, or which at least I believed that I never could have proved before a court-martial, and I have sent them to the civil court, and the civil court have made the case as simple as possible and have convicted the men.

1932. How have you got them before the civil court?—I have informed the chief constable of the county that a robbery has been committed by a soldier in the barracks; he has come up and inquired into it, and he has taken the soldier.

1933. Then you do not require any additional powers to send them before the civil power?—No. It is the custom when an offence of that species is committed within the barracks to try it by court-martial under the Articles of War.

1934. (*Lt.-Gen. Peel.*) Could the civil power refuse to act in such a case?—I apprehend not.

1935. The expense of the prosecution would fall upon the county, would it not?—It would.

1936. (*Mr. Headlam.*) Do you think it easier to conduct such cases before civil tribunals than before military tribunals?—In many cases which have come before me I have said to the inspector of police, "I am sure that is a case I never could have esta-"blished;" and he has said, "Oh! Sir, the case is "quite simple," and the man has gone to Winchester. The man has been in fact tried and convicted by the civil power.

1937. (*Lt.-Gen. Scarlett.*) In case of theft?—Yes.

1938. From a comrade?—It was a complication of offences.

1939. (*Mr. Headlam*). Was he tried by a judge and jury, or was he summarily convicted?—He was tried by a judge and jury.

1940. (*Lt.-Gen. Peel.*) After his sentence is over, does he come back to the regiment?—He does.

1941. Is that sentence recorded against him just the same as that of a court-martial?—Yes, it is provided for by the Articles of War.

1942. (*Capt. Vivian.*) Then you recommend that all cases which are not in direct connexion with military affairs should be transferred to a civil court, such as embezzlement, theft, and things of that kind?—I do.

1943. (*Chairman.*) Is it your opinion that a greater power should be given to commanding officers to refer those cases to the civil power, or that it should be incumbent upon him in all cases to do so?—I think that his discretion should not be limited. He might try them by court-martial, or remit them to the civil power, according to his discretion.

1944. (*Lt.-Gen. Scarlett.*) That is the case now, is it not?—He has the power, but if it is frequently done it is questioned. I believe that it is preferred by the military authorities that a man should be tried by court-martial for an offence committed within barracks.

1945. (*Chairman.*) It does not signify as regards expense by which tribunal the man is tried, inasmuch as the public pays for it whether it is tried by a civil court or by a court-martial?—Exactly.

1946. You are aware that corporal punishment has been done away with in the army?—Yes.

1947. Do you think that it will be necessary to institute any other summary punishment to take the place of corporal punishment?—I do not know of any.

1948. Have you had many corporal punishments at Parkhurst?—No, I am happy to say very few indeed.

1949. How many have you had during the time that you have been there?—About six or seven in the 13 years that I have been there.

1950. (*Lt.-Gen. Peel.*) What kind of cases were they?—Grave cases of insubordination.

1951. (*Chairman.*) What punishment do you consider after corporal punishment to be the one which the soldier dreads the most?—I think he dislikes solitary confinement.

1952. More than shot-drill, for instance?—I think shot-drill is a mistake. It harasses and disgusts the man I admit, but I think that he may do work more profitable to the country and to himself, and I do not see the advantage of disgusting him.

1953. But is it not an object to have some punishment which the soldier feels very severely?—Yes, but there is something so peculiarly irritating in the shot-drill that I have always been adverse to it.

1954. What punishment can you substitute which would be at the same time beneficial to the country, and still be of that penal kind that would tend to prevent crime?—Breaking stones to a much larger extent than they do for repairing all the barrack yards.

1955. Is that thought so very severe a punishment?—It is not the actual punishment, it is the confinement and the restraint which they feel most.

1956. But in a case of insubordination do you think that would be sufficient?—I apprehend that in cases of insubordination in a prison the power of inflicting corporal punishment is not removed. No court-martial has the power of inflicting it, but I apprehend that the powers given to the visitors of a prison are not interfered with by that revised clause of the Mutiny Act. If they are it is a very grave affair.

1957. But do you apprehend that in a military prison it is in the power of any one now to inflict corporal punishment? — Certainly, by a board of visitors, for offences committed within the prison by a prisoner.

1958. Do you think that any of those punishments to which you have just alluded would be dreaded as much by the soldier as corporal punishment?—Corporal punishment was so very seldom inflicted that I doubt very much whether the fear of it had any deterrent effect; it was so exceptional.

1959. Then I understand you to say that you have no suggestions to make with regard to an alteration in military punishment consequent upon the abolition of corporal punishment?—No.

1960. You think that the discipline of the army may be maintained without any such alteration?—I think that the discipline of the army may be maintained, provided commanding officers have authority or encouragement to discharge really bad characters from the army.

1961. You recommend that that power should be given to the commanding officer under what limitations?—I would not give the power to the commanding officer, but I think that the recommendations of the commanding officer should be more listened to than they have hitherto been.

1962. You do not think that that would lead to the commission of crime with a view to getting out of the army?—It might do so in some cases, but a commanding officer can always see that himself and turn the soldier's flank.

1963. But at the same time in a case of that kind it would be advisable to have some very severe punishment, would it not?—There is the power of shutting the man up for two years. It is true that it is a loss to the country, but there is the power.

1964. From your experience what should you say is the feeling of the soldiers of the British Army with regard to the administration of justice in courts-martial?—I think they have every faith in courts-martial.

1965. If the soldiers had their choice, for instance, of the court by which they would be tried, civil or military, which do you think they would prefer?—They would much rather go to the military court.

1966. In your experience have you ever heard of appeals being made to the commanding officer to send men before a civil tribunal?—No, but I have known many instances where a soldier has kicked up a row in Newport, for example, and has been taken up by the police, and that soldier and all his comrades have known perfectly well that he has got nearly three times as much punishment as he would have got if he had been tried by a court-martial.

1967. Have you any other suggestions to make with regard to the practice of courts-martial?—No.

1968. (*Lt.-Gen. Scarlett.*) As one punishment you say you would discharge a man; if you made him lose his previous service he would have to serve so many more years to make up his time; would you make loss of previous service one of the penalties for insubordination with violence?—Yes, but that would require a very special Act in the present day, where the limit of service is defined.

1969. You have lost corporal punishment, and you want a punishment in place of that?—Yes. Do you mean to let a man forfeit his service towards good-conduct pay or towards actual service?

1970. Towards actual service?—I would limit that.

1971. Does it not occur at present that sometimes a man commits a very atrocious act for the purpose of being discharged?—Yes.

1972. (*Chairman.*) It has been suggested that, in all cases of drunkenness, there should be the power of stopping pay. Do you concur in that?—I concur perfectly in the power, without making it compulsory.

1973. Do you think that it would tend either to the stoppage of drunkenness or to the maintenance of discipline in a regiment if all fines imposed for drunkenness were paid over to some fund, from which the other soldiers of the regiment could derive some benefit, either for amusement and recreation, or in some other way?—We have so much money for amusement and recreation now that we do not know what to do with it. I would prefer giving it in charity to the married soldiers.

1974. You think that it would be advisable to apply the fines levied on drunkenness to some regimental purpose?—Yes.

1975. (*Lt.-Gen. Eyre.*) What do you think of appropriating it to providing the means of enabling men to follow trades?—We are following trades as far as we can at the present moment at Parkhurst.

1976. With regard to the increase of the power of the commanding officer. In the navy the commanding officer has the power to award a deserter imprisonment for three calendar months, and any other offender imprisonment for six weeks, or solitary confinement up to 10 days at a time, with an interval of not less than 10 days between the two periods of solitary confinement. Do you know why the military commanding officer should not have that power, with a view of doing away with the courts-martial of which you were speaking in the beginning of your examination?—I do not see why they should not have that power, but I would still give the soldier the right of appeal.

1977. Are you satisfied with the effect of prison discipline upon the soldier?—Yes, I think the prison discipline is very good.

1978. (*Chairman.*) Are you of opinion that a soldier should be allowed to have a friend to assist him with greater powers of defence than he now has?—On general courts-martial I am of opinion that it should be allowed.

1979. Not on district courts-martial or on regimental courts-martial?—The crimes for which a soldier is tried by regimental court-martial are so trivial that I think it would be superfluous If a soldier is brought before me for a crime, and I investigate it, and I think there is any doubt, and that in all probability he would not be convicted, I give him the benefit of that doubt, and I put "Not proved" in the guard report.

1980. In a general court-martial would you allow the friend or adviser of the prisoner to have the power of addressing the court as the prosecutor does?—No, I would let the prisoner read out his own defence as he now does, but I would not have too much meddling.

1981. But is it not fair to give him the same advantage as the prosecutor possesses of addressing the court?—I would make the Judge-Advocate do everything for the prisoner as he does for the defendant. I think that the Judge-Advocate on a court-martial ought to act fairly towards both parties, towards the public and towards the prisoner.

1982. (*Marquis of Hartington.*) Are the soldiers taught or allowed work at any trade in prison?—I believe not.

Col. E. R. Jeffreys, C.B.

27 April 1868.

1983. Do you think it desirable that they should be allowed to do so?—It depends upon what tools you give them, and upon their characters.

1984. But I believe that, in a civil prison, prisoners are allowed to a certain extent to work at trades, and are in some cases taught trades, are they not?—It would be a very good thing if you could do anything to be of use.

1985. For instance, making mats, or work of that kind?—That might be a question for Mr. Ramsay or the storekeeper at Pimlico.

1986. (*Mr. Whitbread.*) Are you aware that in the naval prisons they manufacture largely?—I believe they do.

1987. (*Lt.-Gen. Eyre.*) As everybody's object now is so much to raise the character of the service, and to attract the better classes into it, would not the system of trades and of encouraging the men in them, and of exempting the good men from certain things when they were able to follow those trades, show all the men out of the army that they would be able to make money in the army?—I think so, certainly.

1988. (*Marquis of Hartington.*) It would to a certain extent, would it not, be an alleviation of the prisoner's condition, if he were allowed to work at a useful trade, and it would make the period of imprisonment less wearisome?—It would make it less harassing, certainly, but I would not make it too pleasant.

1989. But you do not think that it would be so great a disadvantage as to counterbalance the advantages which in many ways would be derived from it?—Of course the country might gain a little money by it; but I think that it is doubtful whether it would be advisable, as I said before, to make the prisoner too comfortable.

1990. But would not the effect upon the prisoner, when he left prison, be a good one, he having learnt something useful?—That is doubtful.

1991. (*Lt.-Gen. Scarlett.*) Looking upon the prison as a reformatory, as well as a punishment, would it not be useful to the men afterwards?—It would be useful to a man when he came out; but it is very questionable whether it would be deterrent to other bad characters.

The witness withdrew.

Adjourned to Thursday next, at 12 o'clock.

Room E., House of Lords.

Thursday, 30th April 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
COLONEL S. N. LOWDER, C.B.
SAMUEL WHITBREAD, ESQ.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

Major-Gen. the Hon. J. Lindsay.

30 April 1868.

MAJOR-GENERAL THE HONOURABLE JAMES LINDSAY recalled and further examined.

1992. (*Chairman.*) With regard to military punishments, you are aware that under the new Mutiny Act corporal punishment is done away with?—Yes.

1993. Do you think that it will be necessary to substitute any other punishment for it with a view of keeping up proper discipline in the army?—I can hardly say what other punishment can be substituted for it, but I consider the taking away the powers which the authorities formerly possessed to have been a great evil.

1994. You do not think that either in our civil prisons or in some other way we could find a punishment which would be equally efficacious in cases of insubordination to which corporal punishment has been chiefly applied?—I do not think you can.

1995. What do you think is the punishment which the soldier dreads most at the present time, corporal punishment having been done away with?—It is a difficult thing to answer that question, I think, in one answer. There is nothing else but imprisonment with hard labour. Penal servitude is a punishment which as a general rule I do not think conveys much terror; but at any rate it is limited to certain aggravated offences. For the usual crimes which a soldier commits there is no other punishment except imprisonment with hard labour.

1996. (*Lt.-Gen. Scarlett.*) There is solitary confinement, is there not?—I have not found much advantage in solitary confinement.

1997. (*Chairman.*) Which kind of hard labour do you consider to be the severest?—I think that shot drill is the severest.

1998. Do you think that it would be possible to originate a punishment of some other kind which would combine public utility with the enforcement of discipline?—I do not think so. I have thought a great deal about it, and certainly nothing has occurred to my mind which would serve as a substitute as regards the preservation of discipline.

1999. With regard to the punishment for disgraceful conduct, in which are included pilfering and stealing from comrades, do you think that it would answer to refer all those cases to civil tribunals?—Where the crime is in connexion with a civilian, it would naturally come before the civil courts; but my own opinion is still the same: that offences which are committed inside a barrack, even purloining from a comrade or embezzlement inside a barrack, ought to be dealt with by court-martial.

2000. With regard to the punishment of non-commissioned officers, what do you understand to be the rule of punishment at the present moment; must they not be degraded from their rank before any punishment is inflicted upon them upon trial by courts martial?—They must be reduced before any other punishment can be inflicted on them.

2001. Do you think that that is absolutely essential?—Yes.

2002. But do you consider that to be in accordance with the Articles of War?—Certainly.

2003. Can you point out the Article which renders it absolutely necessary to reduce a non-commissioned officer before he is punished?—I think it is laid down in the Queen's Regulations that reduction must precede punishment; but the Article of War merely alludes to that being a punishment which must be inflicted upon a non-commissioned officer. It is not absolutely stated in so many words in the Articles of War that a non-commissioned officer *must* be reduced

to the ranks, but it stands to reason that it is so, and it is the usage and practice of the service.

2004. (*Mr. Whitbread.*) That is to say that Article states (as I read it) that when a non-commissioned officer is reduced to the ranks some further punishment may follow, but it does not order him to be reduced to the ranks; you cannot give him another punishment without reducing him to the ranks?—Certainly not.

2005. That is all that it says, is it not?—I do not think that it even says that; but it stands to reason that you could not sentence a non-commissioned officer to be put into prison without reducing him to the ranks; it would be a monstrous thing.

2006. (*Chairman.*) Do you think it desirable that there should be some punishment for non-commissioned officers without reducing them to the ranks?—I do not think so. I think that a non-commissioned officer ought to be a person who stands so high in the eyes of the men that he should not undergo ordinary punishments. The great object is that a non-commissioned officer should feel himself to be in such a superior position that every exertion on his part is required to maintain it, and that if he loses it he loses all.

2007. But is it not of frequent occurrence in the army that a non-commissioned officer is reduced to the ranks and is subsequently reinstated as a non-commissioned officer by his colonel?—Yes; it frequently happens that a non-commissioned officer is sentenced by court-martial to be reduced to the ranks; in some cases the court-martial has recommended him to mercy, which recommendation the commanding officer has accepted; and in other cases the commanding officer has reinstated the man on parade at the same moment. I have done that myself.

2008. Is it not also a frequent occurrence that a non-commissioned officer reduced to the ranks does his duty as a private soldier for a certain period and then is restored to his rank?—Yes, if he has committed a crime which makes it impossible to keep him as a non-commissioned officer he falls back intot he ranks, and the commanding officer, having regard to his previous character or his previous service, will make him a lance-corporal in a very short time.

2009. Does it not follow from what you have said, that a non-commissioned officer so reduced and so restored, must have lost more weight with the private soldiers than he would do if there was some power of punishing him without reducing him to the ranks?—He has every reason to exert himself to maintain his authority, and I do not think that that weighs with the private soldier a bit?—I think that if the non-commissioned officer is a good one, they know it well, and they are very glad to see him again restored to a position of authority. At No. 1508 of the Queen's Regulations, at page 316, there is a case in point as regards reduction. This is a case which bears collaterally upon the question previously put to me, "Every case of a non-commissioned officer convicted "of any offence by the civil power is to be reported "to the Adjutant-general, with a view to the offender's "reduction to the ranks by the special authority of the "Commander-in-Chief, as it would be contrary to the "usage of the service that a non-commissioned officer "should retain his rank after he has been subjected to "a punishment which would in ordinary cases entail "an entry in the Regimental Defaulter Book."

2010. (*Lt.-Gen. Scarlett.*) That goes to say that if he be a regimental defaulter he ought not to be a non-commissioned officer?—Just so.

2011. (*Lt.-Gen. Peel.*) Will you refer to page 18, No. 332, of the Queen's Regulations, and see whether that does not bear upon the subject?—This bears upon another question which was asked of me: "Officers are to avoid reproving non-commissioned "officers for any irregularity, neglect of duty, or "awkwardness in the presence or hearing of the "privates lest they should weaken their authority "and lessen their self-respect, unless it shall be "necessary for the benefit of example that the reproof "be public or that it shall have been provoked by "repeated neglect or irregularity."

Major-Gen. the Hon. J. Lindsay.

30 April 1868.

2012. (*Lt.-Gen. Scarlett.*) Will you read the next regulation to that?—"Non-commissioned officers are "not to be subjected to minor punishments, and when "it is necessary to confine them for any offence they "are to be placed under arrest and not sent as prisoners "to the guard room except in extreme cases when it "is necessary in the interest of the public service to "insure their safe custody."

2013. (*Lt.-Gen. Peel.*) Is not the object of both those regulations to prevent a weakening of the authority of the non-commissioned officers?—Certainly.

2014. (*Chairman.*) I understand that your opinion is that those regulations ought not to be altered?—I do not think so; I think that they are made from the experience of the service.

2015. (*Lt.-Gen. Scarlett.*) Will you read the next regulation, 334?—"Non-commissioned officers are "not to be allowed by resigning their situation to "escape trial by court-martial except by the special "sanction of the Commander-in-Chief." Occasional "instances, however, may occur in which non-com-"missioned officers finding themselves unequal to "perform the duties of their situation apply to be "allowed to resign their rank; a report of every such "case is to be made to the Adjutant-General, and a "certificate of the commanding officer, stating the "cause of the resignation, is to be appended to the "man's record of service."

2016. (*Mr. Mowbray.*) You have read the Queen's Regulation, 1508; that has reference to conviction by civil tribunals, has it not?—Yes; in giving the answer I said that it bore collaterally upon the question.

2017. What punishment by a civil tribunal would in ordinary cases entail an entry in the regimental defaulter book?—Imprisonment and fining.

2018. When a non-commissioned officer is brought before a court-martial do you not consider it proper that the court-martial should exercise its discretion on all the circumstances of the case with a view of awarding an adequate punishment?—I conclude that the functions of a court-martial are limited to trying the charge which is submitted for their decision.

2019. They have to investigate the facts to find guilty or not guilty, and if they find guilty then they have to award a punishment adequate to the offence, have they not?—Yes.

2020. Then they are forbidden to reprimand non-commissioned officers, are they not?—Yes.

2021. And if they award a sentence of imprisonment then they are obliged by the Articles of War, before awarding such sentence of imprisonment, to reduce to the ranks, are they not?—Yes.

2022. Can you give any reason why there should not be an intermediate punishment, something higher than reprimanding, which is forbidden, and something lower than reduction to the ranks followed by imprisonment, which would mark the sense of the Court of the impropriety committed by the non-commissioned officer, and yet not entail upon him the degrading consequences of reduction to the ranks?—The reprimand and other punishments which can be awarded to non-commissioned officers are in the hands of the commanding officer, and if the offence only deserves a reprimand I conceive that it would be much better that that should be given by the commanding officer, and that the man should not be brought to a court-martial at all; because it must always be remembered that the court-martial having once taken place would stand against the man for ever.

2023. But when the commanding officer does not dispose of the case by his own authority, but brings it before a court-martial, he remits that case to the consideration of the court-martial, does he not?—Yes.

2024. Then it becomes a question for them to see what is adequate punishment?—Yes.

2025. Does it necessarily follow that, because a commanding officer at the first blush may have thought that something more than such a punishment as he

Major-Gen. the Hon. J. Lindsay.

30 April 1868.

would award was deserved by the offender, the court-martial having inquired more fully into the case should award the higher punishment?—My own opinion is that if it came to that, the court should either reduce the man or acquit him, and not give the minor punishment of reprimand.

2026. I am not now speaking of the minor punishment of reprimand, but of that intermediate punishment between reprimand and reduction to the ranks, followed by imprisonment?—What would you call the intermediate punishment?

2027. Reduction in his own order, as a commissioned officer, may be placed at the bottom of the list of captains.—That is of no use. It carries no punishment at all with it, because we never look at dates in the appointment of non-commissioned officers at all, we pick out the best man. If you want a man to pay a company, or if you want a man to make a staff-serjeant, you may take a man at the bottom of the list, or who is an acting serjeant, and promote him to the first vacancy, and therefore that would carry no punishment at all with it.

2028. But is it not sometimes the case (to take a recent instance of a serjeant instructor of musketry being reduced to serjeant) that the punishment awarded carries with it as a consequence the loss of pay of 10*d.* per day?—That carried a loss of pay, but it was a punishment which the commanding officer could equally have awarded, and such a sentence by court-martial is contrary to the usage of the service.

2029. Then do I understand you to contend that the court-martial should always be absolutely compelled by law to award a punishment higher than that which the commanding officer could have inflicted?—Yes, with regard to non-commissioned officers, I think so; and the reason why I think so is this, that courts-martial upon non-commissioned officers (and I particularly allude to serjeants) ought to be as uncommon as you can make them. And therefore if you made it common that a man could easily be reduced from a staff-serjeant to a serjeant, or placed at the bottom of the list, it would lose its effect upon the rank in general, in my opinion. The serjeant should feel that if he gets drunk or repeatedly drunk, or gets into some discreditable scrape as a non-commissioned officer, he must lose all by it, and that keeps him from doing so.

2030. Are you aware of the classification of the offences which can be tried by civil tribunals?—I cannot say that I am.

2031. Certain cases, for instance, can be tried by justices at petty sessions; other cases of greater magnitude go to quarter sessions; other cases of higher magnitude still are tried by judges at assize. It may so happen that a case which is referred to quarter sessions meets there with a lesser punishment than it might have received if it had been dealt with summarily by the justices at petty sessions; or it may happen that a judge of assize administers a lesser punishment than might have been given at quarter sessions. Can you give any reason why in a military tribunal, if the matter is once referred to a court-martial, that court should necessarily be compelled, whatever may be the circumstances of the case, to award a higher punishment than a commanding officer might have given if they think the minor punishment adequate to the offence?—I give my evidence chiefly upon my own idea of discipline from the effects that I have found from the existing system, and the effects that I should anticipate from an alteration. I can only answer the question in that way.

2032. Your idea is that discipline would be interfered with if it were not absolutely imperative upon the court-martial to award a higher sentence than the commanding officer could give?—Yes, for the reasons I have given.

2033. Do you think it is consistent with their independence, or with the oath which they have taken, to administer justice, that they should administer justice so fettered?—As long as it is contained in the Mutiny Act and Articles of War.

2034. Do you consider that it is so?—Yes, I consider that that is the intention at any rate of the Articles of War, and certainly the usage of the service.

2035. To what Article of War could you refer me as to that?—The 137th Article of War does not state point blank that a non-commissioned officer must be reduced to the ranks by the sentence of a regimental or other court-martial before you can give him any other punishment, I admit, but the inference to be derived from this Article is that the prior punishment which can be awarded to a non-commissioned officer must be reduction; and I hold to that as being the best system.

2036. You are not aware of anything in the Articles of War that makes this lesser sentence illegal?—I am not aware of anything that compels it, but I think it would be a good thing if it did.

2037. Then in fact you desire an alteration in the Articles of War in conformity with what you believe to be the usage of the service?—I do; I think it would work best regimentally.

2038. (*Mr. Headlam.*) With respect to the gravest punishment—suppose that a non-commissioned officer was guilty of desertion to the enemy for instance, and the sentence of the court-martial was that he should be shot—under such circumstances there is no more reason why he should be degraded from his rank previous to the execution of his sentence than with respect to commissioned officers, is there?—There is no doubt of that; but that is going from a very small subject, perhaps, to a very large one. Deserting before the enemy is certainly one of the most serious crimes. In all probability if it was a solitary instance you might perhaps let the man off, but if you had a good number you would certainly shoot him, and then it would entirely depend upon the decision of the Commander-in-Chief.

2039. Supposing such a case, such a crime would undoubtedly render it right that the man should be shot; but under those circumstances there is no reason why he should be reduced to the ranks previous to the execution of the sentence any more than a commissioned officer should be reduced to an inferior grade before a similar punishment was inflicted upon a commissioned officer?—It is not in that case of much importance, certainly, I must confess.

2040. Does it necessarily follow that in every case it is absolutely necessary that a man should be reduced before the sentence was carried out?—It is the rule, and it would not take the Court half a second about it; you had better, I think, stick to form about it.

2041. (*Mr. Mowbray.*) There are other persons subject to the Mutiny Act connected with the army, schoolmasters, for instance, who rank as non-commissioned officers; would you necessarily reduce them to the ranks before you inflicted a punishment upon them?—Yes, I should sentence them all to be reduced and get rid of him. If he is not fit to remain as schoolmaster he had better be got rid of altogether.

2042. But I will assume that a schoolmaster has been inattentive to his duties, and so much so that it is thought right to bring him to trial by court-martial, and the court having investigated the case, think that a degradation in his own rank, which I believe in that case does carry consequences of loss of pay, would sufficiently meet the offence which he has committed—would you necessarily begin by reducing that schoolmaster to the ranks?—A schoolmaster is in a peculiar position. I do not know what to call him exactly; he is a sort of warrant officer, or something of that sort. Though he may be taken out of the ranks he is not necessarily a soldier. There have been civilians who have been appointed schoolmasters; but I think in the case of a man who is not fit to go back as a soldier, I would dismiss him the service.

2043. His legal military position is that of a non-commissioned officer, is it not?—It is. Supposing that man loses his temper in the mess room, and strikes the serjeant-major, he ought to be tried by court-

martial. At present there is no other means of meeting the case except by reduction; but in a case of that sort I do not see why he should not suffer some imprisonment with hard labour and be dismissed the service.

2044. But you are assuming a grave offence, and I am assuming a minor offence?—In the case of a minor offence if he was unfit to continue to instruct (as he would be if he committed himself and got drun and so on,) I think you had better discharge him.

2045. But I am assuming minor offences than drunkenness?—Then the commanding officer sends for him and reprimands him.

2046. But supposing that there is an amount of negligence and inattention which the commanding officer thinks should be investigated by a court-martial, would you necessarily render it obligatory upon the court-martial before awarding any other punishment to reduce that schoolmaster to the rank of a private?—I think that you are assuming the thing which never would occur; but supposing that it was so I would stick to the rule. It is his own fault if he gets into that scrape.

2047. You think that it never would occur?—I think not.

2048. You are not aware that as a matter of fact it has occurred within the last few weeks?—No doubt some curious things do happen occasionally.

2049. (*Lt.-Gen. Peel.*) Admitting that the discretion as to the amount of punishment rests with the court-martial as suggested by the Judge Advocate General, is not that discretion limited to punishments according to the usages of the service?—That is the rule in the army. Courts-martial are sworn to act according to the usage of the service.

2050. (*Chairman.*) Is that part of the oath administered?—It is.

2051. Could you refer to the oath?—It is at page 317 of the Articles of War. "You shall duly "administer justice according to the rules and articles "for the better government of Her Majesty's forces, "and according to an Act now in force for the "punishment of mutiny and desertion, and other "crimes therein mentioned, without partiality, favour, "or affection, and if any doubt shall arise which is "not explained by the said Articles or Act, then "according to your conscience, the best of your "understanding, and the custom of war in the like "cases." I said the usage of the service, which means the same thing as the custom of war.

2052. (*Mr. Mowbray.*) Then you only resort to the custom of the service, when the rules in the Articles of War and the Mutiny Act are deficient?—Yes.

2053. (*Lt.-Gen. Scarlett.*) Does a non-commissioned officer who has been reduced retain the same respect among the men generally, as if he had not been reduced; that is to say, if a man is reduced from a serjeant to be a corporal, would he be as efficient a non-commissioned officer as he would otherwise have been?—I do not think he would.

2054. Would he be as efficient?—I think if you reduced a serjeant to the rank of corporal he would be very open to a certain amount of, I will not exactly say disrespect, but the men would not think so highly of him. I think that he would lose caste more than anything else.

2055. (*Mr. Mowbray.*) That loss of caste would be as much a consequence of the offence that he had committed as the punishment which had followed the offence, would it not?—A man may be tried for what is usually termed a military offence, and he may be put back again and promoted afterwards. If it is a military offence I do not think that the soldiers would think much of the discredit of it. If it is a serious offence then, as you put it, it is a loss of caste from the effect of the crime which he has committed.

2056. (*Mr. Whitbread.*) I understand that you think it would lower a non-commissionedofficer in the opinion of the men if he was reduced in his own grade; but that it would not lower him in the opinion of the men if he was reduced to the ranks by the sentence of a court-martial; and if upon their recommendation and showing of extenuating circumstances, he were thereupon immediately promoted again to the rank of serjeant by his commanding officer?—I think the cases are very different. Supposing that you try a serjeant by a court-martial and reduce him to the ranks, and upon recommendation of mercy, or, by your own will, promote him again, that is consequent upon your feeling obliged to make an example of what you might call a military crime. I do not hesitate to say that if that serjeant is a good serjeant, and has done his duty well, the men themselves would be glad to see him put back again, and that no loss of power would accrue to that serjeant.

Major-Gen. the Hon. J. Lindsay.

30 April 1868.

2057. I understood you distinctly to say, in answer to a previous question, that although you admit a regimental court-martial to be a court for the trial of offence superior to the mere decision of the commanding officer, yet you are of opinion that a punishment which it is in the power of a commanding officer to inflict, it should not be in the power of the superior court to inflict?—Yes, I stated that before; I think that a court-martial should not inflict any punishment which it is in the power of the commanding officer to inflict.

2058. (*Chairman.*) In your experience is it a matter of frequent occurrence that the revising officer sends back the finding of a court-martial with a view to inflicting a severer punishment than that awarded by the court-martial?—I think that it is a very rare occurrence indeed, but it does occur occasionally, and I gave an instance the other day in which it had occurred. If I may be allowed to say so with regard to the question of reduction, the opinion of the officers of the army is that this book, the Articles of War and the Mutiny Act, is law, and that if they do not adhere to what is considered here by the habit of the service to be law, they are wrong; and therefore in a case which occurred the other day with regard to a court-martial, when a serjeant was not sentenced to reduction, but sentenced to a punishment which was not recognized in the Articles of War, the proper inference of the commanding officer was that the court-martial had given a punishment which it was not either according to the usage of the service, or within the compass of the Articles of War for them to give. Consequently he revised it, no doubt with the intention that the court-martial should give a severer punishment, namely, reduction, which was according to the usage of the service. The court-martial did not adhere to its finding, but varied the sentence and gave another punishment which was contrary to the usages of the service, and not within the writing of the Articles of War. It has been since stated that the court-martial had been put aside. I may state here that the origin of that was, an application from the commanding officer of the regiment at an early period after the court-martial was over, to know what he was to do; for the commanding officer, using his discretion, had confirmed the finding and disapproved of the sentence. That raised a doubt as to how that court-martial could be booked against the man; he was convicted but not sentenced; and after some consideration the Commander-in-Chief decided that the proceedings of the court were irregular, and that the only thing to do with them was what is usually termed to quash them; and that is the history of justice being said to have been done to the man.

2059. Supposing that a court-martial were to award a sentence of punishment on a non-commissioned officer, and on being ordered to revise their sentence were then to award as a punishment that that non-commissioned officer should be deprived of a post which he held in the regiment as serjeant, but not reduced from a serjeant, do you think that that is also contrary to the regulations of the army?—Certainly contrary to custom.

2060. Would it not be very unadvisable that a court-martial should interfere with the internal regulation of a regiment without the consent of the commanding officer of that regiment?—I think that the

Major-Gen. the Hon. J. Lindsay.

30 April 1868.

fewer courts-martial you have the better; they are meant to be severe when you have them if, of course, the case is proved.

2061. (*Marquis of Hartington.*) Does it ever occur that the finding of a court-martial is confirmed by the confirming officer, but that the sentence is not confirmed?—I think it is a very rare occurrence, though I cannot say that it has not happened.

2062. Do you think that it is within the power of a confirming officer to treat the finding and sentence of courts-martial in that manner?—It is in his power, but I think the general officer of the district when the case comes before him, as it does every month, would remark upon it.

2063. (*Mr. Whitbread.*) Is it in accordance with the usages of the service?—It is not according to the habits of the service, or at least I think not.

2064. (*Mr. Mowbray.*) The usual practice in such a case would be to put "confirmed, but the punish-" ment remitted," would it not?—Yes.

2065. There would be two separate acts, first the proceedings would be confirmed, and then there would be an act remitting the punishment?—Not in a case where the punishment is an improper one according to the usages of the service, because you would not remit, and I should not confirm.

2066. (*Mr. Headlam.*) It was not at all an uncommon thing, was it, when corporal punishment was awarded and also imprisonment, for the confirming officer to confirm the proceedings, but to remit the corporal punishment? — Certainly, but that is a different question. You may remit any part of the sentence if the sentence is correct.

2067. And that is not an uncommon thing?—It is a common thing. I have frequently done it.

2068. But when any portion of the punishment is illegal and not warranted by the Mutiny Act, then, under those circumstances, the proper action of the revising officer would be not to confirm the sentence?—Certainly.

2069. What is the power of a commanding officer with reference to the reduction of non-commissioned officers summarily?—It rests with the Commander-in-Chief and with the colonel of the regiment.

2070. With the colonel of the regiment, subject to the approval of the Commander-in-Chief? — No; the colonel of the regiment can do it on his own responsibility.

2071. That is not the lieutenant-colonel commanding, but the colonel of the regiment?—The colonel of the regiment.

2072. Is not that inconvenient in some cases?—I think that it is useless. For instance, the colonel of a regiment, supposing his regiment is in the East Indies knows nothing of his regiment, and the Commander-in-Chief would be a better man to do it than the colonel, I should think.

2073. Do you know how it is in the Marines?—I do not know.

2074. Would you make any alteration then with respect to the colonel of the regiment being the person who has the authority to summarily degrade a non-commissioned officer?—I would. I would take it away from the colonel, because it cannot work evenly. Troops are quartered all over the world, but I think that it should be in the power of the representative of the Commander-in-Chief in the colonies, that is to say, the lieutenant-general commanding abroad.

2075. (*Chairman.*) But is it the fact that if a regiment is quartered in India and you wished to reduce a non-commissioned officer you must send home to the full colonel?—I cannot answer that question. India is different; it has its own government and Commander-in-Chief, and everything of that sort, but it would be so in Canada.

2076. (*Mr. Whitbread.*) According to the plan which you have proposed, that regimental courts-martial should never inflict a sentence which is not a severer one than the commanding officer of the regiment has power to inflict, might it not very often arise that when a case came to trial the court-martial would find such extenuating circumstances that they would think the punishment which they were obliged to inflict far too severe, and they would have no alternative, although the offence might be distinctly proved, but either to acquit the man or else to inflict a sentence which in their opinion was far too severe for the offence?—If a sergeant commits a crime, my own opinion is that if he is convicted he ought to be reduced. I apprehend that a court-martial should not sentence a man to be confined to barracks.

2077. You think that they should never sentence a man to anything unless it was severer than anything which the commanding officer had power to inflict?—Yes, if he were convicted; but it is always in the power of the court-martial to recommend a man to mercy, and to state why they do so; and also, as I stated in my evidence on Monday last, I would give a man an appeal to a higher court.

2078. But although they might recommend him to mercy, the commanding officer might not attend to that recommendation, and the result would be that a much severer sentence would be inflicted upon the man than the court thought adequate to the offence?—It possibly might be so. At the same time the man might appeal to a higher court.

2079. Is there any appeal now?—There is an appeal to a general court-martial, and I think that that is too much. I think that the appeal should be to a district court-martial, as I stated in my evidence last Monday.

2080. (*Chairman.*) Seeing that considerable doubts have arisen in courts-martial upon this point, do you not think that it would be advisable to have a scale of military punishments by courts-martial named in the same way as in the case of punishments by civil tribunals?—I know nothing about the civil scale of punishments, but I think that the removal of all doubts would be very advisable indeed. I also think that a scale is a very good thing by way of giving a maximum. Not having thought of a scale for punishments by court-martial I see some little difficulty about it, but still I think that that might be overcome, and something which might keep courts-martial tolerably even would be useful.

2081. (*Mr. Headlam.*) Would it not be a matter of exceeding difficulty, inasmuch as many of the crimes committed vary completely according to circumstances?—There is considerable difficulty in that, because there are several circumstances. Character forms a very important element; if a man is brought before you, we will say for an act of disobedience, or perhaps habitual drunkenness, character would weigh, and therefore it does make it a matter of extreme difficulty.

2082. But, taking for instance the crime of desertion, that may be nearly the highest crime which a man could commit, if committed in the face of the enemy, and if he goes over to the enemy immediately before an action, under those circumstances it might be quite right that a man should be shot, but in another case the crime of desertion might be of very trifling moment, might it not?—I quite understand that; I think that offences in the field ought to be classed in a different category, or you might almost say in a different chapter of the Articles of War from the ordinary offences which soldiers commit in time of peace and in quarters. A man might desert to the enemy, and if the man was the best character in the world then you would treat him just the same as if he was the worst.

2083. Is it not the case that the crime of sleeping on his post is a crime for which a man may be subject to death?—In the field he would be sentenced to death, and if it was an important place he would be executed, no doubt; and that is the reason why sleeping on the post is still left in the category of offences to be tried by a general court-martial. I think that offences before the enemy should come under the head of general courts-martial, and several offences which now come under general courts-martial in time of peace

should be removed and put under district courts-martial.

2084. (*Chairman.*) But if you named the scale of punishments, could not the discretion remain the same as it does in the civil courts, that whereas in the civil courts you hear of one man picking a pocket being sentenced to one month's imprisonment, and of another committing the same crime and being sentenced to seven years' penal servitude; might not the same discretion be left in courts-martial, provided the punishments that could be inflicted were known?—Certainly, and if it were possible I should even be inclined to go further. I think that courts-martial vary in their sentences so very much from want of some guide that if you could give them a guide it would be a very good thing.

2085. (*Mr. Mowbray.*) All that the law can do is to prescribe a maximum?—All that the law can do is to prescribe a maximum.

2086. And then the maximum being prescribed it must be left to the court to apportion the sentence to the circumstances of the offence, only taking care that it be smaller than the maximum?—Yes.

2087. (*Lt.-Gen. Eyre.*) As a general rule is not that done by the Articles of War?—It is done as to imprisonment; it is done by order.

2088. (*Marquis of Hartington.*) You were asked some questions, both the last time that you were examined and to-day, with reference to the power of revision of the finding and sentence of a court-martial by the commanding officer, and I understand you to have said that you do not think it would be desirable that that power should be relaxed, but you appeared in your answer to allude chiefly to the power of revision of a sentence; do you think it necessary that the confirming officer should retain the power of sending back the finding for revision?—Yes, I think that he should retain the power.

2089. For what reason?—I have known instances where a man has been found guilty, and it appeared to the revising officer that there was not sufficient evidence to convict him. He pointed it out to the court in a memorandum, and ordered the court to reconsider their finding, thinking it better that that should be done rather than that he should overrule the court. He explained in what way the evidence fell short, and the court-martial then acquitted the man. I know an instance the other way, in which the revising officer considered that the evidence was sufficient to find the man guilty, and he pointed out where the different parts of the evidence bore upon each other, and upon that the court convicted the man. I know two instances of that sort, and I think that the great object is not to get the man off, or to convict him; the great object is that the men in a battalion should be perfectly convinced that justice is done to them, not merely justice in getting them off, but also justice in convicting them if it is necessary.

2090. But do you think that it promotes the interest of justice or of discipline that a court should be summoned to reconsider its finding when that finding has has been a finding of acquittal, such order to reconsider necessarily, though indirectly, meaning a direction on the part of the commanding officer to find the man guilty?—The revising officer never does a thing of that sort without fully explaining why he does it. That is read out to the men in square; the men know everything which occurs in the room in which that court-martial is held, and I have known instances in which men have been acquitted to the regret of the men.

2091. Do you not think that the fact of sending back a verdict of acquittal for revision does convey to a certain extent the direction of the officer of the court composed of officers subordinate to himself to find that man guilty?—I do not think so. It is the knowledge derived from experience and age giving advice to a body of men who are sitting in judgment. It is pointed out and reasons are given, and it is my belief that if those reasons are not satisfactory to the minds of the officers, they are as sure as I am sitting here to stand by their original verdict, and "respectfully" (which is the usual phraseology) "adhere to their former finding."

2092. (*Mr. Whitbread.*) Does that tend to promote discipline?—You asked me that question the other day, and I can only give you the same answer; that I do not think that it hurts discipline at all. Everything is above board.

2093. (*Marquis of Hartington.*) But do you not think that there is a distinction between giving the confirming officer the power of sending back a sentence for revision and of sending back a finding?—There is a difference, but the object is the same. The object is that full justice should be accorded, and that if there is any failure in justice from the decision of the court there should be the opportunity of revising it. The Court may take the opinion of the revising officer or not, just as they please. I never knew any evil come of it, and I never knew in my experience, either from those above me or from officers commanding regiments, that the court was in any way lessened in the opinion of the confirming authority for doing their duty as long as they adhere to the rules and customs of the service.

2094. Would it not be a very similar case to a judge directing a jury to go back and reconsider their verdict?—I do not myself think the two cases are analogous.

2095. (*Mr. Whitbread.*) In all those cases where corporal punishment can be inflicted under the Act of last year, have you not the power of inflicting penal servitude?—You have the power if they are tried by general court-martial, but not if they are tried by other courts-martial. There are only two cases in which corporal punishment under last year's rule was inflicted. My own recollection is that a general court-martial can sentence to penal servitude for anything, but I do not know whether it is so now.

2096. In military prisons what are the severe punishments that are applied as part of the sentence?—Hard labour, which consists of shot drill and performing various laborious duties in the inside of the prison, and occasionally, in places like Aldershot and Portland, working in fortifications and works.

2097. Are you well acquainted with the military prisons?—Yes.

2098. Do you think that the discipline in military prisons under a sentence of hard labour is as severe as in a large civil prison under a civil sentence?—I have no experience of civil prisons.

2099. You have no crank in use in military prisons?—No.

2100. You have no treadwheel in use in military prisons?—No.

2101. And almost your only form of hard labour, excepting shot drill, is that of general service in the prison for cooking and so on?—There are other duties, and picking oakum is one of them.

2102. But you have no really severe muscular labour, except shot drill, I think?—That is the only severe muscular labour.

2103. (*Chairman.*) What is the practice with a prisoner who has been acquitted by a general court-martial and awaits the confirming of the sentence?—The practice after general courts-martial is bad. The time which elapses between the sentence of the court and the approbation of the sentence, or the reverse, is very often a month, five weeks, or six weeks, and sometimes longer.

2104. And during the whole of that time where is the prisoner kept?—He is kept in the lock-up room; that is to say, a room which is off the guard room

2105. Is that after sentence of acquittal?—It is very rare that a sentence of acquittal takes place, in consequence of the crimes being, as you may say, common crimes and no importance, and I think if you were to ask the Judge Advocate-General he could give you a better answer than I could. It may appear an extraordinary thing that I have no experience of an acquittal. I have very little experience of general

Major-Gen the Hon. J. Lindsay.

30 April 1868.

courts-martial at all; that is to say, they are very rare where I have have been most, in Canada, except for desertion, which is a simple act in itself, and which requires no trouble whatever to prove; and therefore I cannot say that I have any experience of acquittals.

2106. Can you suggest to the Commission any mode of disposal of a prisoner who has been acquitted between the sentence and the confirmation of it?—Yes, I think that there ought to be two or three lock-up rooms attached to a guard room, in which he might be confined after the decision of the court, so that he should not be placed in the same room into which you turn every night a certain quantity of drunkards and absent men.

2107. Would any inconvenience arise from the soldier being allowed a certain degree of liberty who has been acquitted, provided that you can recover him in case of the sentence not being confirmed?—I am afraid that there would. You must remember that if it is a case of a bad character he is sure to be trying to escape.

2108. (*Mr. Whitbread.*) If he is acquitted by the Court?—But he does not know that he is acquitted.

2109. (*Chairman.*) Another witness has spoken very strongly upon this point, and says that it is a great grievance?—It is.

2110. When a man has been acquitted, would there be any great objection to his being allowed a considerable amount of liberty, provided that you could get possession of him again in case a sentence of the court is not confirmed?—I think there would be an objection, because the acquitted man might be a man of bad character, and for some days he could not know that he was acquitted, if he did, that it was confirmed.

2111. At the same time he being kept in prison, is it not a punishment for an offence which he has not committed?—It is so, but that I apprehend is the case in the same sort of way in all criminal practice, namely, that people who are acquitted have been kept some time in confinement beforehand, though in this case it may be a few days after.

2112. Is it invariably the case that when a man has been convicted the time that he suffers imprisonment between the conviction and the confirmation of the sentence is considered in the length of the sentence?—Yes, the sentence dates from the signature of the president of the court-martial.

2113. (*Mr. Mowbray.*) With respect to cases of acquittal, are you aware that the practice is that as soon as the proceedings reach the Judge Advocate-General's office it is his duty immediately to consider the proceedings and to forward them to Her Majesty, with a view to Her Majesty confirming the acquittal, if he advises Her Majesty so to do, without delay?—I believe that to be the practice on acquittal.

2114. As a matter of fact, if the proceedings of a general court-martial in which a prisoner is acquitted are received at the Judge Advocate-General's office in the morning they are usually transmitted to Her Majesty on the evening of the same day?—I understand that to be the case.

2115. (*Lt.-Gen. Eyre.*) Although you object to have the man released on acquittal from his place of imprisonment of arrest, would you object to his being released from his close imprisonment to mere confinement at the barracks?—I do not see how it is possible to do it, because, until the court-martial comes back, nobody knows anything about it, except that the evidence of previous convictions is not given.

2116. I believe it is done in some continental armies, in Prussia for example?—I do not see any great objection to it.

2117. (*Chairman.*) Have you any suggestions to make with regard to the punishment of habitual drunkenness?—Yes, I think a great evil is going on in the army now with respect to that crime. The system is to try a man for habitual drunkenness the fourth time he gets drunk. No doubt it is perfectly right that he should be severely punished for constant repetition of drunkenness, but the effect at the present moment is to fill the prisons and to make prison common; and it is my opinion that when prison becomes common it loses its effect in the eyes of men, both as a punishment and as a disgrace. I am a great advocate for giving commanding officers (as I said in my evidence before) more power, and instituting what exists so far in the civil courts, the power of a magistrate or authority under the Articles of War and the Mutiny Act, for the purpose of fining men (of course it must be limited and not exceeding so much a day), and further, for giving the man the right of appeal to a court-martial if he does not think he is justly treated in being fined.

2118. But you are aware that that Article has originated in the irregularity and variety of the sentences for drunkenness in the different regiments?—You asked me just now about a scale of punishments. I am an advocate for a scale. I think that it works well. A maximum might be given, and no doubt a commanding officer who understands his business thoroughly and knows his men well can very easily do justice to them, increasing the punishment to a man of bad character and reducing it to a man of good character, and so on; but as commanding officers change very much, I think a scale which regulates punishments to a great extent might be introduced with advantage, giving a maximum.

2119. With regard to the application of stoppages for drunkenness, to what would you apply them?—My own opinion is that they should go to the benefit of the army.

2120. Of the army generally?—Of the army generally, and not to the benefit of a regiment. I think it would be very bad policy and a great evil, and it might be liable to suspicion if you were to give a commanding officer the power of appropriating the money so stopped to the benefit of his men, or to the benefit of any society attached to his regiment, or anything of that sort. I think it should go into the hands of the Secretary of State to improve the condition of the men, either by increasing the rewards or otherwise appropriating it for their general benefit, but not regimentally.

2121. Would you place no limit to regulate the submission of the case to a court-martial?—Yes, I would name a limit.

2122. What limit would you name?—I would double the present limit at least, and make it the eighth time.

2123. (*Lt.-Gen. Eyre.*) Would you even at the eighth time make it compulsory, or would you leave it still to the discretion of the commanding officer?—I should be rather for making it compulsory. I would give him plenty of law, and then make it compulsory.

2124. For every case of habitual drunkenness after that?—No, I would start afresh.

2125. (*Lt.-Gen. Peel.*) What is the punishment now for 24 hours' absence without leave?—The commanding officer has power to stop pay to the amount of five days, and there are other punishments which he has the power to award.

2126. Is it compulsory to try that man by court-martial if it has happened four or five times?—It is not compulsory, but as a rule it is done.

2127. Then as regards a man who has been drunk three times, the fourth time it would be far better for him to be absent for 24 hours and be subject to the punishment for being absent without leave, rather than to be subject to trial by court-martial for getting drunk?—No doubt, and it often happens that men when they get drunk remain absent for that reason.

2128. Therefore the present rule leads to men absenting themselves from their regiment?—It does.

2129. (*Marquis of Hartington.*) You mentioned just now that you had a great objection to common imprisonment?—Yes, to filling prisons.

2130. Do you think that a soldier usually comes out a worse soldier after a sentence of imprisonment?—No, I do not think he does. He is worse in this way, that he has lost the fear of going into prison.

Major-Gen. the Hon. J. Lindsay.

30 April 1868.

The great fear of young soldiers is getting into prison, but having been once there, however much they dislike it while there, yet the fear of going back again does not sufficiently prevent the commission of crime.

2131. You would wish that it should not be too easy to get into prison?—I would wish that courts-martial for slight offences should be uncommon.

2132. But you do not think that the character of a soldier is so much injured by his being subject to the punishment of imprisonment that you would desire to get rid of any man who had undergone a sentence of imprisonment?—Certainly not, because he goes into a military prison where what little association he has is with other soldiers. I think it is a very bad thing to put soldiers into civil prisons as a rule.

2133. (*Lt.-Gen. Eyre.*) You do not think that the light character of the prison discipline is the cause of this?—I am told that one military prison varies very much from another; that one is considered severe and the other is not.

2134. Is not that unfortunate?—Yes, I think it is.

2135. (*Marquis of Hartington.*) Is the discipline of a prison generally considered to be light in the army?—My experience is not so. I am sure it was not so in the case of the prison I had at Montreal. It was very severe there, and the men did not like going into it.

2136. (*Mr. Whitbread.*) Is not the scale of diet in military prisons rather higher than in civil prisons?—I cannot answer that question.

2137. (*Lt.-Gen. Scarlett.*) What were the punishments in the prison at Montreal?—They were the same as in other prisons, but they were very severely carried out. We had a very severe chief warder, and as far as my experience goes, I think it depends upon the severity of the chief warder.

2138. Could you suggest any other punishments in prison than those we have, that of piling shot, solitary confinement, flogging if the visitors ordered it, and work in the fatigue ward?—I cannot suggest any others. I do not think that the treadmill would be better than shot drill.

2139. (*Lt.-Gen. Eyre.*) Do you think the living is too good?—Yes, I think generally speaking the living is too good. I think they are fed rather high.

2140. (*Mr. Headlam.*) I am afraid practically they are not very much afraid of imprisonment?—I am afraid not; but of course when it is common it loses its severity in the eyes of the men.

2141. If the punishments were generally shorter and more severe, that is the living made worse and the punishment sharper during the time they had it, do you think it would be more effective?—I am disposed to think it would.

2142. (*Lt.-Gen. Scarlett.*) Do you think long imprisonments are any advantage?—I do not think so.

2143. (*Mr. Whitbread.*) In fact you can hardly carry a very long sentence through in a military prison without a certain relaxation of the severity of the discipline, can you?—I fancy that is the case. Though I do not like long sentences, of course it is perfectly necessary that there must be some long sentences in order to have an effect upon the minds of the men, not upon the men themselves who are going into prison, but upon the minds of those who hear the court-martial read.

The witness withdrew.

Viscount Walden.

VISCOUNT WALDEN called in and examined.

2144. (*Chairman.*) Will you state the post in the army that you held last?—I was captain and lieutenant-colonel in the Guards and colonel in the army.

2145. In which regiment?—In the Grenadier Guards.

2146. During the course of your service were you called upon to take part in courts-martial?—I was for five years Assistant Adjutant-General, which is a duty which requires a knowledge of military law.

2147. During the course of your experience in that post did any circumstances occur to lead you to believe that any alterations were required in the military law of this country, or in the practice of courts-martial?—I think that regimental courts-martial might be made a little more independent; and indeed I think that all courts-martial might be made so.

2148. Do you think that their decisions should not be subject to revision in the same way that they are now?—Not their decision; their finding or their sentence.

2149. You would not allow the revising officer to send back the finding of a court?—Not if it was a mere finding, and as long as the finding was legal.

2150. Have you known any dissatisfaction to arise from the practice as it now exists?—I do not know what exists now; but formerly I do not think a regimental court-martial or any other court-martial could be called an independent court in the sense of a civil court.

2151. But would your Lordship recommend that it should be freed altogether from revision?—From all revision which affected the opinion of the court with regard to the guilt of the prisoner, and with regard to the punishment as long as it was according to law. I should give the revising authority power to revise for irregularity of procedure or irregularity of sentence, or for a finding which was contrary to the evidence as appearing in the proceedings, very much as a judge does in a civil court with a jury; and supposing they gave an illegal sentence, or an irregular sentence, or a sentence they had not the power to give, then of course the revising authority should have the power to revise.

2152. (*Marquis of Hartington.*) Would you deprive the confirming officer of the power of confirming, or of approving or disapproving, or of altering a sentence?—No.

2153. It would be on his responsibility?—It would be on his responsibility.

2154. Would you disapprove of his power of sending back the finding or sentence to the court itself for revision?—Yes; unless it is irregular.

2155. I understand that what you object to is a power which exists of sending back the finding or sentence to the court itself for revision?—Yes; unless it is irregular or illegal. Supposing the finding is contrary to the evidence as it stands upon the proceedings of the court, for instance, then I should revise the court and point out to them that they had come to a finding that was contrary to the evidence before them.

2156. But you would not deprive the confirming officer of the power of confirming or disapproving the finding, or of altering or remitting the sentence?—He might alter it so long as it was remission or mitigation, but he should not increase the sentence. I should like to see courts-martial perfectly independent as courts so far as the finding and the sentence are concerned, so long as the finding and the sentence are regular and according to law.

2157. (*Lt.-Gen. Scarlett.*) Then of what power would you deprive the revising officer?—I should deprive the revising officer of the power of calling upon a court to revise its finding, unless the finding was fairly contrary to the evidence. I presume the courts-martial, which are sworn to try according to the evidence, will acquit or convict a man to the best of their belief, as they are upon oath. The commanding officer is not upon oath, and he calls upon them to alter that which they have already done upon oath.

2158. That is to say, if there was nothing contrary to evidence you would let the finding stand?—I would let the finding stand in that case.

2159. (*Chairman.*) You would not, I presume, deprive the confirming officer of the power of mitigating the punishment?—Certainly not.

Viscount Walden.

30 April 1868.

2160. (*Mr. Mowbray.*) You would have a maximum punishment prescribed, I presume, which the court could not exceed?—As it is now there is a certain maximum in the Articles of War.

2161. But you would not also have a minimum prescribed; that is to say, that they should be bound to give not less than such a punishment?—I should keep them within the terms of the Articles of War for the time being.

2162. (*Lt.-Gen. Scarlett.*) Did you ever know an instance of an officer revising a court when the finding was according to the evidence of a court?—I have known several instances where an officer has revised a court who had acquitted a man, and that court presumedly were guided by the evidence.

2163. Then we must conclude that the revising officer disagreed with the court as to the strength of the evidence?—Yes; but what I mean is, that they may have refused to admit certain evidence, or that they may have admitted evidence that they ought not to have admitted.

2164. (*Mr. Headlam.*) Supposing that, upon revision, the confirming officer is clearly of opinion that the man ought to have been acquitted, and that the evidence in the case is not strong enough to convict him, but he has been convicted; under those circumstances would you give the revising officer the power of sending it back for the court to consider the evidence with a view to an acquittal?—I would.

2165. We will suppose, on the contrary, that on a perusal of the evidence, the confirming officer is really of opinion that the evidence is sufficient to have justified a conviction, but the court have acquitted the man; under those circumstances you would not allow the revising officer to send it back in order that the court might reconsider the evidence?—No; I should give the benefit to the prisoner, as in the case of a jury acquitting a man.

2166. With respect to punishments; supposing that the court have inflicted a punishment more severe than the revising officer thinks right, you would leave it to the revising officer to remit a portion of that punishment?—Yes.

2167. Supposing on the other hand a court had imposed a punishment decidedly less than the commanding officer thinks right; under those circumstances you would give the prisoner the benefit?—Yes, I should let it stand,

2168. (*Lt.-Gen. Peel.*) Provided it were not contrary to the custom of war?—Yes; nothing must be contrary to the custom of war.

2169. (*Mr. Whitbread.*) Do you advise that alteration on the ground that it would strengthen confidence in the administration of courts generally in the army, or upon what ground do you recommend it?—I do not think it would be detrimental to it, but that it would be beneficial.

2170. In short you would allow the revising officer the same power which now exists in the highest authority in criminal cases to mitigate a sentence; but you would not in any case allow him to revise in a sense antagonistic or hostile to the prisoner?—Certainly not.

2171. (*Chairman.*) Did you form any opinion during your experience on the present scale of punishments in the army which may be inflicted by courts-martial or by commanding officers under the Mutiny Act, and have you any suggestions to make with regard to them?—No, I think they were very fair altogether. I think the most important punishment has been done away with.

2172. Now that corporal punishment has been done away with, is it your opinion that there are any existing punishments in the army which are sufficiently stringent to make up for the loss of corporal punishment?—Certainly not.

2173. Can you suggest any other punishment that you think would be equally effective?—I know nothing as an ultimate resource, as a basis of punishment, unless you inflict death.

2174. You do not think that any amount of penal servitude can be inflicted which would have the same effect as corporal punishment in checking crime in the army?—Not in checking sudden outbursts of crime, such as mutiny, or insubordination on the part of a regiment or of a detachment on the line of march.

2175. What do you understand to be the severest punishment now existing (corporal punishment being done away with) that a commanding officer on the line of march can inflict in the case of insubordination?—There is literally no summary punishment that he can inflict.

2176. Have you known any instances in your experience where it has been necessary to inflict corporal punishment immediately on the spot by a drum head court-martial?—I have not known such a case personally, but I remember a case of a man upon whom that punishment was inflicted on the line of march near Hampton, who refused to march or to move.

2177. Supposing a soldier was to refuse to march now, what is the power that a commanding officer has?—Now he has none, except he makes a prisoner of him by main force and puts him into a cart.

2178. And your Lordship says that you cannot suggest any other punishment?—I cannot, or rather I cannot suggest the dread of any other punishment, for it is the dread that keeps the men up to the discipline in those cases. For instance the men might fall out of the ranks and go into public houses and get drunk on the line of march and refuse to come out, and you could not prevent them.

2179. But you would have the power of sending a picket of soldiers and bringing them out still, I suppose?—Yes, you might bring them out; but with the dread of this punishment I think they would come out quicker.

2180. (*Mr. Headlam.*) What would be the practice in such a case in the Continental armies?—I fancy it could hardly arise there. If a man showed anything like mutiny to his superior officer he would be liable to be shot.

2181. (*Chairman.*) Have you had much experience of foreign armies?—Not beyond having been with the French army in the Crimea, and I have lived a good deal in Prussia with the Prussian army.

2182. Could you give the Commission any information with regard to the punishments inflicted in those armies?—I cannot; I have not thought over it for some time.

2183. (*Marquis of Hartington.*) Is it your impression that in the Crimea the punishment of death was more frequent in the French army than in the English army?—We had no case of the punishment of death in the English army for a military offence, and I do not remember a case of a man being shot in the Crimea in the French army.

2184. (*Lt.-Gen. Eyre.*) Are you acquainted with the French practice?—I am.

2185. Are you aware that in the ten years up to 1855, including that year, 134 men were executed?—I can believe it to be so from what I know generally.

2186. And that 1,596 men were awarded that sentence?—I know that the discipline of the French army in that respect is much more severe than that of the English army.

2187. On the other hand are you aware that in the Prussian army in the last ten years there have been only two cases?—I was not aware of it; but I can understand it. The nature of the armies is very different.

2188. (*Mr. Whitbread.*) Is it your opinion that a man who has previously borne a good character is likely to break out into any of those serious crimes without any previous warning?—I think not.

2189. They would be confined to very bad characters, probably?—I should not call them bad characters, because they are often your best soldiers, but they are very violent men.

2190. But is it desirable to keep such men as that in your ranks?—I think so, most certainly. I think that they make your best soldiers.

2191. You said some time ago that you were desirous of making the regimental courts-martial more independent tribunals. We had evidence from a previous witness that it was not uncommon that the officers composing a regimental court-martial were censured in private by their commanding officer for not having come to such a decision as this commanding officer thought was right; is it in your experience that that happened?—Censured is perhaps a strong expression.

2192. Are you aware that they have been found fault with?—I think it is quite possible that the court might have been assembled and have had it pointed out by the revising authority that they had made some mistake or other; "wigged" is the military expression.

2193. Is it your experience that that happens?—I think it might happen under certain commanding officers.

2194. And do you not think that that is detrimental to the independence of the court?—I think so certainly.

2195. And that it ought not to be persevered in?—I do not think that that could happen if the courts were made independent.

2196. (*Chairman.*) But at the same time is it not advisable that the commanding officer should have the power of advising young officers as to their conduct generally as members of courts-martial?—I think he should have the power of instructing them.

2197. Provided he does not blame them or reprimand them for any thing they have done as members of the court?—As long as it is a matter of opinion, I should only let the revising authority find fault where they had acted contrary to law, or contrary to the evidence, or contrary to regulation.

2198. It has been stated in evidence here that there is a practice in some regiments of the commanding officer of the regiment doing what is termed "wigging" his officers in the orderly room for their conduct as members of a court-martial; are you aware of any such practice?—I think it is quite possible under certain commanding officers.

2199. But you think that that is a very objectionable practice?—Certainly; most objectionable.

2200. At the same time would you deprive the commanding officer of a regiment of the power of animadverting upon the conduct of his officers as members of a court, and of advising them as to any steps which they have taken, provided it is not in the nature of a reprimand?—As long as it is mere instruction it might, I think, be done.

2201. (*Lt.-Gen. Eyre.*) And for that object may it not be very necessary for him to speak to them and to point out what he thinks important features in any case?—Certainly, as long as it is instruction only. I think officers on a court-martial are very sensitive on this point; the oath that they take is very solemn, and they are sworn to do their duty, and they do not like to be accused afterwards of not having acted conscientiously and according to their oath.

2202. Previous witnesses have laid great stress upon a court of officers being addressed privately by the commanding officer; might not that be done with the best intentions and with the best consequences, instead of giving them what perhaps they would call a "wigging" more publicly?—Yes, I think it might. If I might suggest one thing with regard to courts-martial I think it would be a very good plan if the revising authority had the power of laying down the law to the court.

2203. (*Chairman.*) But how could that be?—Upon matters of procedure.

2204. But the revising authority may be a distant general?—But I mean when the proceedings are brought up to him for confirmation or otherwise. For instance, supposing the sentence is illegal and the revising authority considers it to be illegal, that ought to be final with the court; the court ought not to have an opinion upon that, but they ought to be guided by his opinion as to the legality or illegality of the sentence, or as to the reception or otherwise of evidence, or as to procedure.

2205. (*Mr. Headlam.*) Is not that the case at present? Suppose a court should have come to a conclusion upon improper evidence, is it not the duty of the revising officer to state that they have received evidence improperly, and under those circumstances not to confirm the proceeding?—I should make the court alter the sentence if it was an illegal sentence, and not allow them to have the power to pass it.

2206. (*Lt.-Gen. Peel.*) Then in some instances you would restrict the power of the revising officer, and in others you would give him a greater power?—I would give him the greatest power with regard to regulating the proceedings, so that they should be all according to law; but I should restrict his power of interfering with their proceedings. At present the court may still adhere to their illegal sentence.

2207. Could they adhere to it if it was contrary to law?—I think so; the revising officer does not confirm it, but the court adhere to their sentence and the prisoner escapes. But it is not only with regard to the sentence, but with regard to all the procedure. Numbers of little points come up, whether such and such a witness shall be sworn or not, and whether such evidence shall be taken or not.

2208. (*Mr. Headlam.*) It would be better if there was some one like the Deputy Judge Advocate who attended district courts-martial, because the confirming officer could not be in attendance at the trial?—Upon those two great points of the finding and the sentence when the proceedings come to him.

2209. But he could not rule as to procedure after it was over?—He could send the proceedings back, and when he revised them he might tell the court that such and such a sentence was contrary to law, and that they could not pass it.

2210. (*Chairman.*) Do you think that it would tend to better procedure in courts-martial if it was obligatory on a certain portion of the officers of every regiment to study military law to a greater extent than they now do?—I certainly think so; and I think that it would be a good plan to have a digest of military law for the use of officers.

2211. And that every officer should be passed in that digest?—Yes, and that very young officers should not be allowed to sit at all upon courts-martial.

2212. I believe it is the practice in the French and Prussian armies that a certain class of officers in every regiment have to pass through a very severe examination in military law?—I believe it is so in the Prussian army, but I am not aware whether that is so in the French army.

2213. (*Lt.-Gen. Peel.*) Is there not now a purely professional examination before an officer gets promotion from one rank to another?—In the regiment there is.

2214. Would you suggest to add to that an examination in a certain portion of martial law?—I would, but I would make the examination much more severe than it is.

2215. (*Chairman.*) You think that a certain class of officers should be passed through a severer examination in military law than is now the practice?—Yes, and I do not think that ensigns ought to sit upon courts-martial at all as members, or at all events not until after a certain number of years' service.

2216. The present practice is that in six months they may sit upon courts-martial, is it not?—They may do so, and vote as ensigns on courts, and then I think they are examined for their lieutenancies upon military law, having exercised the power all the time before.

2217. (*Lt.-Gen. Eyre.*) Then you would propose regimental courts-martial to be composed of a higher class of officers?—I would. I would have them fewer in number, and either lieutenants or captains.

Viscount Walden.

30 April 1868.

2218. (*Marquis of Hartington.*) Do you think that the Articles of War and the Mutiny Act are generally understood among officers in the army?—I do not know whether they are understood, but I do not think that they are much read. I think that they read more the Queen's Regulations.

2219. (*Mr. Mowbray.*) They are not very easy to understand, are they?—I think they require a considerable amount of study.

2220. (*Lt.-Gen. Eyre.*) Do you not think that it would be very desirable to simplify them if possible?—I think so, certainly. I should like to suggest also that serjeants should not be tried by any court-martial less than a district court-martial.

2221. (*Chairman.*) Would you apply that to all non-commissioned officers?—I would leave corporals as they are at present.

2222. (*Marquis of Hartington.*) For what reason would you suggest that change?—Because I think that a serjeant is intermediate between the rank and file and the officers of the army. You only try an officer by a general court-martial; it is a more solemn and independent court, independent of the commanding officer.

2223. (*Lt.-Gen. Eyre.*) You would do that to give them greater importance?—To give them greater importance. The president of the court is a man higher in rank, and I think that it would tend to raise the non-commissioned officers themselves in their own estimation.

2224. (*Marquis of Hartington.*) Have you ever sat upon a general court-martial?—Yes, frequently.

2225. On an officer?—I do not think I have.

2226. Do you think that the mode of procedure on a general court-martial is satisfactory, or would you suggest any alterations?—I think that the way of taking the evidence is very lengthy, writing down all the questions and answers. I think that a *vivâ voce* examination would be better.

2227. Do you think, from your knowledge of the feeling of officers in the army, that there only exists confidence in the justice which is administered by a general court-martial held on an officer?—Yes, I think so. I, myself, should not be the least doubtful if I was tried by a general court-martial that I should receive justice in my own case. But I should like to see all courts-martial made more independent of the convening authorities.

2228. (*Mr. Whitbread.*) Where a court-martial has power to inflict a mrximum sentence, do you not think that it would be advisable to include in that maximum sentence the infliction of any lesser sentence?—With regard to imprisonment, I think so.

2229. And with regard to all other sentences?—That would involve a case like that of a reduction of an officer, or the reduction of a non-commissioned officer. I do not think that it would be advisable in the case of a non-commissioned officer.

2230. For what reason?—I do not see what you could reduce him to.

2231. Supposing that he was a staff serjeant, could you not reduce him to the position of a serjeant?—That can be done already by the commanding officer.

2232. But referring solely to courts-martial?—I do not see any practical objection to it, but I do not see what good would it do, because a commanding officer can do it already, and can send him when so reduced to be tried.

2233. Supposing that a commanding officer thinks that the offence is one which deserves reduction to the ranks, but that a court-martial upon investigating the case are of opinion that an adequate punishment would be to reduce the staff-serjeant to the rank of serjeant; do you not think that it should be competent to that court to award him the sentence which they think adequate to the case, it being a lesser sentence than that which they are empowered by the Act to award?—I think that in principle it is good, but I do not see what you would gain practically by it, because the commanding officer could do it.

2234. But the commanding officer having referred it to a court-martial, and the court-martial not being of the opinion of the commanding officer, how would the matter stand then?—I see no practical objection to that.

2235. (*Mr. Mowbray.*) It is a punishment which the commanding officer cannot inflict, if the court-martial can do it there can be nothing in the nature of the punishment itself inconsistent with the custom of the service?—I think not.

2236. The custom of the service may or may not be understood to prescribe that it shall be done by such and such authority; but in the nature of the punishment itself there is nothing inconsistent with discipline?—I do not think you can reduce a serjeant to the rank of corporal. If a staff officer was tried by court-martial you could not take away his staff appointment by the sentence of the court-martial.

2237. That is your view of the law as it exists; but you admit, as I understand, that a commanding officer can reduce a staff-serjeant to a serjeant?—Yes.

2238. Then if the commanding officer can do that, it cannot be inconsistent with the discipline of the service; that is to say, it cannot be objectionable as diminishing the authority of the non-commissioned officers with the privates of the regiment?—I do not think that it does. I see no practical objection to what I consider to be the law now, or to what it used to be.

2239. Assuming that the law at present does not admit of it, you think it desirable that the change should be introduced?—It might not be objectionable, but I will not say that it is desirable, because, as I said before, I do not know what you can reduce a man to except in cases of staff appointments.

2240. (*Mr. Headlam.*) Would you see any advantage that would be gained by it?—I do not see any advantage in it, except in the case which has just been put, where the court had only one of two courses to pursue, one being to reduce the man to the ranks, which virtually ruins him, and the other to acquit him. In that case I think there would be an advantage.

2241. (*Mr. Mowbray.*) To acquit him would be on the part of the court to make a finding contrary to the oath they have taken?—It would. On the other hand the commanding officer would not call in the assistance of a court-martial.

2242. But the commanding officer having called in the assistance of a court-martial it becomes the duty of that court to award such sentence as they think the facts of the case demand and the dicipline of the service will justify?—Certainly.

2243. (*Lt.-Gen. Scarlett.*) Would such action on the part of a court-martial be in accordance with the usages and customs of war as at present instituted?—I never knew of such a case in my experience. It is certainly contrary to the customs of war.

The witness withdrew.

Col. C. R. Egerton.

Colonel Caledon Richard Egerton recalled and further examined.

2244. (*Chairman.*) You now put in some additional correspondence with regard to the courts-martial in the Grenadier Guards?—Yes; I put in correspondence which had not passed through the authorities at the Horse Guards. On the previous occasion I put in everything which had come into the hands of the authorities at the Horse Guards, but this correspondence which has passed between the commanding officer of the Guards and Colonel Sturt has since been received.

2245. (*Lt.-Gen. Peel.*) In fact, it is regimental correspondence?—Yes, it is regimental correspondence.

2246. (*Chairman.*) Not correspondence which necessarily comes to the Horse Guards?—No

2247. You fill the post of Deputy Adjutant-General to the Forces, do you not?—I do.

2248. What military post had you filled previously?—My last military appointment was Assistant Adjutant-General at Edinburgh.

2249. What regimental rank have you held?—I have commanded a depôt battalion for about nine years. I was 25 years in the 89th regiment.

2250. To what rank did you rise in the regiment?—To be lieutenant-colonel.

2251. Then of course you have had considerable experience in those posts with regard to courts-martial?—I have.

2252. Knowing the object of this Commission, have you any suggestion to make as to the constitution of courts-martial or their practice?—I have not; I think the present system works very well, and does justice to the prisoner as well as to the discipline of the service.

2253. Since you have been at the Horse Guards have you received any complaints which lead you to believe that there is dissatisfaction in the army with the present system?—No; there are failures in some courts-martial. We have had some cases lately which have been found fault with.

2254. So far as you can judge, have those failures arisen from a misunderstanding on the part of the court, or from a defect in the law?—From a misunderstanding on the part of the court of the law and practice of the service.

2255. Have those failures been serious?—I cannot say that they have been serious. There was a serious case from Canada the other day which I could mention, in which a private soldier was tried for shooting a comrade, and sentenced to penal servitude, from which the man was obliged to be released, the sentence being illegal.

2256. In what way was it illegal?—It was illegal because a general court-martial could not award penal servitude for shooting a comrade, but they could for shooting a non-commissioned officer. It would then come under the head of insubordination.

2257. Is there no military law at present by which you can try a man for shooting his comrade?—There is no capital charge on which you can try him; he should be tried by the civil power. The man shot at was a private.

2258. (*Lt.-Gen. Scarlett.*) Was the man killed?—No; he was wounded in the thigh.

2259. (*Chairman.*) Supposing that man had been killed, would there have been no military power of punishing him?—No; he must have been handed over to the civil power.

2260. It is not the first time that a case of that kind has occurred, I presume?—I do not remember a case of the kind.

2261. Supposing that a regiment was in a part of the globe where they had no power of submitting a prisoner to a civil tribunal; how would such a case be treated?—That is specially provided for, I think, in the Mutiny Act. In India, when they are 100 miles from any of the Presidencies, they may try civil offences by court-martial.

2262. But there are remote parts of Canada where regiments are quartered, and where they have not the facility of sending a prisoner before a civil tribunal?—I do not think that that Article applies to Canada.

2263. Are there any other offences committed in the army which cannot be adequately punished by courts-martial?—I do not know of any.

2264. Would you suggest that there should be general power in courts-martial to inflict adequate punishment upon any offence, however heinous, which can be committed in the army?—I think that it would be more desirable that that description of offence should be handed over to the civil power.

2265. Supposing a soldier shoots his officer, he may then be tried by court-martial and sentenced to death?—He may.

2266. What difference can there be as regards crime between shooting one man and another?—The one case involves insubordination, and the other does not. It is a thing that so very rarely happens that I should think it is hardly worth providing for.

2267. Have you any suggestions to make with regard to punishments of non-commissioned officers?—I should like to see the power of reducing a serjeant-major or a quartermaster-serjeant to the rank of serjeant given to a commanding officer, with a right of appeal to a court-martial.

2268. (*Lt.-Gen. Eyre.*) Do you mean reduction to the ranks?—Merely to the rank of serjeant.

2269. (*Chairman.*) Would you carry that farther?—I would not carry it farther. I think it would be very detrimental to the service in many respects to reduce a serjeant to the rank of corporal. The rank of corporal is the nursery for the non-commissioned officers of the army, and it would have a very bad effect on discipline to turn it into a *solatium* for reduced serjeants. It would prevent the promotion of lance corporals, and the bringing forward of young men.

2270. You would still retain the necessity of reducing a serjeant to the ranks before he can be punished?—I would.

2271. (*Marquis of Hartington.*) You heard the evidence given by Lord Walden just now, did you not?—I did.

2272. Then you disagree with him that it would not be objectionable to allow a court-martial the power of reducing a staff-serjeant to the rank of serjeant or to the rank of corporal?—With respect to a serjeant-major or to a quartermaster-serjeant, I may point out that they are the only two staff-serjeants that hold *bonâ fide* rank carrying pension, and it requires a court-martial to reduce them, and it can now only reduce them to the ranks. There is a difference between a rank and an appointment; an instructor of musketry is merely an appointment made by the commanding officer; it is a particular duty that a serjeant is put to perform, receiving extra-duty pay. Now a serjeant-major or a quartermaster-serjeant is a rank, and he can only be reduced by a court-martial, and as these men are always selected for long service and high character, I think it would be well to reserve an authority to reduce them to the rank of serjeant only, instead of being obliged to reduce them to the ranks.

2273. But in no other case?—In no other case.

2274. Is it not possible that injustice might be done in such a case as was put by Mr. Whitbread just now, and which I understand to be this: a staff-serjeant has committed some offence in the opinion of his commanding officer, the adequate punishment for which would be reduction to the ranks; he, therefore, has him tried by a court-martial. In the opinion of the court-martial, although the man has committed an offence, it is not of so grave a character as to warrant his reduction to the ranks; if you do not allow the court-martial to inflict an intermediate sentence, you place them under the necessity, either of acquitting the man, which, consistently with the evidence, they cannot do, or of awarding a sentence heavier than they consider adequate?—No; a court-martial is bound to sentence a man according to the nature and degree of his offence; but if there are any extenuating circumstances in the case, or if the man is of very good character, it is open to them to recommend him to mercy in a separate letter to the confirming officer; and I have never known such a recommendation, when there has been any ground for it, not acceded to by the confirming officer.

2275. But what objection do you see to giving the court the power of awarding the sentence, and precisely the sentence, which they consider to be the adequate one?—Because it prejudices discipline and throws discredit upon the commanding officer. It would go forth in the regiment that the commanding officer had brought a man to trial unnecessarily; but a commanding officer would not bring a man to trial unnecessarily. We generally find that if a serjeant is brought to trial it is not the first time that

Col. C. R. Egerton.

30 April 1868.

he has committed himself, unless the offence is very serious.

2276. (*Mr. Mowbray.*) Do you consider it necessary that the court should pass a sentence greater than the facts of the offence warrant in order to sustain the authority of the commanding officer?—The commanding officer would not bring a non-commissioned officer to trial except for an offence for which, if he was convicted, he ought to be reduced.

2277. Does your argument then rest upon the supposition that commanding officers are infallible?—I do not at all say so, but still commanding officers are generally men of some experience and of some judgment.

2278. (*Mr Whitbread.*) Would it not be equally prejudicial to discipline if they sent in a recommendation to mercy, and the commanding officer had to do exactly what they would have done; that is to say, pass after all the intermediate sentence?—No.

2279. For what reason?—Because justice has been done. The court have sentenced the man to the punishment which is commensurate with his offence, and they leave the power of mercy in the hands of the commanding officer.

2280. The court having sentenced the man, you think that justice is done because the court-martial has sentenced a man to a punishment which they think is unjust, and they ask the commanding officer to mitigate it?—No; they do not think it unjust, but they think that the non-commissioned officer has a good character, or that there are extenuating circumstances. They find him guilty of an offence for which he is tried; he would not be tried for that offence unless it was an offence for which he ought to be reduced. If there are mitigating circumstances those are for the confirming officer to consider. The court in a separate letter would recommend the man to mercy, or would point out any mitigating circumstances which appeared upon the face of the proceedings, and the commanding officer would take them into consideration.

2281. But supposing that a commanding officer did not attend to this recommendation to mercy, then the sentence would be that which the court who tried the prisoner would consider too severe, and therefore an unjust sentence?—It could not be too severe or unjust if it was commensurate with the nature and degree of the offence.

2282. But the court being of opinion that it was not commensurate with the nature and degree of the offence?—There are certain offences which are referred to in the Mutiny Act, and are committed by soldiers. The Mutiny Act to a certain extent, and the custom of the service also to a certain extent, prescribe a certain amount of punishment in those cases, which a court is bound to accede to; but if there are, as I said before, extenuating circumstances, they bring those to the notice of the commanding officer, and he exercises his discretion, either by diminishing the punishment or not as he thinks right; but so far as my experience goes commanding officers are always too glad to have the opportunity of releasing a non-commissioned officer who has done his duty and who has claims to such consideration; and I have rarely known any such cases in which the recommendation of a court has not been acceded to.

2283. If a court is empowered to sentence a man to imprisonment for any length of time as a maximum, it is empowered also to sentence him to any lesser period than that, is it not?—I will illustrate it by an example; supposing that a man is tried for desertion, a district court-martial may sentence that man to imprisonment to any extent; but the Queen's Regulations recommend that the time should be limited to six months. About 56 days is considered by the practice of the service the minimum amount of imprisonment for the crime of desertion, and a court-martial would not be justified in sentencing a prisoner convicted of desertion to less.

2284. If they found extenuating circumstances, would it not be in their power to sentence him to less than that?—It would not be considered the proper sentence. Any extenuating circumstances should be brought to the notice of the confirming officer, and it rests with him to diminish the sentence further beyond that certain quota which is considered commensurate with the magnitude of the crime.

2285. Would it be an illegal sentence if they passed a sentence of less than 56 days?—I am not prepared to say that it would be illegal, but it would be contrary to the oath taken by the members of the court that they would sentence the man according to the nature of the offence and according to the custom of war in like cases.

2286. (*Mr. Mowbray.*) Each case must depend upon the facts, must it not?—Desertion is a fact, and a very serious one, and should be punished accordingly.

2287. If there is a maximum of imprisonment, say for two years, you may legally imprison a man for any period short of two years, say for one hour, if one hour is considered to be the proper time to meet the offence?—I am not competent to say what is legal, or not.

2288. (*Mr. Headlam.*) I take your view to be that courts-martial should have the power of degrading a non-commissioned officer to be a private?—Certainly.

2289. But that they should not have the power of degrading him in his own rank?—Certainly not. The 137th Article of War says that a non-commissioned officer may be reduced to the ranks, but it does not say that he may be reduced to any other rank.

2290. And you approve of that state of the law?—Yes. In the case of an officer the Article of War says that he may be placed at the bottom of the list.

2291. There is no power to degrade a lieutenant to the rank of ensign, is there?—There is no power to degrade a lieutenant to the rank of ensign, or a captain to the rank of lieutenant.

2292. And you do not see any reason why it should be desirable that there should be such a power?—I do not.

2293. (*Lt.-Gen. Scarlett.*) Can a commanding officer reduce a regimental serjeant-major to be a serjeant at present?—He cannot.

2294. For inefficiency?—No; a troop serjeant-major or a colour-serjeant may be reduced to the rank of serjeant by a commanding officer, but not a regimental serjeant-major.

2295. A man may become inefficient without any fault of his own, such as from accident; what course would you take if he became inefficient?—You could not try him by court-martial for inefficiency.

2296. You could not try him by court-martial for some defect of memory, or anything of that kind?—No; he may resign, and often does so.

2297. But have you not the power of removing him for inefficiency?—No.

2298. By the power of the colonel of the regiment, or by the power of the Commander-in-Chief it may be done, may it not?—Yes; the full colonel of the regiment can do it; but not the commanding officer.

2299. But you can do that without a court-martial?—Yes.

2300. And that is the course generally taken with a man who is inefficient without any crime of his own?—Yes.

2301. Would you give a man a right of appeal to a court-martial if it was proposed to reduce him in that way?—No, not in cases of summary reduction by the Commander-in-Chief, but I would give a serjeant-major a right of appeal to a court-martial if reduced as I have proposed to the rank of serjeant by order of his commanding officer, because his rank carries pension, and a man should not be reduced so as to affect his pay and pension, unless in very special cases by superior authority, without a right of appeal to a court-martial.

2302. But for any crime beyond that to which reprimand or advice or admonition would apply, you would bring a non-commissioned officer to a court-martial?—Yes.

2303. And that court-martial would be bound to reduce him ?—It would be bound to reduce him.

2304. And you would not allow the court-martial to reduce him to any lower rank than that which he held, that is to any inferior non-commissioned officer's rank ?—Not a serjeant.

2305. Can you give any reason for not allowing that ?—I think the serjeants would not otherwise be sufficiently careful of retaining their position. I also think that when a man has arrived at the rank of serjeant and loses his position by committing himself, he ought to begin again, and that other men should have the opportunity of being brought forward.

2306. You think that he would not be so efficient after a reduction to a lower grade as he was before ?—I think that he would not be so efficient.

2307. He would not be so much respected by the men of his company ?—Certainly not.

2308. (*Chairman.*) From your experience do you believe that the existing punishments in the army are sufficient to check the crimes for which corporal punishment was formerly inflicted ?—I think that the existing punishments are sufficient to punish the individual, but that they are quite inefficient as regards the deterrent effect upon others.

2309. Can you suggest to the Commission any substitute which you think will be equally effective with corporal punishment ?—I cannot; I think that the punishment of imprisonment should be made more severe.

2310. (*Lt.-Gen. Scarlett.*) For insubordination with violence, would you invariably inflict forfeiture of service both for pay, pension, and towards discharge ?—I would not for a solitary instance. It would depend upon the man's character, but for a repeated act of it I would.

2311. Would you place it in the power of a court-martial according to circumstances to inflict it ?—I apprehend that a general court-martial has that power.

2312. (*Chairman.*) You heard the evidence which was given by the last witness; do you agree with him that it would be advisable that there should be some stricter examination in military law enforced in the army amongst officers ?—Yes, I think there would be an advantage in that. Officers are now examined, perhaps once a week or once a fortnight, by the commanding officer in the Articles of War and the Queen's Regulations and the practice of courts-martial, and the young officers attend every court-martial for instruction for six months after they join.

2313. But does it happen in every district that there are a sufficient number of courts-martial to give the officers that instruction in six months ?—Yes, I am sorry to say that there are; I always made the young officers write out the whole proceedings, and go into the next room when the court closed, and deliberate as if they were on the court, and write down their sentence, and then have it examined by the major, who would point out all the errors and bring them to me the next day.

2314. Do you believe that to be a common practice in the regiments in the army ?—I have reason to think that it is so in the depôt batallions; but I do not think it is usual in the army generally to make them go through the whole thing in that way.

2315. Do you not think that it would be an improvement upon the present system if that was enforced upon every regiment in the service ?—I think it would.

2316. (*Lt.-Gen. Eyre.*) Do you not think that sitting on courts-martial is the most important duty that young officers have to perform ?—It is by far their most important and most responsible duty.

2317. (*Lt.-Gen. Scarlett.*) What do you consider to be the chief failings of our courts-martial, taking first the regimental court-martial ?—I think, as a rule, substantial justice is done.

2318. Could you propose any mode in which a regimental court-martial could be better conducted than it is at present ?—I should like it to be made the duty of the president of a regimental court-martial to sum up the proceedings regularly as the Judge Advocate would do, and to point out beforehand what Articles of War applied to the case and what punishment could be carried out. I think most of the old captains do that; but I do not think that that is a general rule.

2319. But you would make that imperative upon them ?—I would make it imperative that they should regularly go through the proceedings, and sum up, and point out the bearings of the Articles of War upon the case.

2320. (*Lt.-Gen. Eyre.*) Would you have that recorded ?—I would.

2321. (*Lt.-Gen. Scarlett.*) Do you think that the number of courts-martial which sometimes take place on one day are injurious to the proceedings, and that they render men careless, as for instance when there are three courts-martial in one day with the same president and the same court ?—I do not think that they have that effect. Now they have printed forms, they get through them very quickly.

2322. In a district court-martial is there anything which you could improve upon ?—I would let the president of a district court-martial sum up in the same way as I would recommend that the president of a regimental court-martial should do.

2323. Would you appoint any one to defend the prisoner, or would you allow him any one to attend the court and assist him in private ?—I should have no objection to his having a friend or an officer of his company to advise him. I think that it would be very desirable so long as it was a military friend.

2324. Where there is a failure in general courts-martial, from what cause do you think it usually arises, so far as you have had experience of it ?—I have not known many cases of failure in general courts-martial. There are intricate cases in which commanding officers are as much involved almost as the officers whom they try. and in some of those cases there have been great difficulties; but as regards private soldiers and non-commissioned officers, I think it is a very rare thing that there is any failure.

2325. (*Lt.-Gen. Eyre.*) With respect to drunkenness, which is such a serious subject with us, do you consider that habitual drunkards are fit men to be retained as soldiers ?—I should be very glad to see them discharged; but it is no use discharging men unless they are marked. I would discharge any man who it could be certified could not re-enlist.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

Room E., House of Lords.

Monday, 4th May 1868.

PRESENT:

COLONEL THE RIGHT HONOURABLE JOHN WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
COLONEL S. N. LOWDER, C.B.
CAPTAIN THE HON. J. C. W. VIVIAN.
SAMUEL WHITBREAD, ESQ.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

Major-Gen. the Right Hon. Sir H. K. Storks, G.C.B., &c.

4 May 1868.

MAJOR-GENERAL THE RIGHT HON. SIR HENRY K. STORKS, G.C.B., G.C.M.G., called in and examined.

2326. (*Chairman.*) In the course of your military experience I believe you have had very good opportunities of judging of the constitution and practice of courts-martial?—I think I have.

2327. Taking general courts-martial first, have you any suggestions to offer to the Commission with regard to the constitution of a general court-martial?—No. I think the change which has been made in the Mutiny Act this year, in reducing the number of the members and laying it down that no officer should serve on a general court-martial until he has been three years in the service, a great improvement.

2328. You would not carry that farther with regard to the limitation of officers?—No.

2329. (*Capt. Vivian.*) The number is nine now, I think?—It is nine in England.

2330. (*Chairman.*) The Jamaica courts-martial were composed of seven, I believe?—Yes.

2331. But that was in consequence of the difficulty of obtaining a larger court in that locality, was it not?—It was.

2332. Was that court-martial which was sent to Jamaica constituted on the spot, or was the whole court sent from England?—The whole court, I think, was sent from England.

2333. Do you think that it is advisable to alter the present practice with regard to officers sitting on courts-martial, according to which no officer can sit on a court-martial until six months after he has joined his regiment?—I think that it should be laid down that no officer should be allowed to sit on a court-martial until it is ascertained that he is thoroughly equal to perform the duties which he is called upon to discharge as a member of a court-martial.

2334. An examination of officers I believe takes place now?—Yes.

2335. Do you think that it would be advisable to carry that examination farther?—I do not, if the examination is properly carried out.

2336. We hear that in some foreign armies there is a class of officers in every regiment who have been directed to turn their attention more exclusively than other officers to military law; that is not so, I believe, in the British army?—It is not.

2337. Do you think that it would tend to the better constitution of courts-martial if there were in every regiment a certain number of officers whose duty it was to pay greater attention to military law?—I do not think it would.

2338. By whom is the examination as to fitness carried on now?—The examination as to fitness is carried on before an officer is promoted. He has to pass an examination by a board which is appointed to examine him on his regimental duties generally, and amongst other things questions are asked him about the practice of courts-martial; but in almost every regiment the commanding officer himself or one of the field officers examines officers periodically as to the general nature of their duties. He has the young officers in the mess room and examines them as to their information and as to their knowledge of their duty in general, and of courts-martial amongst other things.

2339. But has the colonel of a regiment in appointing a regimental court-martial any choice of the officers of which that court shall be constituted?—They are taken from a roster which is kept.

2340. Does it not follow from that that an officer, whether he can pass his examination or not, must take his turn on the roster?—No, because he is never put on that roster until he is considered qualified from having sat as a supernumerary member of a court-martial, and also from the examination which he has passed. As a commanding officer I should never put an officer as a member of a court-martial until I was thoroughly satisfied that he could do his duty.

2341. (*Lt.-Gen. Peel.*) Do you not hold that the commanding officer is responsible for the fitness of an officer to serve on a court-martial?—I hold a commanding officer responsible for everything which takes place in his regiment.

2342. (*Chairman.*) Has it ever been within your knowledge that young officers have not been able to fit themselves by a sufficient knowledge of military law to sit on a court-martial?—I cannot say that it has ever come to my knowledge that an officer has not been fit.

2343. Evidence has been given here to the effect that it would be desirable to alter the mode in which the finding of the court is given, commencing with the junior officer. Do you approve of the present practice in that respect?—I think that it would be very desirable to change that.

2344. How would you suggest that the finding should be given?—I would suggest that every officer should give his opinioni n writing in a folded paper handed by him to the president of the court.

2345. More than one witness has recommended that the opinion should be taken from flanks to centre; you would not recommend that?—No.

2346. (*Lt.-Gen. Scarlett.*) Would you state your objection to the usual way of declaring the findings; why you would wish to have them written?—I would prefer having them written because I think that there is an opinion out of doors that junior officers might be influenced probably by the opinion of the senior officers. Another reason for wishing to see the existing system changed is that I have cause to think that a miscarriage of justice takes place occasionally from the junior officers giving their opinion first.

2347. (*Chairman.*) Could you say in what direction that miscarriage takes place; does it lead to a great number of acquittals of prisoners, or the reverse?—Yes, I think it leads to acquittals against the evidence, judging from the evidence which is recorded.

2348. Do you think it is advisable that in a court-martial the president should be obliged to sum up the evidence as is done in a civil court?—I have generally as president of a district court-martial, and also of a regimental court-martial, summed up as it were; that is to say, I have read the charge, and I have gone over the evidence, and have then asked the members of the court to deliver their opinions, beginning at the junior, as to whether in their opinion the prisoner was guilty or not guilty.

2349. (*Capt. Vivian.*) That is not compulsory, is it?—That is not compulsory. I have specially guarded myself against expressing any opinion of my own, or influencing in any way the opinion of any other officer, but I have only called the attention of the court to the charge and what has been alleged in support of it, and what is alleged for the prisoner's defence.

2350. (*Marquis of Hartington.*) When a Deputy Judge Advocate is present it would not be necessary for the president to do that, would it?—Not at all under existing regulations.

2351. That is his duty?—That is his duty; but the Deputy Judge Advocate only acts in general court-martials.

2352. You said, I think, that in summing up the evidence you carefully avoided expressing any opinion of your own; is it in your opinion necessary that in this summing up of the evidence you should avoid pointing out in what way particular evidence bore for or against a prisoner, or in what it was contradicted by other evidence?—I think it is important to point it out to the court.

2353. Do you see any reason why the president in a regimental court-martial or a district court-martial, or the Deputy Judge Advocate in a general court-martial, should not sum up the evidence in precisely the same way as a judge does to a jury?—I do not see any reason why he should not.

2354. (*Lt.-Gen. Eyre.*) Would you extend the practice of having Deputy Judge Advocates, whose duties are now limited to general courts-martial, to district courts-martial?—I would not. I do not think that they are necessary.

2355. (*Mr. Mowbray.*) Do you think it desirable that the proceedings of a district court-martial should be sent to the Deputy Judge Advocate of the district before they are confirmed by the general officer?—We have only Deputy Judge Advocates in England, and I have never seen the working of the system in England.

2356. Do you not think that it might be advisable to have those proceedings considered before confirmation?—Yes, I think that it would be.

2357. Is there not at present, if any difficulty arises, a want of a person trained in military law as an adviser?—I think so. There are cases in which the Judge Advocate-General, when a district court-martial is sent to England, differs as to the finding, or even as to the charge on which the prisoner has been arraigned, and he advises and directs that the proceedings should be quashed, and that the prisoner should return to his duty.

2358. At present the proceedings are confirmed by the general of the district, and are then transmitted to the Judge Advocate-General's office, are they not?—Yes.

2359. At the Judge Advocate-General's office the proceedings are all perused, and it sometimes happens that a Judge Advocate-General has to advise that the proceedings, which have been confirmed, should be set aside, whereas if the opinion of the Deputy Judge Advocate had been taken first that would not have occurred; is not that so?—Yes; I have a case in my recollection where the proceedings were quashed, and the prisoner, who was a non-commissioned officer, and who had been reduced to the ranks, was by direction of the Judge Advocate-General reinstated. That was on a question of law as regarded the charge on which the prisoner was tried.

2360. Sometimes the miscarriage arises from the improper reception of evidence, does it not?—It does.

2361. (*Chairman.*) In those cases as to which you have just spoken, has the prisoner been put to any expense in the investigation which has taken place?—I do not know of any pecuniary expense having been involved; but very often a court-martial has been set aside by the Judge Advocate-General, and the man has gone through a term of imprisonment. I have known such cases.

2362. (*Mr. Mowbray.*) And under the previous state of the law he might have been flogged?—Under the previous state of the law he might have been flogged.

Major-Gen. the Right Hon. Sir H. K. Storks, G.C.B., &c.

4 May 1868.

2363. (*Lt.-Gen. Scarlett.*) Would it not create very considerable delay to forward all courts-martial to the Judge Advocate-General before they are confirmed?—Certainly, unless it were the practice at every foreign station to have an officer specially trained who would be Deputy Judge Advocate, like the officers who are employed in this country at present.

2364. (*Chairman.*) Are there many instances in regimental courts-martial in which the charge has been found to be defective?—There are cases occasionally which I have known.

2365. To whom in a regiment is intrusted with the duty of drawing out the charge against the prisoner?—The commanding officer, it is done under his authority; it is done by the adjutant, but the commanding officer approves it, and it is his act.

2366. Is it invariably so?—Every charge is approved by the commanding officer of the regiment. A charge may be submitted by a captain of a company, but the commanding officer approves of the charge and it is virtually his charge.

2367. (*Lt.-Gen. Scarlett.*) In the case of a general court-martial I think all charges are sent to the Judge Advocate-General before the man is tried, are they not?—Not abroad, but they may be at home.

2368. (*Chairman.*) But in a regimental court-martial does the person who makes the charge invariably appear to substantiate the charge?—He is generally the principal evidence, so to say.

2369. Then does he address the court?—Certainly not; I never knew any address to the court in a regimental court-martial.

2370. Would he be allowed to address the court as the prosecutor?—I suppose there would be no objection to it, but I never saw a prosecutor address the court in a regimental court-martial. There is the adjutant there to watch the proceedings.

2371. Is it the duty of the adjutant merely to watch the proceedings in a regimental court-martial?—He acts as prosecutor. He is not put in the orders as prosecutor, but he attends there to watch the proceedings, and if the president of the court requires anything, he sends for the adjutant.

2372. (*Capt. Vivian.*) But does not the officer preferring the charge act as prosecutor?—No, because it might be a non-commissioned officer. The way in which charges are preferred against soldiers generally is this: a man is brought into barracks for being drunk and absent, he is put into the guard room and a charge is brought and put into the guard report; that charge is taken to the captain of the company the next morning, who signs it. When the prisoners in the guard room are brought before the commanding officer in the orderly room he takes the guard report, and there he has the charge which is made against the prisoner. He examines the witnesses who are brought up to support the charge, and then he decides whether he will give the man a minor punishment or whether the man shall be tried by a court-martial; if the man is to be tried by a court-martial he is taken back to the guard room, and then the charge is regularly drawn out according to the forms given in the appendix to the Queen's Regulations.

2373. (*Chairman.*) How does the president of a court-martial take possession of the charge; is it laid before him?—It is laid before him at the court.

2374. And he reads it to the court?—He reads it to the court.

2375. And in your opinion neither the adjutant nor any other officer has the power of addressing the court in relation to that charge?—It is not the practice, but I do not say that he has not the power.

2376. One of the witnesses before this Commission has stated that sometimes the adjutant has had the power of addressing the court, and has done so, his own evidence having formed a part of the case. What

Major-Gen. the Right Hon. Sir H. K. Storks, G.C.B., &c.

4 May 1868.

would be your opinion of such a proceeding?—I should think that it would be a very improper proceeding.

2377. And it should not be allowed?—It should not be allowed.

2378. (*Lt.-Gen. Scarlett.*) Are not the cases generally before a regimental court-martial so simple that they require no address from any one?—Certainly.

2379. The charges are simply laid before the president, the witnesses are called, they state what they have to say upon the charge, and the evidence is written down?—That is all.

2380. But no speech is made of any sort or kind?—No. That is the practice.

2381. (*Lt.-Gen. Peel.*) In the majority of regimental courts-martial the object only is to inflict a heavier punishment than the commanding officer has the power of inflicting himself, is it not?—That is so. No man in point of fact is brought to a court-martial, either a regimental court-martial or a district court-martial, without the commanding officer being convinced, more or less, that there is quite sufficient evidence to substantiate the charge.

2382. (*Chairman.*) In a general court-martial, do you approve of the present practice of restricting the assistance of the prisoner to a friend who shall not have the power either of examining the witnesses or of addressing the court?—I think that is right. A man has a friend to assist him, or a legal adviser to assist him, but I should be sorry to see either the legal adviser or the friend address the court.

2383. It has been suggested that the prisoner might be allowed an officer of his regiment, or of some other regiment, if approved of by the commanding officer, to assist him, and that that officer might have the power of addressing the court on behalf of the prisoner. What is your opinion upon that point?—I do not think that there is any reason why a prisoner should not have anybody to assist him if he likes; but that person cannot address the court in his behalf.

2384. And supposing that that friend was an officer of his regiment, you would not even then allow him to address the court on behalf of the prisoner?—No; I have seen the prisoner's defence read for him at a court-martial by another person, and to that I do not object.

2385. (*Lt.-Gen. Scarlett.*) But you object to any *vivâ voce* examination of witnesses, or any speech in defence of the prisoner?—I do not object to *vivâ voce* examination, but I do object to a speech.

2386. (*Chairman.*) In a general court-martial the prosecutor has the power of addressing the court, has he not?—The prosecutor has that power.

2387. At the commencement of the proceedings, and also before the termination of the proceedings?—Yes; the forms that are to be followed are laid down in the Queen's Regulations as regards the Deputy Judge Advocate, the prosecutor, and also the prisoner.

2388. But why should not the prisoner have the same advantage which the prosecutor has?—The prosecutor is a military officer who is appointed to discharge the duty of prosecutor, and the prisoner has anybody he pleases to assist him; and I think that it would be attended with great inconvenience if a prisoner were permitted to have a legal friend, or a legal adviser, to address the court *vivâ voce* or to read a written address.

2389. But the prosecutor is not a legal adviser; but he is generally an officer, is he not?—But prosecutors are very often legally advised. I have in my eye a court-martial where the prosecutor was legally advised by a legal officer of the Crown.

2390. But he has an advantage over the prisoner in that he can address the court himself, whereas if the prisoner is advised by an officer that officer cannot address the court?—I do not know any reason why the prisoner should not, with the permission of the court, have a friend to read his address for him.

2391. Would that be an advantage to him equal to that which the prosecutor enjoys?—The prosecutor in a court-martial generally reads a written address. I have never seen a prosecutor address a court *vivâ voce*.

2392. (*Capt. Vivian.*) Then you do not object to the prisoner having a friend to read his address for him?—I do not see any objection to it.

2393. (*Lt.-Gen. Scarlett.*) Is it forbidden now?—It is not that I know of. I know no reason why it should be.

2394. (*Chairman.*) But the practice, I believe, is not general?—It is not general.

2395. Generally speaking, the prisoner is obliged to read his own defence, is he not?—He is generally; but there is no reason why he should not have assistance if he applies to the court and the court give their permission. On a regimental court-martial or a district court-martial I myself have read the prisoner's defence for him, a written paper which he has given in to the court.

2396. Do you think that an alteration might take place in general courts-martial with advantage in the present practice of every question being put in writing?—Yes, I should like to see cross-examinations conducted without the question and answer being written down; by direct questions to the witness.

2397. Both in examination and in cross-examination?—Yes; I think there is no other way of getting the truth out of a reluctant or mendacious witness.

2398. Do you know in what the present practice originated?—I do not. It is a practice which is not observed, either in district courts-martial or in regimental courts-martial or in general courts-martial of an ordinary description before which soldiers appear.

2399. Then what is the distinction between a general court-martial in which that practice must be observed and one where it need not be observed?—On many general courts-martial on which I have sat, on soldiers and non-commissioned officers, the evidence in chief has been as it is in other courts-martial, viz., in a narrative form. You read the charge to the witness, and you say, "State to the court what you know "about it;" and he then states that to the court. But in cross-examination of the witness I have generally seen the questions written down by the prosecutor.

2400. And you would recommend that this should also be *vivâ voce*?—I have seen a great miscarriage of justice occasionally from not being able to get the truth out of a witness.

2401. Do you think there is any possibility, by means of written questions and deliberate replies in writing, of ascertaining the real truth?—I think it is a very long proceeding, and it gives the witness greater time to think.

2402. (*Mr. Mowbray.*) Do you think it would be desirable to have a shorthand writer at every general court-martial?—Certainly, if the questions are to be taken *vivâ voce*.

2403. And then a perfect record would be preserved for the Judge Advocate-General of all that had passed?—Yes, and for the court before they came to their decision.

2404. (*Lt.-Gen. Peel.*) Of course you would apply the same rule to the prisoner, that he should be allowed to put any questions without putting them down in writing?—Certainly.

2405. (*Chairman.*) Would you approve of its being a general rule that a soldier tried by a court-martial should have the power of selecting an officer to stand by him?—I do not think it is necessary. I think the non-commissioned officers and soldiers of the army are very well satisfied with the present arrangement.

2406. Have you in the course of your military experience heard many complaints on the part of soldiers of injustice perpetrated by courts-martial?—I have not. I have inspected a great many regiments of late years, and I have never heard any complaints. I have heard a soldier make a complaint on a matter of pay, but I never heard any complaint from any soldier yet of the proceedings of a court-martial. I have had a great many regiments under my command of late years, mixing with them every day and being seen by

the troops, and I have never heard any complaints. I think there was one case at Malta in which there was a complaint of a court-martial at a half-yearly inspection; but, if my recollection serves me correctly, it was explained to the man, and he was convinced that every justice had been done him.

2407. (*Lt.-Gen. Peel.*) Do you think a soldier would prefer having his case tried by a civil court rather than by a military court?—I think he would rather be tried by a military court.

2408. (*Mr. Mowbray.*) Is it within your experience that officers are satisfied with the present system of trial by court-martial?—I have never heard any complaints.

2409. (*Chairman.*) Would you explain to the Commission under what circumstances a court of inquiry is called for instead of a court-martial upon an officer?—A court of inquiry is a preliminary examination. It is more for the taking of evidence than anything else, but it is so far an unsatisfactory tribunal that you cannot examine witnesses upon oath.

2410. Is the result of a court of inquiry ever that an officer is censured upon the finding of that court?—Yes; I have known an officer censured by his commanding officer. The court of inquiry is strictly for the information of the commanding officer. Sometimes a court of inquiry is instructed to give an opinion, at other times the court of inquiry takes evidence without giving an opinion, and it is generally regarded as a preliminary proceeding for the information of the commanding officer, on which he may or may not think it right to bring the offender to a court-martial.

2411. Has the officer subject to the inquiry, if he is dissatisfied with the results of the inquiry, a power of appealing to a court-martial in all cases?—No officer can demand a court-martial.

2412. Has he the power of appealing to a court-martial?—I should think he could always make his appeal to the general officer, and it would be for him to decide; but I do not think an officer could demand a court-martial. There is no such thing as demanding a court-martial.

2413. (*Capt. Vivian.*) Do you know any instance in which an officer has been told, upon the report of a court of inquiry, that he must leave the service, and in which, upon his remonstrating and demanding a court-martial he has been refused that court-martial?—I do not.

2414. (*Lt.-Gen. Peel.*) Might not a court of inquiry be constituted in order to inquire into the fitness or otherwise of an officer for promotion, although it might involve no military crime for which you could try the man by court-martial?—I have never seen that done. There are regimental boards that sit for the examination of officers up to a certain rank, for subaltern officers up to the rank of captain; but I have never known an instance of a court of inquiry assembled for that purpose.

2415. May not an officer be removed from the service for unfitness without having committed any crime which might subject him to a court-martial?—There is no doubt he may be removed if the Commander-in-Chief thinks that he is an officer unfit for the service. Any officer may be removed from the service.

2416. (*Mr. Mowbray.*) Strictly speaking a court of inquiry is no court at all?—No.

2417. They have no power of compelling the attendance of witnesses, and they have no power of examining on oath?—No.

2418. (*Chairman.*) Have you any suggestions to make as to an alteration of the present practice of courts of inquiry?—No; personally, I think them unnecessary tribunals.

2419. (*Mr. Mowbray.*) And do you think them unsatisfactory?—They are unsatisfactory also.

2420. (*Chairman.*) Do you think that in all cases where it is necessary to have a court of inquiry it would be better at once to substitute a court-martial?—I think that the commanding officer ought himself to examine into the case before him, and arrive at his own decision and act accordingly, and if it was a case for a court-martial he should refer it to a court-martial.

2421. How is a court of inquiry constituted now?—By the commanding officer.

2422. Of what ranks and of what officers is it usually constituted?—It is constituted according to the nature and gravity of the case that is brought before it. Sometimes it is composed of three field officers, sometimes of a captain and two subalterns, and sometimes of three captains.

2423. That is at the sole discretion of the commanding officer?—Yes. I think a court of inquiry is useful in some respects; that is to say, a court of inquiry that inquires into the circumstances of transactions that take place, such as a fire for instance, because there you really arrive in a tangible form at the evidence, such as it is, that can be given; but in every case as regards crimes committed by officers and non-commissioned officers or soldiers, I think it is a very unsatisfactory tribunal.

2424. (*Lt.-Gen. Peel.*) As I understand, you would not relieve, by means of a court of inquiry, the responsibility of the commanding officer?—Certainly not.

2425. And that is the ground upon which you would propose to do away with courts of inquiry?—Yes.

2426. (*Chairman.*) I believe that public attention has been drawn to one or two courts of inquiry in these latter years. Can you state to the Commission what has been the ground of complaint on the part of officers?—No, I have no knowledge of that.

2427. (*Lt.-Gen. Eyre.*) The only courts of inquiry recognized in the Articles of War, 165, 166, and 167, relate to the nature of wounds, the record of services, and the illegal absence of soldiers, do they not?—That is all.

2428. (*Capt. Vivian.*) But in the Queen's Regulations the scope of a court of inquiry is very much larger, because it says by Regulation 786, that "A court of inquiry is not to be considered in any "light as a judicial body. It may be employed, at the "discretion of the convening officer, to collect and "record information only, or it may be required to "give an opinion also on any proposed question or as "to the origin or cause of certain existing facts or "circumstances," and by the preceding Regulation, "A court of inquiry may be assembled by any "officer in command to assist him in arriving at a "correct conclusion on any subject on which it may "be expedient for him to be thoroughly informed. "With this object in view, such court may be directed "to investigate and report upon any matters that "may be brought before it; but it has no power "(except when convened to record the illegal absence of soldiers, as provided for in the Articles of War) to administer an oath nor to compel the attendance of witnesses not military"?—I think it is a very unsatisfactory tribunal.

2429. (*Chairman.*) Do you think that it would be advisable at once to put a stop to the possibility of having a court of inquiry?—I can only repeat that I think it is a very unsatisfactory tribunal and a very unnecessary one.

2430. Is it of frequent occurrence to order a court of inquiry?—Yes.

2431. At present I believe the commanding officer of every regiment has the power of ordering one?—Yes, certainly.

2432. And the officers of his regiment are obliged to sit upon that court?—Yes, but they are ineligible for sitting on the court-martial afterwards, supposing a court-martial is held in consequence of the inquiry.

2433. (*Lt.-Gen. Eyre.*) Do you not think that a court of inquiry may be unavoidable under certain circumstances occurring in war, for example, as to the general management of either a fleet or an army, which is a matter with which no commanding officer or individual could inquire, and in which a court of that description would be requisite to record those

Major-Gen. the Right Hon. Sir H. K. Storks, G.C.B., &c.

4 May 1868.

facts?—Do you mean an inquiry on the part of Her Majesty's Government into the conduct of a general commanding?

2434. Might not their instructions be so framed as to avoid that, and to ascertain a number of important facts?—I think it would be much more satisfactory to bring the party to a court-martial at once.

2435. But that might be an impossible thing to do without this evidence, might it not?—But you cannot get evidence upon oath at a court of inquiry; and very often evidence given before a court of inquiry, when tested by oath and properly examined, fails.

2436. (*Lt.-Gen. Scarlett.*) Is not a court of inquiry somewhat similar to a grand jury who examine one side of a question?—A grand jury have sworn depositions before them, whereas a court of inquiry has mere evidence not taken upon oath.

2437. (*Mr. Mowbray.*) The evidence taken before the grand jury is in fact taken on oath?—They are in fact sworn depositions.

2438. Only the witnesses on the part of the prosecution are produced, and the grand jury may examine any of those witnesses, and whoever is examined is examined only on oath?—Yes.

2439. (*Lt.-Gen. Scarlett.*) But they only summon witnesses for the prosecution?—Only for the prosecution, because the grand jury examination is a preliminary examination to find a true bill or not.

2440. (*Lt.-Gen. Peel.*) But would you deprive the commanding officer of any means which he might think proper to use to find out the circumstances of the crime before he ordered a court-martial?—I would not deprive him of those means; I am merely giving my opinion that it is an unsatisfactory tribunal, and one to which I would not personally resort, unless under very exceptional circumstances. There are cases probably in which a court of inquiry might be of great use, such as the case of a fire, or a case where two officers had had a difference, and I should be more inclined, I think, to have a court of inquiry with a view of arranging those differences.

2441. (*Mr. Mowbray.*) In fact you object to the term "court," because it seems to carry with it the idea of a judicial proceeding; whereas in the Queen's Regulations it is expressly stated (as is in fact the case) that it is not in any light a judicial body?—That is one of the reasons why I object to it.

2442. There is no security for such an investigation as would be pursued by an ordinary judicial tribunal, and there is no security for the conclusion at which the court may arrive?—I think there is not.

2443. (*Lt.-Gen. Peel.*) The proceedings of a court of inquiry never go beyond the person by whom that court of inquiry was ordered in the first instance, do they? You could not put them in evidence?—No. You could not put them in evidence.

2444. In point of fact it is only for the information of the person whose duty it is afterwards to decide how the case should be treated?—Yes.

2445. (*Capt. Vivian.*) But supposing that a commanding officer orders a court of inquiry to assemble to consider something with regard to one of his officers, and that he thinks it necessary to take proceedings upon the report of that court of inquiry, such as to recommend that the officer should retire from the service; would not he then be obliged to report to the general commanding the district the fact that he submitted that that officer should be obliged to leave the regiment upon the report of that court of inquiry?—He would most likely do so.

2446. But then the officer upon whose conduct this court has been ordered to report would not have any opportunity of cross-examining the witnesses, or of otherwise testing the truth of the charges brought against him, would he?—Yes he would, because he would be present at the court of inquiry.

2447. But he cannot cross-examine witnesses?—I see no reason why he should not do so. I have been on several courts of inquiry, and I have never seen a person who appeared before a court of inquiry charged with any misconduct precluded from putting questions in cross-examination.

2448. The person charged cannot himself bring witnesses, can he?—Yes, he may.

2449. (*Lt.-Gen. Peel.*) Is not a court of inquiry often asked for by the person charged with an offence?—I have heard of officers asking for a court of inquiry into their conduct.

2450. (*Mr. Mowbray.*) But the report of a court of inquiry carries with it a semblance of authority which in your opinion it ought not to possess from the way in which its proceedings are conducted?—Yes; the court can only give their opinion upon the evidence which appears before them, and very often, the evidence not being upon oath, they do not arrive at the truth.

2451. (*Lt.-Gen. Eyre.*) As regards witnesses being upon oath, are you aware that it is the rule in Prussia that regimental courts-martial are not sworn?—I am not aware of it. I do not know anything about the Prussians.

2452. (*Marquis of Hartington.*) Would you suggest any alteration in the regulations affecting courts of inquiry?—I cannot do so. It is a subject to which I have not much turned my attention.

2453. An officer may be ordered by his superior officer to appear before a court of inquiry, may he not?—Certainly.

2454. Do you think that it is desirable that that practice should be resorted to, or do you think that it would be better that no one should be compelled to appear before a court of inquiry except voluntarily?—I should be sorry to see the existing practice altered. I think that every officer should be bound to obey the lawful command of his commanding officer, and that is a perfectly lawful command, as the regulations exist.

2455. (*Lt.-Gen. Peel.*) A military officer now may be ordered to attend a court of inquiry, but the court of inquiry have no power of insisting upon and compelling the attendance of a civilian, have they?—No, they have no power of compelling a civilian to go before them, but of course they have the power of compelling a military witness to go before them. So long as the institution of courts of inquiry is maintained I should not like to see any change made in the present regulations; I do not think that there should be anything optional as regards officers, but that they should be compelled to obey orders.

2456. (*Mr. Mowbray.*) Your idea is that they should be compelled to attend as at present, but that they should not be compelled to give any information?—Certainly not.

2457. (*Capt. Vivian.*) So long as courts of inquiry are maintained?—As long as courts of inquiry are maintained.

2458. But you think that they are unsatisfactory tribunals?—I think so.

2459. (*Marquis of Hartington.*) But you would not alter the regulations as to holding them?—I would not. There are certain cases, as I say, where you want to ascertain the facts, say about fires and things of that sort, where such courts are desirable, but I think inquiry into an officer's conduct before a court of inquiry is unsatisfactory.

2460. (*Capt. Vivian.*) Would you not alter the regulations so far as to limit the occasions on which courts of inquiry might be legally assembled to certain specific cases?—Perhaps that might be done, but it requires great consideration, and I should not like to give an off-hand opinion on it.

2461. (*Lt.-Gen. Scarlett.*) With respect to courts-martial in general, have you any suggestions to make by which you consider they might be improved as regards their practice, or their formation, or the general conduct of the courts?—I have not; I am satisfied with their composition. I think however that the liability to be tried by court-martial should be extended to all officers who hold the Queen's commission. I do not think that it should be confined only to officers upon full pay.

2462. (*Lt.-Gen. Eyre.*) In some Continental armies there are permanent courts, that is to say, the president is appointed for a year and some members for six months, and others for three months; do you see any merit in that?—No; I think that it would be very unpopular in the British army.

2463. (*Lt.-Gen. Scarlett.*) Do you think that it would be of any advantage to have permanent courts-martial, say in London, at Aldershot and in the northern district, so that instead of taking officers by roster, and as it were by chance, you should appoint some people who are well instructed and who are known?—No, I do not think so. I think the present system would be much more popular with the army at large.

2464. And you consider it to be quite efficient?—I really have heard no complaints about it.

2465. (*Lt.-Gen. Eyre.*) I believe that in civil courts after a prisoner is found guilty, he is asked by the judge if he has anything to say why sentence should not be passed upon him, would there be any good or any mischief in giving that privilege to a soldier before a court-martial?—I do not think that it is necessary; he has had every opportunity of making his defence. I do not think the army are at all dissatisfied with courts-martial, that is to say non-commissioned officers and soldiers. So far as my experience shows me, the army in general are satisfied that substantial justice is done to them.

2466. (*Capt. Vivian.*) One witness before this Commission told us that he wished the power of commanding officers to be extended, and he said that he should like them to have the same powers as those of a magistrate with regard to certain punishments; and the witness who followed him said that if such powers were given to commanding officers, he thought that it would be a very good thing to do away with regimental courts-martial altogether. What is your opinion upon that point?—I am not in favour of doing away with those courts-martial.

2467. Are you in favour of increasing the power of commanding officers with regard to the punishment of men?—Yes, I am. I should like the commanding officer to have the power of fining a soldier a small sum for drunkenness.

2468. (*Chairman.*) Subject always to an appeal to a court-martial?—Subject to an appeal to a court-martial. I would never touch a soldier's pay either for absence or for drunkenness without his being able to appeal to a court-martial if he liked.

2469. (*Capt. Vivian.*) What is the extent of a commanding officer's powers now as to minor punishments?—By the Queen's Regulations, page 82, section 339, "commanding officers are authorized to "award the undermentioned punishments only for "such offences as are not deemed of a sufficiently "serious nature to be brought under the cognizance "of a court-martial, namely: (*a*) imprisonment or "deprivation of pay, or both, to the extent authorized "by the Mutiny Act and Articles of War. The "imprisonment, which is to be reckoned from the "date of the commanding officer's award, is to be "carried out in the provost cells in conformity with "the regulations contained in section 15. In the "Royal Engineers forfeiture or reduction of the "several rates of working pay may be awarded in "certain specified cases. (*b*) Confinement to barracks for any period not exceeding 28 days, which "carries with it punishment drill to the extent of "14 days, the taking all duties in regular turn, "attending parades, and being further liable to be "employed in duties of fatigue at the discretion of "the commanding officer. Every award of confinement to barracks for 14 days and under is to "carry with it punishment drill, which in the "mounted services is to be 'kit drill,' and in the "infantry 'marching order.' (*c*) Extra guards or "pickets, but these are never to be ordered as a "punishment, except for minor offences or irregularities when on or parading for these duties."

2470. Does it say nothing about cells there?—By the Mutiny Act and the Articles of War you will find that seven days' cells may be given.

2471. One witness recommended that the power of the commanding officer should be extended to punishment up to 28 days' cells with appeal to a court-martial; do you recommend that, or not?—I do not.

2472. You think that the commanding officer's powers should not be extended?—Not as to increasing the term of imprisonment.

2473. With regard to the composition of regimental courts-martial, you said, did you not, that you thought that no officer should sit upon a court-martial until he had been three years in the service?—On general courts-martial.

2474. Would you put any limit upon the term of service after which a subaltern should sit upon a regimental court-martial?—I think that no officer should be put upon a regimental court-martial until the commanding officer is convinced that he is thoroughly acquainted with his duties.

2475. (*Chairman.*) Do you see any reason for the regulation which at present exists that an officer on half pay cannot be tried by court-martial?—No, I think it very desirable that every officer holding the Queen's commission should be liable to be tried by court-martial for military offences.

2476. Can you suggest any reason why the practice has been otherwise up to the present time?—I cannot.

2477. Have you known officers in your experience who have taken advantage of that circumstance to evade the effects of being tried by courts-martial?—I have known officers on half pay behave very improperly.

2478. And the authorities have had no power in getting at them?—None.

2479. Could you suggest any regulations which should limit the trial of an officer on half pay, or would you make him subject to all the regulations which apply to an officer of full pay?—I would make him liable to all the regulations which apply to an officer on full pay as to offences against military law.

2480. Has not the necessity often occurred to commanding officers of trying a man on half pay, and it has been denied to them in consequence of the person charged being on half pay?—It is held to be impossible to try a half-pay officer.

2481. At the Horse Guards and in the Judge Advocate-General's office?—I have always understood that it is impossible to try a half-pay officer. It is the invariable rule.

2482. (*Capt. Vivian.*) Does it not go on to specify those who can be tried, and does it not say those "who are or shall be serving with any part of Her "Majesty's army at home or abroad under the command of any commissioned officer"?—It does.

2483. Do you not think that all those persons being so clearly specified who are liable to be tried by court-martial, and all mention of officers on half pay being omitted, the section as it stands now excludes officers on half pay from being being tried by court-martial?—But officers on half pay hold the Queen's commission.

2484. (*Mr. Mowbray.*) The invariable practice has been not to try half-pay officers, has it not?—That has been the invariable practice; an officer on half pay is an unattached officer.

2485. (*Chairman.*) Is an officer on half pay subject to the provisions of the Mutiny Act in any way?—Certainly not, according to the ruling.

2486. But you would recommend that he should be subject to the Mutiny Act in every way?—I think so.

2487. (*Mr. Mowbray.*) An officer on half pay can be tried by court-martial for offences committed by him when he was on full pay, can he not?—I do not know whether or not that is so.

2488. But an officer on half pay is not liable to be tried for any offence committed by him after he went on half pay?—No.

Major-Gen. the Right Hon. Sir H. K. Storks, G.C.B., &c.

4 May 1868.

Major-Gen. the Right Hon. Sir H. K. Storks, G.C.B., &c.

4 May 1868.

2489. Then if an officer on half pay misconducts himself, there is nothing to be done but to bring the case before the Commander-in-Chief, and to leave the matter to the prerogative of the Sovereign?—That is the only course. I think that an officer on half pay might commit some very improper act as regards the army, as regards the Commander-in-Chief, or his superior officer.

2490. And if an inquiry into that act is needed there is nothing but that unsatisfactory tribunal which you have already described, namely, a court of inquiry?—You could not hold a court of inquiry upon a half-pay officer that I am aware of, but by the exercise of the prerogative of the Crown he might be removed from the half-pay list.

2491. Either step is a summary proceeding, and there is no security for a full investigation of the case?—There is not.

2492. (*Lt.-Gen. Eyre.*) Is it not the case that the Articles of War only empower a court-martial to sentence a commissioned officer?—Yes, the practice is quite clear.

2493. (*Capt. Vivian.*) You have said that you would not recommend that the adviser to a private soldier should be allowed either to address the court *vivâ voce* or to cross-examine witnesses; is it not a fact that cases of embezzlement are generally very difficult cases, involving legal difficulties?—They are.

2494. Would you recommend that such cases should continue to be tried by court-martial, or would you prefer that they should be referred to a civil tribunal?—I am rather in favour of their being transferred to the civil tribunals. We are thinking in the War Office, as regards the Departmental Corps, of having all cases of embezzlement transferred to the civil power for trial, and not trying those men by court-martial, as the courts-martial have been very unsatisfactory in their proceedings in such cases.

2495. And you would prefer, if it is possible, that all such cases should be transferred to the civil tribunal?—I do not say that I should prefer it. I should prefer that they should be tried by courts-martial, because I think that anything which tends to lessen or to diminish the military character connected with military offences is objectionable; that is to say, I think that a military offence ought to be tried before a military tribunal; but at the same time such cases involve very often such difficult points of law, and the inquiries depend so much upon very unsatisfactory evidence, that in the interests of justice probably it would be better to have them tried by civil tribunals.

2496. (*Chairman.*) Complaint has been made of the practice which now exists of a revising officer having the power of sending back the finding of the court with a view to an aggravation of the punishment; do you see any necessity for maintaining that power?—No, I think that is an improper thing. It is undesirable, I think, that a commanding officer should send back the finding for an increase of the punishment.

2497. It has been stated to us that it sometimes occurs that a court-martial has been mistaken as to the crime, and have awarded for one crime a punishment which belongs to another; would you give the revising officer in that case the power of sending it back for reconsideration?—Certainly.

2498. But that often leads to an aggravation of the punishment. For instance, a case was stated to the Commission the other day of a man who was tried for desertion, for making away with necessaries, and for fraudulent enlistment; the court-martial punished him for simple desertion, and the commanding officer sent back the finding to the court on the ground that it was an improper finding, and they then proceeded to sentence that man upon all the charges, they having had those charges before them, and having omitted to take notice of more than one of them. Do you think that, under such circumstances, it is advisible that the revising officer should retain the power of sending back a case of that kind for further punishment?—Personally speaking, I should not send that court-martial back for an increase of punishment, but I should have sent it back if they had not put the man under stoppages to replace his necessaries and the sum he received when he fraudulently enlisted. I should have considered that imprisonment for 56 days was a sufficient punishment for the desertion and the fraudulent enlistment; but I should have advised the court to put the man under proper stoppages to replace the necessaries which he had made away with; I mean that he should have been put under all legal stoppages to which he was liable under the Mutiny Act.

2499. I collect from the answer you have just given that, under certain circumstances, it is in your opinion advisable that the power of sending back the sentence for an alteration of the punishment should be maintained?—Yes, I have a strong opinion that it is advisable to allow the power of revising the finding of a court-martial. I have had occasion to send back several courts-martial in my experience in which the finding was in direct opposition to the evidence.

2500. But has it never occurred to you that there has been a finding acquitting the prisoner and that you have thought it desirable to have him convicted?—In some cases I have thought it very desirable to point out to the court the nature of the evidence and the conclusions at which they had arrived. I did afterwards confirm the court-martial, but I could not approve a court-martial which was, in my opinion, in direct opposition to the evidence.

2501. And that was an acquittal?—That was an acquittal. Those were courts-martial on officers.

2502. Did you ever know a similar instance with regard to private soldiers?—I think I have. I am in favour of retaining the power of revision. I am against revising the sentence of a court-martial as regards the quantity of the punishment awarded, but I am in favour of the confirming officer having the power of revising the proceedings as regards the finding of the court.

2503. (*Lt.-Gen. Scarlett.*) Where the man has had a lesser punishment assigned to him than probably you think he ought to have, you would probably give him the benefit of that?—I would.

2504. (*Mr. Mowbray.*) But if the man is acquitted when you think he ought to have been convicted you would not give him the benefit of the doubt entertained by the court?—I am not certain that it is a doubt. I have sometimes seen courts-martial in which the finding, in my opinion, on reading it, has been in direct opposition to the evidence.

2505. But you would not in such a case give the prisoner the benefit of the opinion of the court?—I would have the court reconsider their finding, and then if they adhered to it I have nothing left but to confirm it.

2506. There is no such proceeding, is there, in the ordinary civil tribunals of the land?—No; but I think in courts-martial the members of the court are under considerable disadvantages, so to say. The transactions generally take place in a small society where the circumstances are known beforehand; they are largely canvassed, and I cannot help thinking that officers very often are without the advantages of judges who try a case of which they know nothing.

2507. You think that the court in those cases arrive at the conclusion from extraneous considerations rather than from the evidence given before them?—Yes. In the same way I have served at a station where the military tribunals had cognizance of criminal cases between civilians and the troops, and I consider a court-martial a very unsatisfactory tribunal for that purpose.

2508. (*Mr. Whitbread.*) May I ask upon what ground you think it desirable that a sentence should not be revised as against the prisoner as regards the punishment?—I would give the prisoner the benefit of the decision of the court as regards the punishment. I might have an opinion that a man receiving 56 days has committed a crime, which, as I read the proceedings, deserved a greater amount of punishment

but still I would give him the benefit of what the court had decided.

2509. (*Lt.-Gen. Eyre.*) The benefit of the mistake?—In my opinion the benefit of the leniency they had shown.

2510. (*Mr. Whitbread.*) I fail to draw the distinction between the reasons which would actuate you in that case and in the case where the court had pronounced a sentence of acquittal?—I judge from the evidence which is before me. I have never revised a court-martial on the finding without stating my reasons, and without analysing the evidence and pointing out to the court where I differed from them.

2511. Are you of the same opinion as a witness who appeared before us at the last sitting of this Commission, that it is necessary that courts-martial should in no case pronounce a sentence which it is within the competence of the commanding officer to have pronounced without referring the matter to a court-martial?—I should not as a commanding officer interfere with the court-martial in a case in which the sentence of the court was less severe than I could have myself inflicted; but I should not approve it, because I should have sent that man before a court-martial for the reason that I thought on the preliminary examination that I had held that he deserved a punishment in excess of the punishment that I could of my own authority have awarded.

2512. Supposing that to have been the opinion of the commanding officer, and that when the prisoner came to be tried before the court-martial extenuating circumstances appeared which in their mind made the punishment which could have been inflicted by a commanding officer a sufficient one for the offence, how would you deal with such a case?—I should not interfere with the sentence of the court. I should accept it.

2513. You would approve of it?—No, there is a difference between approval and confirmation. When I entirely go with the court-martial my practice is (and I believe it is the practice of every officer of the service) to approve and confirm the proceedings; but in the other case I should only confirm the proceedings.

2514. But still you think it should be in the power of a court-martial to pronounce such a sentence as in their opinion is adequate for the offence?—But I may not agree with the court; a court-martial of course can sentence a prisoner to any punishment which it is within the competence of the court to award.

2515. You think that the maximum punishment allowed to the court-martial includes any sentence less than that?—I should think they could award less punishment than the maximum.

2516. (*Lt.-Gen. Scarlett.*) You mean, to put it very broadly, that a court-martial may give any imprisonment from a day to two years?—I should think so. I know no legal reason why they should not do so. There is no legal reason why the court should not sentence a man to any term of imprisonment which the court is competent to award.

2517. (*Lt.-Gen. Peel.*) A regimental court-martial having convicted a prisoner, you would not make it compulsory upon them to award a heavier punishment than the commanding officer had the power to inflict?—Not if the court were of that opinion. I should not interfere with it as a commanding officer.

2518. (*Mr. Whitbread.*) And you do not think it desirable to tie their hands or fetter their discretion in any way?—I think a maximum ought to be fixed for a court; but I do not think a minimum ought to be fixed. As a commanding officer I probably might not agree with the court, but I would give the prisoner the benefit of it, and I should not approve the sentence.

2519. Supposing a staff-serjeant is brought before a court-martial, it would have been in the power of the commanding officer to reduce that man to the position of a serjeant, but the commanding officer, thinking that the offence is one which deserves a more serious punishment, orders the man to be tried by a regimental court-martial, it is in the power of a regimental court-martial to reduce that non-commissioned officer to the ranks, do you not think that it also ought to be in their power to award the lesser punishment of reduction to the rank of serjeant?—I do not.

2520. Upon what ground do you draw the distinction between that case and the punishment of imprisonment and fine to which you have just referred?—Because it is not usual; it is not the practice of the service.

2521. I am speaking now of what ought to be the practice of the service and not of what is the practice?—I think it ought not to be.

2522. The maximum being fixed, do you not think that the superior court, that is the court-martial, ought to have it in its power to award any punishment short of that maximum of the same kind?—It depends very much upon what is the practice of the service. I think that a serjeant might be reduced to a corporal, but it would of course depend upon the nature and character of the offence. If a non-commissioned officer, a serjeant, had done anything that was highly improper, of course the only thing would be to reduce him to the ranks.

2523. (*Mr. Headlam.*) Would you carry this principle further, and would you give a power to reduce a lieutenant to an ensign?—I do not think I would.

2524. In any of the grades of commissioned officers would you introduce the power of reducing an officer from one grade to another?—No.

2525. But you would give that power with respect to the reduction of a serjeant to a corporal?—I would.

2526. (*Mr. Whitbread.*) The facts having been stated by previous witnesses and by yourself, I now want to know why, in your opinion, the power of awarding any sentence of the same kind short of the maximum which they are by law empowered to award, should not be given to courts-martial?—I do not see any reason why, if you define it by law, they should not have it; but at the same time I think it would have an injurious effect upon discipline. A non-commissioned officer is never tried except for a very serious offence, and a commanding officer naturally looks to a court-martial to support him in maintaining the discipline of his regiment.

2527. (*Lt.-Gen. Scarlett.*) Do you think it would be injurious to discipline to reduce a non-commissioned officer from one rank to another rank; and in fact that he would not be so efficient in the inferior rank as if he had not been reduced?—I think it would not be injurious to discipline for a court-martial to have the power of reducing a serjeant to be a corporal.

2528. But do you think that a corporal who was reduced would be as efficient a non-commissioned officer as if he had never been reduced?—I think he might be a very efficient corporal. I have seen many men who have been reduced from the rank of serjeant to be privates, who have become non-commissioned officers again, and very efficient non-commissioned officers. I have always felt great difficulty about a serjeant who is not equal to his duties. In such a case a commanding officer is in a position of great embarrassment; he does not know how to get rid of him. A man may be a very good corporal and a very bad serjeant.

2529. Do you think if a serjeant was reduced for drunkenness to the rank of corporal he would have the same command over a company as a man who had never been reduced?—I look upon drunkenness in a non-commissioned officer as a very serious crime, but there are many cases which I can suggest to myself where I should be very glad to see a court have the power of reducing a serjeant to be a corporal.

2530. (*Capt. Vivian.*) The fact of a non-commissioned officer being tried by a court-martial at all is a very serious one for him as regards his future prospects, is it not, because if he is found guilty the proceedings of the court are recorded against him,

Major-Gen. the Right Hon. Sir H. K. Storks, G.C.B., &c.

4 May 1868.

and that causes him to forfeit all rewards and pay?—That depends upon what he has been tried for. It always appears in his record of service that he has been tried by court-martial and has received punishment; but I have known many valuable non-commissioned officers who have been reduced and have been remade non-commissioned officers. I have known a non-commissioned officer who had been reduced and who had become an officer.

2531. (*Lt.-Gen. Scarlett.*) When a commanding officer by the power of the colonel reduces a non-commissioned officer, is it, generally speaking, for some crime which he has committed, or is it for inefficiency?—I have very rarely seen it resorted to. I do not think I can recall a single instance.

2532. In the event of inefficiency in a non-commissioned officer, but no crime having been committed, would not the reduction by the power of the colonel be preferable to reduction by the power of the court-martial?—Certainly, but a commanding officer has not that power.

2533. Is not that power of the colonel generally applied in such cases of inefficiency?—I believe it is, but I have rarely seen such cases.

2534. Do you believe that it would be advantageous to establish a code of minor punishments in the army?—I do.

2535. Would it be possible to establish a scale of punishments for each crime, leaving a certain limit of discretion to the court-martial, or to the commanding officer?—I think it would be very desirable to have a scale of punishments, but the scale of punishments ought to be drawn up with great consideration by experienced commanding officers of regiments, and submitted for the Commander-in-Chief's approval. I am talking of minor punishments, and not of punishments inflicted by courts-martial. The practice in regiments varies so much that it would be very desirable, if possible, to fix it, more or less.

2536. Is not the punishment for drunkenness, for example, varied very much in different regiments?—Very much. When I received an order from the Adjutant General to try every man who had been drunk four times within 12 months for habitual drunkenness, I called for returns from the different regiments under my command at that time. There were six regiments of the line, a brigade of artillery, two companies of engineers, and a colonial regiment. In one regiment of the line there were I think 110, or certainly more than a hundred men liable to be tried for habitual drunkenness, who were not tried. In other regiments in that command drunkenness had been visited more severely, and the men had been tried by court-martial for habitual drunkenness; and no doubt the men of those regiments, comparing notes with those of the other regiments, thought they were more hardly dealt with.

2537. But this is an occurrence, is it not, which took place previous to the regulation that a man must be tried by court-martial on the fourth offence?—Yes; I had a return of the men liable to be tried at that time, because I wanted to ascertain what the practice in regiments was.

2538. Do you think that the present regulation of compelling a court-martial to be held for the fourth offence is desirable?—I am for taking every step that will check drunkenness. I look upon it more with regard to stopping a soldier's pay than inflicting a term of imprisonment upon him. I would rather see a stoppage of pay and a short term of imprisonment inflicted, because you wish to take away from him the means of getting drunk.

2539. Do you think that the new regulation making it obligatory upon a commanding officer, except under certain circumstances, to try a man for habitual drunkenness on the fourth offence is an advisable regulation?—I think it has checked drunkenness a little. I have found that commanding officers viewed in such a different way their powers of discretion as regarded trying men, that I at last requested Generals of brigades to examine all untried cases, and I also myself had cases submitted to me which were not tried. The order gives a discretion—every man who has been drunk four times is to be tried, unless there are circumstances which, in the opinion of the superior authority, would render it undesirable to try him.

2540. (*Chairman.*) But, under the existing regulation, in revising the defaulter book of a regiment, it would be remarked upon by any inspecting officer, I presume, if any soldiers appeared in that book for the fourth time without being tried by a court-martial?—A good many men may be drunk between the half-yearly inspections. A general officer only sees the books at the half-yearly inspection, unless he likes to call for them at other times, which it is perfectly in his power to do.

2541. An inspecting officer would animadvert, would he not, upon any entry by which it was shown that a man who had been drunk four times had not been tried by court-martial?—I should think so.

2542. It has been suggested that the regulation should be extended; that a commanding officer should not be compelled to try a man by court-martial until the eighth time of drunkenness, what is your opinion upon that?—I do not agree in that suggestion.

2543. You would recommend that for drunkenness a fine should be imposed?—I think so.

2544. How would you apply that fine?—I should forfeit it in the same way that a man's pay for absence without leave is forfeited.

2545. On the ground that the country have lost the services of that man during the time he was drunk?—Yes, that he did not do his duty.

2546. You do not think it would be advisable to apply that fine to any fund for the good of the soldier?—I am against that.

2547. Either for the army generally, or for his regiment?—Yes.

2548. On what grounds would you object to that?—I think there are quite means enough at the disposal of regiments for every purpose that they require, and I think it would rather have the effect of making those men appear as victims. If a man contributed to that fund you might run the risk of his comrades treating him or of his being more an object of pity probably than anything else. I would forfeit his pay in the same way as his pay for absence without leave is forfeited.

2549. At the present moment is it not the case that the stoppage of pay is only awarded in cases where it is proved that the country has lost the services of a man when he is absent without leave?—Yes, and the country equally loses his services when he is drunk.

2550. (*Lt.-Gen. Scarlett.*) But now you would substitute a fine for imprisonment for drunkenness?—I would place both within the scale of minor punishments. I would let the commanding officer stop a day's pay from the man, but I would fix a limit to the stoppage. I have read some of the evidence given here, and I see some of the witnesses recommend that it should be extended, for instance, to so many days at 1*d.* a day, but I would rather fine him 1*s.* or 2*s.*, or whatever it might be considered was a right sum.

2551. (*Chairman.*) Do you think it is necessary, now that corporal punishment has been abolished by the Mutiny Act, to substitute any other punishment for those cases to which corporal punishment was applied previously?—I should be very glad to see some efficient power vested in the hands of commanding officers.

2552. Can you suggest any punishment which might be substituted for corporal punishment?—I cannot.

2553. What do you conceive to be the severest punishment now existing?—Solitary confinement.

2554. Do you think that a soldier dreads solitary confinement more than any other punishment?—I think generally they dread solitary confinement properly carried out.

2555. Is it possible under all circumstances in the British army, at the present moment, to carry out the

punishment of solitary confinement?—I do not think it is. I do not think our military prisons are in many places as good as they ought to be.

2556. Are you aware that the punishment of solitary confinement is inflicted in our civil prisons?—I had much rather that soldiers were not sent to civil prisons. I do not think that the solitary confinement in the ordinary run of gaols is at all equal to the solitary confinement that we have in the military prisons.

2557. But would it not be a very great expense to the country to subject a soldier to be confined solely in military prisons?—It subjects them to expense to confine them anywhere.

2558. But the civil prisons are generally at hand, and the military prisons are very often at a distance from where the regiment is quartered?—That would cause expense, of course. The naval prisons, where the sailors and marines are confined, is at Lewes, and men are sent from Portsmouth to Lewes to be confined there.

2559. In the north-east of England there is no military prison, I believe, is there?—There is a military prison at Manchester, I think.

2560. (*Capt. Vivian.*) Now that corporal punishment is abolished, do you not think it would be advisable to strengthen the hands of commanding officers in getting rid of bad characters?—Certainly, if they are properly marked so as to prevent their re-enlisting. We are always glad to get rid of bad characters on condition that they cannot re-enlist.

2561. Is it not the fact now that commanding officers have no power to get rid of bad characters unless they have committed some offence which causes them to be sentenced by court-martial to be marked with the letters "B.C.?"—Except under special circumstances. I have known cases in which bad characters have been represented to the proper authorities and the men have been ordered to be discharged.

2562. Notwithstanding that they have not been marked with "B.C." ?—No, but security of some kind has been taken against their re-enlisting.

2563. By some mark on their person?—The mark is generally "B.C." now.

2564. (*Lt.-Gen. Scarlett.*) But they may be disqualified by age or inefficiency altogether?—Yes.

2565. (*Mr. Headlam.*) Can you discharge a man at the end of his imprisonment without there being any sentence for his being dismissed the service?—The Commander-in-Chief can dismiss anybody.

2566. (*Capt. Vivian.*) Is it not a fact now that men in the Household Brigade are discharged without reference to the Commander-in-Chief if they conduct themselves badly?—The Household Brigade is a special corps, but I believe that to be the case.

2567. Would you recommend that the power which is now in the hands of the commanding officers of the Household Brigade should be extended to commanding officers of regiments of the line?—I would not. I should be sorry to see the commanding officer have the power of discharging.

2568. Why should you not wish that power to be extended to commanding officers of regiments of the line?—I would rather see it done on a proper representation to the Commander-in-Chief. I would not give a commanding officer the power of his own authority to discharge a man.

2569. (*Mr. Whitbread.*) Are you aware that there is no such punishment known in the civil gaols as solitary confinement?—I do not know that.

2570. Are you aware that when a court-martial sentences a man to a period of solitary confinement and to be dismissed, there is no means in the civil prisons for carrying out that sentence?—I was not aware of that. I have served so much abroad of late years that I do not know much about the English prisons, though I know the foreign prisons very well.

2571. With the exception of the sentence of solitary confinement, do you not think that the discipline of military prisons is less severe than that of the civil prisons?—I am not capable of giving an opinion upon that point.

2572. Do you think that punishment may be made more severe in the military prisons?—I think it might.

2573. Are there so many men employed in light labour about the kitchen and about the establishment generally that the sentence is in reality not a very severe one?—Yes; I should make them do all the dirty fatigue work I could, in the neighbourhood of the barracks. I think it would have a very good effect to march those men about in their prison dress with their hair cut short and their beards shaved as an example to the regiment. I think limitation of punishment is a great advantage, and also the instruction in the Queen's Regulations that the locality and climate in which the offence is committed are to be kept in view in awarding the punishment.

The witness withdrew.

THE RIGHT HONOURABLE THOMAS E. HEADLAM, a Member of the Commission, examined.

Right Hon. T. E. Headlam.

2574. (*Chairman.*) You filled the office of Judge Advocate-General for some years, I believe?—I filled the office of Judge Advocate-General from the year 1859 to the year 1866.

2575. During that period did anything lead you to believe that any alterations were required in the Mutiny Act?—I should say, with respect to the Mutiny Act as it now exists, that I think that it is very confused and unduly long, that there are many provisions in it which are not at all necessary in a Mutiny Act, and which, in fact, are unsuitable to it, and that there are some provisions which are obsolete; and I should think that it would be an exceedingly good thing if the Mutiny Act were very carefully revised and re-written, and made as clear as possible, many clauses being omitted which have no reference to the army, or which have become absolute; and if a code of that kind were once carefully drawn up, I do not see under those circumstances any advantage in having that code of military law re-enacted every year. I should make it a permanent code, precisely the same as a civil code. The only portion of the Mutiny Act which would have to be re-enacted every year would be that clause stating the number of men who would be made subject to that permanent code. I think that would be laying the foundation of a much more accurate code of military law than we at present possess.

2576. (*Lt.-Gen. Eyre.*) That would be like the Continental codes, would it not?—I cannot speak as to the Continental codes; but it would be as good, as clear, and as complete a code as could be framed. I see no advantage in having it renewed every year.

2577. (*Capt. Vivian.*) You would have the Mutiny Act renewed every year?—I would retain the special clause defining the number of men and authorizing the men to be subject to the permanent code, but the permanent code itself I would make a permanent Act.

2578. (*Mr. Whitbread.*) Like the Naval Discipline Act?—Much the same.

2579. (*Capt. Vivian.*) Then if any member of the House of Commons wanted to make an alteration in the code he would have to bring up a special resolution for the purpose?—Yes; in precisely the same manner as an alteration of the general law of the kingdom.

2580. (*Chairman.*) You do not think that it is of any public advantage that the Mutiny Act should be re-enacted every year?—So far from its being an advantage I think that there are a great many disadvantages in it; I think that if the Mutiny Act had been enacted in the shape which I suggest, it would have been in an infinitely better state than it is at the present moment.

Right Hon. T. E. Headlam.

4 May 1868.

2581. Can you point out to the Commission any principal instances in which you think the Mutiny Act is deficient in regularity and uniformity?—I will open it at the 86th section, where I find that there are penalties upon toll-keepers: "If any toll collector "shall demand and receive toll from any of Her "Majesty's officers or soldiers on duty or on their "march, for themselves or for their horses" (and so on) "every such toll-keeper or other person respect- "ively, shall forfeit for every such offence any sum "not exceeding 5*l.* nor less than 40*s.*" Punishments upon toll-keepers are quite out of place in the Mutiny Act. They are part of the law affecting toll-keepers, but they have nothing in the world to do with soldiers; and there are several clauses of that description. I think that there is hardly a section in the Mutiny Act which is well constructed, or which might not be very much abbreviated and made infinitely clearer.

2582. But of course it would be necessary in the first instance to submit any alteration of the Mutiny Act to Parliament?—It should be a regular Act of Parliament, very carefully drawn and considered, and passed precisely in the same manner as any other Act of Parliament. Then, having made the Mutiny Act as clear and as accurate and as precise as possible, I think that the decisions of the Judge Advocate-General upon any important points should be from time to time printed and circulated. The effect of that would be much the same as in the civil courts: that you would have a code, and you would have that code explained by decisions upon important points made by the first constituted authorities upon the subject; and in that way you would, by degrees, get military law clearer and clearer, and any doubtful point would be cleared up.

2583. (*Capt. Vivian.*) I suppose that that includes the fact that, if the Judge Advocate-General finds reason to object to the proceedings of a court-martial upon any legal grounds, he should give those reasons in his decision?—Undoubtedly. I should not give the Judge Advocate-General the power of circulating any law except upon cases which were submitted to him; it would be precisely like a judge—they should not be extra-judicial, but that points which had occurred in practice, and upon which he had given a decision, should be made known, supposing they were of sufficient consequence to make it desirable that they should be so made known.

2584. (*Chairman.*) In what way do you recommend that they should be made known?—I think they should be printed and circulated once every year, and sent to the Deputy Judge Advocates and to the commanding officers of regiments; but I will not precisely define what the circulation should be.

2585. But the object would be to regulate the proceedings of future courts-martial?—Undoubtedly.

2586. Then of course those decisions should be circulated in every regiment?—They should be circulated as widely as they conveniently could be circulated.

2587. Have you any other suggestions to make to the Commission?—Not upon that portion of the subject.

2588. Have you any special suggestions to make with regard to general courts-martial?—I have not so much to submit to this Commission for this reason: that in the year 1864, my attention was directed generally to the defects in the administration of military law, and at that time I was a party to those proposals which were drawn up in 1864, which contained the views which I held as to the improvement of courts-martial, and of general courts-martial more especially, and I have every reason to suppose that the alterations which were then made have done a great deal of good. The most important alteration was that of the establishment of permanent Deputy Judge Advocates, who have, I believe, done their work exceedingly well; and of course the longer they last the more knowledge they get, and the greater confidence is placed in their judgment, so that their usefulness is gradually increasing, and I think they have very much improved the system of military justice. But before that time I should say that I was very much dissatisfied, not with courts-martial generally, but with some particular courts-martial. I thought that the general administration of justice in the army was very good, but every now and then cases of considerable difficulty occurred, which will be quite familiar to the Commission—cases of the trial of officers, or cases of more than ordinary difficulty,—and in those cases a failure of justice almost invariably happened from some cause or another. It was in consequence of that that those resolutions were arrived; at and so far as I know at present, I think they have done a great deal of good, and I am not prepared to make any suggestion in addition to them.

2589. It was not your duty as Judge Advocate-General to attend courts-martial at all, was it?—Not to be personally present.

2590. The Deputy Judge Advocates are permanently selected for each district, are they not?—They are not permanent; I think it is for a term of five years that they are appointed.

2591. Who appoints them?—I consider that the Judge Advocate-General appoints them. They were appointed on the recommendation of His Royal Highness the Commander-in-Chief, but I considered that I appointed them, and that I was responsible for them.

2592. From what class did you appoint them?—They were officers of a certain rank and position in the army, but I did not consider that any particular rank was essential.

2593. You did not select them for their legal knowledge exclusively?—No; I do not think that there was any opportunity of selecting any man who had given any particular proof of legal fitness.

2594. You did not select barristers, for instance?—No; three officers were selected.

2595. (*Capt. Vivian*). Was the selection confined to men of military rank?—No; after inquiring as much as I could concerning them, I appointed gentlemen who were recommended by the Commander-in-Chief, but I considered myself responsible for them.

2596. (*Chairman*). What is the nature of the appointment?—I am not prepared to say what is the amount of remuneration that they receive; but I think they are appointed for five years, and their duties are defined by those resolutions.

2597. How long has that practice gone on?—Those resolutions are dated 1864, and I should think they came into operation in 1865.

2598. Then you have not had an opportunity of replacing any of the original appointments?—I have not.

2599. What do you understand to be the rule now with regard to the renewal of the office?—I am speaking from memory, and I may be inaccurate; but my impression is that they are appointed for five years, subject to re-appointment.

2600. Should you think it advantageous that that office should be made an exception to the general rule of staff appointments, and that the Deputy Judge Advocate should be re-appointed to his existing post?—I think that any Deputy Judge Advocate who has given satisfaction, and who has acquired knowledge, and has given grounds for placing confidence in him, would be re-appointed.

2601. How many Deputy Judge Advocates are there in the United Kingdom?—Three.

1602. Does your experience lead you to believe that that is a sufficient number for the whole country?—I have no reason to suppose that it is not so.

2603. Can you give the Commission any idea of the average number of cases which come before those Deputy Judge Advocates?—I think there was a pressure, and a considerable pressure, upon the Deputy Judge Advocate who acted in Ireland during the time of the Fenian conspiracy; but subject to that I have no reason to suppose that the work is more than they can get through. I cannot state the average number

of general courts-martial in the course of the year, but it can be ascertained without the slightest difficulty.

2604. But each of the Deputy Judge Advocates is now compelled to attend every general court-martial in his district?—One of them must attend every general court-martial.

2605. May any Deputy Judge Advocate attend a court-martial in any part of the United Kingdom?—They are appointed to particular districts; but it would not interfere with the validity of a court-martial if it were attended by a Deputy Judge Advocate other than the one who had been appointed to the district in which it was held. Unless there was some order for it, each man would attend the courts-martial in the particular district to which he was appointed.

2606. What do you consider to be the special duty of the Deputy Judge Advocate under the present regulations?—I do not think I can define it better than by reading this resolution:—"That he should "maintain an entirely impartial position, and act as "assessor to the Court. That he should give his "advice on all matters of law, evidence, or procedure; "and whether consulted or not, interfere to ensure the "due formality and legality of the proceedings. That "at the conclusion of the case, he should sum up the "evidence, and give his opinion upon the law before "the Court proceeds to deliberate upon its finding."

2607. During your experience at the time you held office have you any reason to believe that his duties could be enlarged with advantage beyond what you have now stated?—No; I think that the powers given to him were very ample. I considered that he was to decide upon all matters of law, and that he had to fulfil as nearly as possible the duties of a judge at a civil trial.

2608. Do you think that under those powers which you have now defined it was incumbent on him in any way to take charge of the prisoner's case?—Precisely in the same way as a judge takes charge of the prisoner's case if he sees any defect for the benefit of the prisoner of which notice has not been taken.

2609. (*Capt. Vivian.*) Do not the Queen's Regulations specially say that he is to take care of the prisoner, and that in all cases where a prisoner is undefended, the Deputy Judge Advocate is to take care that the prisoner does not lose any privilege that the law allows him in the conduct of the trial?—I consider it to be his duty to play as nearly as possible the part of a judge at common law, to the same extent that a judge at common law looks after the interests of an undefended prisoner.

2610. (*Chairman.*) What do you consider to be his power in the Court? Has he the power of controlling the Court in any way?—I consider that his decision upon any point of law or practice ought to be final.

2611. But only upon those points?—Not upon the result of the evidence, nor upon the magnitude of the punishment.

2612. Do you consider that if there were differences of opinion in the Court as to the mode of putting a question, that would rest with the Court to decide or with the Deputy Judge Advocate?—With the Deputy Judge Advocate.

2613. That is merely a point of practice and not of law?—I think it is very often a point of law.

2614. But supposing that the mode of putting a question was not strictly against law but against the practice of courts-martial, what would be his powers?—I think that under those circumstances the Deputy Judge Advocate would be the authority to decide.

2615. Supposing there was a dispute as to the mode of putting a question in the court, should you rule in favour of the Deputy Judge Advocate or of the President of the court-martial, and should the Deputy Judge Advocate interfere *proprio motu* to stop evidence which was being taken contrary to the rules of evidence?—I should say that the Deputy Judge Advocate was the person to decide as to the reception of evidence, and I think that it is the duty of the Deputy Judge Advocate, if any improper question is put, to interfere and say that that question ought not to be put.

2616. Do you understand that the Deputy Judge Advocate has power under what you just now read to address the Court?—I consider it to be his duty to address the court after the case is over, and to sum up the evidence.

2617. Then you would not, in accordance with the recommendation of the last witness, suggest that it should be the duty of the President of a court-martial to sum up the evidence?—No; I think that the Deputy Judge Advocate should sum up. I rather considered that the last witness referred to the Deputy Judge Advocate. There is no doubt that it is the duty of the Deputy Judge Advocate to sum up and not of the President.

2618. Has it always been the case, according to your observation, that the Deputy Judge Advocate has summed up?—I cannot say, for I have not been present, but since these regulations have been in force it has always been his duty so to do.

2619. You could not say whether that duty has always been performed?—I cannot say whether it has always been performed, but I have no doubt that the duty has been sometimes performed. It is a matter on which there is no doubt. The regulation is in these terms: "That at the conclusion of the case he "will sum up the evidence and give his opinion upon "the legal bearing of the case before the court pro-"ceeds to deliberate upon its finding." I do not think that it is a matter upon which there is any doubt, and so far as I know the practice is in accordance with the regulation.

2620. (*Capt. Vivian.*) Are the Deputy Judge Advocates selected from officers upon full pay by the recommendation of the Commander-in-Chief?—I do not think I could state that to be the practice. Whether those gentlemen were upon full pay at the time they were appointed or not, I could not say at this moment, nor do I say that they are selected on the recommendation of the Commander-in-Chief. I say that as a matter of fact in the case of the first appointments there was no particular officer of whom I had any special knowledge as regards fitness for this duty, and I took those gentlemen who were, in point of fact, recommended by the Commander-in-Chief; but I do not wish it to be at all understood that that is a permanent rule, and on the falling in of those appointments I am not prepared to say that the Judge Advocate-General should not at once re-appoint upon his own responsibility.

2621. So that in fact you know nothing about the legal qualifications of these officers for the important posts which they were going to fill, except what the Commander-in-Chief said of them?—I knew nothing more of them than what I heard from that quarter, and from communicating with them personally.

2622. They have responsible duties to perform, have they not?—They have.

2623. They have to advise the court as to points of law, and with regard to the receipt and rejection of evidence, and they should be officers well versed in martial law, should they not?—Certainly.

2624. Do you think it advisable that the selection should be confined entirely to officers of the army?—I think that it would be contrary to the feeling of the profession to do otherwise; but I do not know that there is any absolute necessity that it should be so. I think that if anybody other than a military man were appointed it would cause a considerable amount of dissatisfaction in the army, but I cannot give any other reason.

2625. Do you not think that it would increase the confidence both of the court and of the prisoner with regard to the legality of the proceedings if they knew that they were being advised by a man who was fully conversant with all the intricacies of the law?—I think that it would be found rather difficult to get anybody to accept an appointment as a permanent Deputy Judge Advocate out of the army, who would at the same time give the same degree of confidence.

Right Hon. T. E. Headlam.

4 May 1868.

2626. That would be a question of payment, I suppose?—If you made the payment large enough, I have no doubt you would get gentlemen from any profession whatever.

2627. (*Lt.-Gen. Eyre.*) But is it not quite in the power of officers to qualify themselves for such an appointment?—There is no reason that I know of why they should not do so.

2628. Might they not do so very easily?—I do not know that it would be very easily done, because it would require a good deal of attention. There is no fatal objection to it; but I should wish to call the attention of the Commission to the 5th resolution, which is: "That the officiating Judge Advocate at a general "court-martial should represent the Judge Advocate-"General, should be deputed by him, and if possible "be selected either from officers who have passed "an examination in military law, or from barristers, "it being understood that when counsel are employed, "either for the defence or for the prosecution, "the officiating Judge Advocate should be a "barrister." So that these resolutions do provide for the case of a barrister being appointed a Deputy Judge Advocate for any very difficult case. If I were simply considering my own view upon the subject with respect to a very difficult and delicate case, I should like the Deputy Judge Advocate to be a man of great legal ability; and, in a case of that kind, if I were considering my own views upon the subject, I should not object to counsel being admitted on either side, and I think that if you admit the counsel to address the court, then you should have the court guided and assisted by counsel, or else you arrive at the evils which always exist when a court is inferior in power to the counsel who are practising before it; and, consequently, there is a difficulty in letting counsel address the court, and examine and cross-examine witnesses, unless you give the court a barrister also, to assist their judgment; but, in a very difficult and important case, I should like the court to be so constituted that a trial might as closely as possible resemble a great civil trial. The only objection to that is that it is against the feelings of the service, but I cannot say at this moment that I think there is any fatal objection to it. The Deputy Judge Advocates have done their work very well, and I should not like to make an alteration of that kind which would be distasteful to the army.

2629. (*Capt. Vivian.*) Have you any reason for saying that such an alteration as I have suggested would be distasteful in the service?—I think that the evidence which we have had before the Commission would be sufficient to show that.

2630. You fully admit and appreciate the importance of the position of those three gentlemen who are Deputy Judge Advocates?—Yes.

2631. And you think that they should be selected, whether from military rank or from civil rank for their knowledge of the law?—Yes.

2632. That is to say that if they had not that knowledge then their occupation is a failure?—If they are ignorant men of course it would be so. They might acquire their knowledge after their appointment, but the better the men you can get the better it is no doubt.

2633. An officer to make himself thoroughly qualified for so important a post would have to study hard, and to pass a very severe examination in the law, would he not?—Yes. I drew out a scheme of what I considered to be the proper books for an officer to read to qualify himself for duties of that kind.

2634. And you would recommend than an officer filling the post of Deputy Judge Advocate should pass a high legal examination?—I think so.

2635. (*Chairman.*) With regard to the conduct of cases in military tribunals, have you any suggestions to make with regard to the mode of prosecution before general courts-martial?—No; except as I have said that in a case of importance, I should not at all object to counsel being employed and addressing the court. With respect to inferior cases I do not think I have any suggestion to make other than that I think that the prosecutor should not be a witness in the case; but nothing else occurs to me at present.

2636. Have you had many cases brought to your notice in which prosecutor has been a witness?—I would not be certain, but I think it is not unfrequent. Sometimes he has only giving formal evidence. With respect to general courts-martial, I may say that a delicate question arises out of the time which intervenes between the decision of the court and the promulgation of the sentence. I do not see how that evil can be altogether obviated. I think it of great consequence that the Sovereign for the time being should exercise a personal superintendence over courts-martial, and so long as the Sovereign does exercise that personal superintendence, there must necessarily be an interval, but I think that the evil of that may be entirely obliterated, or made practically of no consequence. In the first place I understand that now the practice is that in case of acquittal the man is discharged within a very short time, that the matter is submitted to the Queen without a direct audience, and the consequence is that the man is discharged at once. Supposing a man to be found guilty, I do not see any reason why he should not be transferred at once to a military prison, and why the time should not count as part of his sentence, the only difference being that he should not be subject to anything more than confinement until the sentence was promulgated. It would be really for the benefit of the man, because he would get a certain portion of his sentence without hard labour. If that were done, and if the sentences were promulgated immediately after they were submitted to Her Majesty, then I think that the evils would be reduced to within a very small compass; but so long as the general courts-martial are submitted to the revision of the Sovereign, there must necessarily be an interval of some degree between the trial and the promulgation of the sentence.

2637. At present can a man who has been found guilty be given the punishment awarded to him until the sentence is confirmed?—He is kept in confinement, but there is no hard labour if he is sentenced to it, and he has the advantage that the time counts towards his sentence. There is no doubt that it is an inconvenient mode of imprisonment, and his being kept in the lock-up house, gives a great deal of trouble.

2638. (*Capt. Vivian.*) Do you see any reason why a court-martial should not, when they acquit a prisoner, at once announce the acquittal?—That would interfere to a certain degree with the theory of the Sovereign confirming every sentence.

2639. Do you think that so very valuable, that you would absolutely put an innocent man to the unjust infliction of perhaps 10 or 12 days imprisonment for the mere sake of keeping up this theory?—The decision of the court is not complete until it has been before the confirming authority whoever it may be.

2640. But with regard to naval courts-martial that is not so?—No, because the Crown does not confirm naval courts-martial.

2641. Therefore the only reason that you can give for maintaining this difference between military courts-martial and naval courts-martial is the necessity for upholding the prerogative of the Crown?—It is not accurate to say that it is the prerogative of the Crown, because it arises under the Mutiny Act; but it arises undoubtedly from the fact that the decision of the court is not complete until it has been confirmed by the confirming authority and the authority of the Queen arises under the Mutiny Act in the same manner as the authority of the confirming officer in other cases.

2692. (*Lt.-Gen. Eyre.*) Could the prisoner be under a kind of arrest at large as it is called?—I think it would be inconvenient, I think that the present system by which a man who is acquitted is released after some very short interval is the best one.

A man when he is convicted is handed over to the military prison authorities, and I do not see any serious evil in the present state of things subject to the man's going to a military prison.

2643. (*Capt. Vivian.*) Men are very often under the present system from circumstances which are frequently occurring, kept nine and ten days after they are acquitted, are they not?—I understand not.

2644. (*Mr. Whitbread.*) Do you think it desirable that the power should be retained of sending back a finding of acquittal for revision?—I think so.

2545. (*Capt. Vivian.*) On what grounds?—It is rather different with respect to general courts-martial but with respect to district courts-martial I do not think that where there is no Deputy Judge Advocate the court carries with it quite sufficient weight to make it advisable that there should be no power of revision afterwards.

2646. Would it not in your opinion be better to strengthen the court than to have a court so constituted that you cannot trust to its verdict of acquittal?—If you have on a district court-martial somebody in the sort of position of the Deputy Judge Advocate attending a court of that kind. I am not sure that then you might not leave it to the court without any revising assistance; but as it is at the present moment when the court has no assistance of that kind I should not be prepared to recommend that the decision of the court should be absolutely final.

2647. (*Chairman.*) Is there anything which you have to say especially with regard to regimental courts-martial?—No, I do not know so much about regimental courts-martial, because they do not come before me; but I agree with the view which has been taken by several witnesses, that it would be a good thing if the power of the commanding officer were rather increased; and I should not be sorry if regimental courts-martial were abolished. I very much doubt whether it is a good thing for discipline that something like an independent court should be formed within the regiment. I think it sometimes places both the commanding officer and the regimental court-martial in a false position towards one another; but as to whether it could be done or not I should not like to express a strong opinion.

2648. Do you understand the law to be now that a soldier, if he is dissatisfied with the punishment awarded to him by his commanding officer, can only appeal to a regimental court-martial?—I have not looked into that point, but I think that he can only appeal to a regimental court-martial.

2649. Do you think it advisable to extend that power to district courts-martial?—I do not think that it is material. I do not think that a man would ever appeal to a district court-martial.

2650. (*Lt.-Gen. Eyre.*) Would it make a difference in your view if the regimental court was conducted as it is now, but if the colonel should not hold the confirmation in his hand, but if it should go to a higher authority?—I think that there would be a difficulty about it.

2651. (*Mr. Whitbread.*) Do you agree with the last witness, that it would be desirable to abandon that power which the confirming officer now has of sending back the finding of a court-martial with a view to ensure a severer sentence?—I do not attach any great value to it, but I think on the whole that I should not be disposed to recommend the abolition of it. I have constantly had complaints made of the different magnitudes of punishment inflicted for the same crime by different courts-martial. You could scarcely have the punishments equalized (which is desirable, if possible) without some power in the revising officer to level upwards as well as to level downwards, and I have never seen in practice a case in which I thought any harm was done by the commanding officer sending back the punishment for consideration. I have known several cases where a commanding officer has sent back a sentence, and frequently the court have adhered to the sentence, and in some cases they have raised the sentence; but I never saw an instance in which I thought they raised it improperly. When it has been so, a sentence given has been decidedly below the average, and not sufficient according to the ordinary rules of the service.

2652. (*Chairman.*) Have you any other observations to make?—With respect to the writing down of questions, I consider it of very great consequence that there should be a complete record of the proceedings, because I do not know any other mode in which you could check great irregularities. Of course it is desirable to save trouble; and, therefore, with respect to the merely formal questions there is not the least reason why a printed form should not be drawn up which would save the trouble of writing down each of those questions, but I consider it to be of great importance that the record should be complete.

2653. (*Capt. Vivian.*) Why should it not be done by a shorthand-writer?—There is not the slightest reason why it should not. I think that is the best way, but the only objection to having a shorthand-writer is the expense, and sometimes the difficulty possibly in a remote region of getting a shorthand-writer. I do not see that it is necessary that the present practice should be adhered to of reading the question before it is put. It should be taken down by somebody, but there is no necessity for every question being submitted beforehand to the president to consider whether it is a proper question or not. But not only should every question that is put be written down, but it is of still greater consequence that every question which is refused should be recorded. I think that a great many more serious irregularities arise from the refusal of questions than from the putting of questions.

2654. (*Chairman.*) Have you had many instances before you in which you have had to decide that questions were irregular?—I have had more cases where evil has arisen from the refusal of questions, particularly in India, in cases where the practice of the stoppage of cross-examinations has been very serious, and I have had to upset courts-martial on the ground that the questions which the prisoner was clearly entitled to have put had been refused, and that produces a great denial of justice. The mere form of the question is not of very great importance, it is not sufficient to invalidate a regimental court-martial, although it is a thing to be made the subject of comment.

2655. In your office has it ever occurred to you to receive any remonstrances from the public against your decisions?—I cannot say that I ever recollect a case of the kind.

Adjourned to Thursday next at 12 o'clock.

Room E., House of Lords.

Thursday, 7th May 1868.

PRESENT:

COLONEL WILSON PATTEN.
VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
MAJOR-GENERAL SIR ALFRED HASTINGS HORSFORD, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
CAPTAIN THE HON. J. C. W. VIVIAN.
SAMUEL WHITBREAD, ESQ.
JOHN LLOYD WHARTON, ESQ., *Secretary.*

VERNON LUSHINGTON, ESQ., recalled and further examined.

V. Lushington, Esq.

7 May 1868.

2656. (*Chairman.*) The Commission understand that you wish to add something to your former evidence; will you proceed to make any statement that you may consider desirable?—On the former occasion I was asked whether I had any suggestions to contribute, and I was anxious before I mentioned any suggestions that I should put myself in a right position by saying that generally speaking cases brought before courts-martial are so plain that the court can hardly go wrong; and I was also desirous to explain my deference as a civilian in expressing an opinion upon matters in which military considerations are of great consequence.

2657. Applying those remarks to the constitution of courts-martial, have you anything to add to your former evidence upon that point?—In the first place, with regard to some questions which were asked me, I think chiefly by the Recorder of London, as to the position of the Deputy Judge Advocate, I desire to say that I think the essential difficulty of the case lies in the fact that courts-martial have to administer law, and at the same time the court is composed of military officers who are not acquainted with law. It is important to state that, because I know that many officers have expressed a strong opinion that courts-martial ought not to administer law, but that they ought to be courts of honour. You will see that expressed in the clearest and most resolute manner by the late Sir Charles Napier in his very interesting book upon military punishments. Therefore, the first thing is to front that difficulty, as it seems to me that a court-martial, being a military tribunal, has to administer law, and the problem then is how best to furnish such a military tribunal with legal assistance.

2658. How do you propose to do that?—At present, so far as my experience furnishes a guide to me, I am well satisfied, as regards the constitution of the court, with the position of the Deputy Judge Advocate as a legal adviser to the court. He is attached to the Judge Advocate-General's office; he has many opportunities of communicating with the Judge Advocate-General and his Deputy upon matters of law. He also pays great attention to the military law and practice respecting courts-martial; he is also in cases of difficulty assisted by a barrister. Then when the trial takes place he sits at the right hand of the President and counsels him whenever legal difficulties arise. I can understand that it is a very real objection to say that on a trial by court-martial now there is a dual authority, namely, that of the President of the court and that of the Deputy Judge Advocate. In practice I do not believe the objection often becomes serious, but you will observe what is the alternative if you do not have a Deputy Judge Advocate as the legal adviser of the court; either the court must have no legal adviser, which raises, and must raise, a very great difficulty, or else the court must have the assistance of a barrister directly. Now I do not think that the direct assistance of a barrister would be consonant with the views generally entertained by military officers. I think, therefore, that the present system furnishes legal assistance to the court both with respect to civil and to military law in the manner which is most acceptable to the military tribunals.

2659. (*Capt. Vivian.*) Are you speaking of general courts-martial?—I am.

2660. (*Chairman.*) Seeing that you approve of such an arrangement on general courts-martial, do you see any means of applying that, even in a modified form, to either district courts-martial or regimental courts-martial?—I do not at present, unless in the military service there was established a corps of officers trained in military law, as exists in some armies, I believe in the Russian army and in the Prussian army; but of course I speak from very imperfect knowledge as to that; but I can conceive that a number of officers might be trained in military law and the law of courts-martial generally; and in that case it would be very proper to appoint one of those officers to every district court-martial; but I should hardly think it necessary to have a legal adviser in cases of regimental courts-martial.

2661. Would you suggest that certain officers of every regiment should be so far instructed in military law that they should themselves be able to take the place of the Deputy Judge Advocate on district or regimental courts-martial?—I should not like to offer an opinion upon that. Of course it would in the abstract be advisable, but there must be more important duties for officers to master, and there might be difficulties in making the arrangements for their education.

2662. (*Viscount Eversley.*) I understand you to say that you would have a Deputy Judge Advocate on district courts-martial as well as on general courts-martial?—It would have its advantages.

2663. Having a Deputy Judge Advocate should his decision upon points of law be final, or would you allow the majority of the court to decide?—I think that the present arrangement is perhaps the best,—a direction that his opinion ought to be conclusive without making it absolutely authoritatively conclusive. It is very difficult to say that the President should be, as to matters of law, bound by the opinion of the Deputy Judge Advocate, because the President and the court are the persons appointed to try the prisoner; but I think that the greatest deference, and practically complete deference, should be paid by the President and the officers of the court to the opinion of the Deputy Judge Advocate.

2664. (*Lt.-Gen. Scarlett.*) Then you would have that Deputy Judge Advocate of a certain rank, I suppose, and educated in a certain manner, because you could hardly expect a captain who might be appointed as Deputy Judge Advocate to give the law to a colonel of a regiment who was the President?—Quite so. I am at present confining my observations to general courts-martial; I am not prepared to offer any substantive proposal with respect to district and regimental courts-martial. It is perhaps necessary to insist with military officers that all courts-martial have to administer law; it is obviously so, I think, when it is fully considered.

2665. (*Chairman.*) You do not recommend, as I understand, that the Deputy Judge Advocate should act as President of the court-martial?—I think that proposal deserves consideration.

2666. But supposing that was the case, and sup-

posing that the Deputy Judge Advocate was a field officer, and the officer to be tried was a superior officer, what would be your view?—I think that would not do. I think in that case you must appoint a President of superior rank to the prisoner. In ordinary cases I don't see why the Deputy Judge Advocate should not be the president; but I only say that I think that is a suggestion which well deserves the consideration of the Commission.

2667. Would there not be some inconvenience in the Deputy Judge Advocate being the President of the court with a superior officer sitting at his side?—Yes; but then the Deputy Judge Advocate is now generally a full colonel, and probably that would be sufficient for almost all general courts-martial, or, at any rate, for all general courts-martial held upon private soldiers.

2668. Supposing that the office of Deputy Judge Advocate was made more extensive than it is at the present moment, should you think it desirable that the officers holding that position should all be of high rank in the army?—I do not quite understand what you mean by making the office more extensive.

2669. Supposing that it should be recommended that a Deputy Judge Advocate should attend district courts-martial, in your opinion would it be necessary that that Deputy Judge Advocate should be of so high a rank as you have just described?—I think you would not find the system work, unless he was a colonel, because in the case of a district court-martial you generally have a person of the rank of lieutenant-colonel as President.

2670. (*Lt.-Gen. Eyre.*) He would, in point of fact, be a fixed President?—Yes; I think that is a suggestion well worthy of the consideration of the Commission. There is one difficulty, I think, attaching to that. At present the Deputy Judge Advocate in difficult cases has the assistance of a barrister, and, if he was President of a court, I do not think he could so conveniently do that. At present you do in effect provide the court with legal advice; you have the Deputy Judge Advocate as adviser on military law; you have him assisted if necessary by counsel; and you have all legal points presented to the court in a manner which I think is agreeable to them.

2671. (*Capt. Vivian.*) Have you ever turned your attention to the question whether or not it would be advisable to establish fixed military courts, composed as they are now, but with a fixed judicial President, such as you describe, as Deputy Judge Advocate, well versed in law, to try all cases brought before them?—I have not sufficiently considered that point.

2672. Have you considered whether or not in different districts there should be fixed military courts composed of military officers sitting in permanence with a judicial head to try all cases brought before them?—I have not sufficiently considered that; but of course the present idea of the system is, that every officer should be qualified to sit upon a court-martial, and you would lose the benefit of that if you had a fixed court.

2673. (*Lt.-Gen. Eyre.*) The fixed courts in some continental armies are composed of a president for the year, and part of the members for six months, and the others for three months, so that there is a change occasionally. How do you view that?—I think that seems rather preferable to a court consisting entirely of fixed members.

2674. (*Capt. Vivian.*) My idea was not that the absolute members should be sitting in permanence, but that the court should be established with such a change as General Eyre now proposes,—that it should be a fixed court, the principal feature of which would be that the presiding genius of the court, so to speak, would be a man well versed in law?—I dare say that you would get some of your cases better tried in that way, but at the same time I think you would lose the education of the officers in very important matters.

2675. (*Maj.-Gen. Horsford.*) But it is the unattached services on which most of our army is always employed, only a small part of the army being occupied in England, and the officers would lose all opportunities of knowing what they might have to do in an isolated position?—No doubt.

V. Lushington, Esq.

7 May 1868.

2676. (*Lt.-Gen. Eyre.*) If such a system were established it would be necessary to have the officers sitting as supernumeraries sometimes, would it not?—I should think so.

2677. (*Chairman.*) In the performance of your duties have you ever received any complaints of the mode in which courts-martial are conducted?—From time to time.

2678. Have those complaints been numerous?—I should say they have been very far from numerous, compared with the number of trials; but still the principal work of the office of course is to review errors, or suggestions of errors, in the proceedings of courts-martial.

2679. But I refer rather to complaints of the mode in which courts-martial have been conducted?—We do receive complaints from time to time, certainly, but general complaints are very rare. Of course nobody is in a position, except an officer of very high rank in command, to make any general complaint. We always have to deal with particular cases, but occasionally a correspondence is sent to us, perhaps from the Horse Guards, in which the views of military officers in high command appear in a more general form.

2680. Has an officer under trial any power at all of individually making any remonstrance or statement to the Judge Advocate-General upon the mode in which his case has been conducted?—In my opinion he has not. In my opinion the Judge Advocate-General is the adviser of the military authorities, and if any officer, whether under trial or not, has a complaint to make, he makes his complaint to his military superior, which complaint, we will say, is finally transmitted to the Commander-in-Chief. The Commander-in-Chief desires to be advised on the law, and he sends on the documents, including the original complaint of the officer, to the Judge Advocate-General for his opinion; but I do not think that the Judge Advocate-General has any original jurisdiction, so to speak, in the matter. He is simply an adviser called in by the supreme military authority.

2681. But my question had this object: to ascertain whether a prisoner under trial has the power of laying the case as he sees it before the Judge Advocate-General, either directly or through any other quarter?—He has that power in the indirect manner which I have mentioned. He would probably in his complaint request that the matter should be laid before the Judge Advocate-General; but it would come to us from the military authorities. I do not mean to say that we have not as a matter of fact occasionally received complaints direct, but I do not think it is usual to answer them directly, and you would see at once that it would be quite inconsistent with military discipline that we should do so.

2682. Are the cases numerous in which such communications have come to you from the officer under trial through the Commander-in-Chief?—The case of an officer being tried, as you are aware, is really a rare case. We have complaints from men who have been tried sent from time to time to us from the military authorities, but they bear quite an infinitesimal proportion to the number of cases tried. Those, however, are of course the cases which furnish work to the office.

2683. Do you think that the present system of the preparation of charges in the Judge Advocate-General's office is one which it is desirable to continue, or have you any alteration to suggest?—I see the objection to the present system plainly.

2684. What is that objection?—That, in the case of a general court-martial held in this country, the Judge Advocate-General settles the charges and in that respect performs the work of a prosecutor, and then afterwards, if a question arises as to the validity of the charges, he is the person to whose opinion the question is finally referred, so that he then acts as Judge, having previously acted as prosecutor. But I am not

V. Lushington, Esq.

7 May 1868.

prepared at present to offer any remedial suggestion. If any other officer can be appointed in whom the Commander-in-Chief would have sufficient confidence to prepare the charges, that of course would be an improvement, but it is rather difficult to suggest who that officer should be, because it should be an officer well versed in criminal law, and also well versed in the ordinary criminal law of the army. The Commander-in-Chief must have the very best of advice on these points, or otherwise justice may miscarry in very serious cases. Then another difficulty in making any alteration is this: that the same difficulty presents itself everywhere, in every colonial command for instance, and in India, so that you would have to provide an officer in each place to prepare the charges. I think it is a matter, if I may say so, which is well worthy of the consideration of the Commission, but I am not myself prepared positively to recommend any alteration.

2685. (*Lt.-Gen. Scarlett.*) That would entail a number of appointments and a very considerable expense, would it not?—It would entail a considerable expense and with only occasional work. I think on the whole you will find that you must trust to the impartial conduct of the Judge Advocate-General in the matter, although it is rather a difficult position for him to fill.

2686. (*Chairman.*) I believe that there is this difference between a trial before a court-martial and a trial in criminal courts, that if in the criminal court a prisoner pleads guilty his plea is admitted at once without going into the case?—That is the case.

2687. That is not so I believe in courts-martial?—No. By a paragraph in the Queen's Regulations in such cases the court is required to take evidence on oath in the usual manner.

2688. Can you give any reason why there should be a difference between a court-martial and an ordinary court in that respect?—The reason of that regulation is that the revising officer may have the means of fully judging of the circumstances of the case; but that does not seem to me to make it necessary. I myself think that it would be as convenient if the same practice were followed as is followed in the ordinary criminal courts, viz., that where the prisoner pleads guilty, a statement should be made by the prosecutor as to the circumstances of the case.

2689. Is it the case that in a criminal court the prosecutor makes a statement in court if the prisoner pleads guilty?—Yes, that is the ordinary practice. The prisoner pleads guilty, and then the court requires to be informed of the nature of the case. Of course it has the depositions also, but the counsel for the prosecution speaks.

2690. (*Lt.-Gen. Scarlett.*) The punishment is awarded according to the evidence in a court-martial, is it not?—Quite so; it is awarded upon the charge and the evidence.

2691. As explained by the evidence?—Quite so.

2692. (*Mr. Headlam.*) Is it not the case in trials before the civil tribunal that no witnesses are sworn when the prisoner pleads guilty?—No one is sworn then.

2693. Is not the real difference that in a civil case witnesses are sworn, and that in a military trial witnesses are not sworn?—Quite so.

2694. (*Capt. Vivian.*) But in a civil court they have the depositions before them, whereas in the military court they have nothing at all?—Yes. I do not wish to press for an assimilation of the practice of courts-martial to that of the civil courts, but I do not myself like the present position with respect to the plea of guilty, because no one can say exactly what the meaning of the plea of guilty is. In a civil court the plea of guilty is conclusive, and no evidence whatever is required; but in a court-martial you are required to take evidence, and then the question continually comes up to us whether under the circumstances the finding of guilty which follows and the sentence can be justified. There is some flaw in the evidence—then what is the value of the plea of guilty? We have nothing to guide us.

2695. Have you ever known a case where a prisoner has pleaded guilty, and then has been acquitted on the evidence?—Certainly; but it is not a very common thing. It more commonly happens the other way; a man pleads guilty and evidence is taken, and the court finds him guilty, and then our opinion is taken as to whether the court have done right in finding the man guilty. If the plea of guilty is enough, what do you want the evidence for? If it is not enough, then must you not take evidence to precisely the same extent as in an ordinary case?

2696. Have you ever known an instance of a soldier pleading guilty for some object when he has not been guilty?—Yes; in cases of desertion.

2697. You think that soldiers are in the habit of pleading guilty to one crime which they have not committed for the purpose of escaping punishment for another which they have committed?—I do not think it is a common case.

2698. But does it ever happen?—I have no doubt that they sometimes plead guilty when they are not guilty.

2699. Have you ever had a case of that kind brought home?—I think so, certainly. There was one instance which was quoted before the Commission the other day of a man who was tried for making a false and frivolous complaint to his commanding officer.

2700. But you think that it is not confined to one instance, but that there are several instances where a soldier has pleaded guilty when he is not really guilty?—There are some such instances; but the purport of my present observation is this: that neither the court, nor the confirming officer, nor the Judge Advocate-General can say at present what really is the legal effect of the plea of guilty; whether it is enough in itself to justify the finding of guilty, or whether any, and if so how much, evidence is required in order to confirm the plea.

2701. Have you sufficient experience of the criminal law to be able to point out any difficulty which has arisen before the civil tribunals from the plea of guilty being taken by the court as a matter of course?—I should say that it was a very reasonable system to act upon the plea of guilty; but at the same time, I know that some persons are of opinion that in all cases the crime should be proved.

2702. (*Capt. Vivian.*) Do you suggest, then, that the same practice should prevail in military courts as now prevails in the civil courts with regard to the plea of guilty?—What I should prefer would be, that in all cases the plea of not guilty should be entered, and that evidence should be taken, and then I think the soldier, when he is called upon for his defence, may admit his guilt with any expression of contrition which he may think fit. That, I think, would really be a better plan; but after all it is not a matter of great importance, and I only wished to mention the subject, because it is one on which we occasionally have difficulty, inasmuch as neither the court, nor the confirming officer, nor ourselves can lay down any clear rule with respect to the effect of the plea of guilty.

2703. (*Maj.-Gen. Horsford.*) Would you ask the question whether the prisoner is guilty or not guilty?—I would not; I do not see any advantage in it. That question very often involves difficulties both of law and of fact.

2704. (*Lt.-Gen. Scarlett.*) Have you known any cases where men have pleaded guilty, and where the evidence has not been sufficient to confirm their guilt?—Certainly.

2705. And where, if they had not pleaded guilty, they would have been acquitted?—Upon that evidence, certainly.

2706. (*Chairman.*) Can a prisoner before a military tribunal put forward any other plea than that of guilty, or not guilty?—It is supposed that he may plead in bar of trial.

2707. Is that quite decided?—I have never known a man escape a trial by pleading or trying to plead in bar of trial; but I think I have seen frivolous attempts made sometimes in order to bar trial. I should myself propose that no pleas in bar of trial should be allowed. I believe that, in the ordinary criminal law, there are three pleas in bar of trial, *autrefois acquit*, *autrefois convict*, and *pardon*.

2708. What is the plea of pardon?—If a man proves pardon by the Crown. It is very inconvenient to enter into proof, certainly, of either of the two first pleas, because to show that a man has been either acquitted or convicted on a former occasion, you must show that that charge was the very charge for which he is now going to be tried, and that may be a matter of extreme difficulty, and may involve your necessarily going into all the circumstances of the case.

2709. In the case of a second trial for habitual drunkenness, would you deprive a man of the power of saying that one of those cases of drunkenness came under consideration at a former trial?—Not at all. I think that he ought to be allowed to say it, and to prove it; and, if he proves it, I think the court ought to acquit him of the principal charge.

2710. But he would put that forward in bar of the present trial, would he not?—He might, I suppose.

2711. Why should he not do so?—For this reason, that in order to prove that plea in bar of trial he probably would have to show precisely what is the matter for which he is brought to trial on the present occasion, which may involve his going into evidence on the whole case. I think that it would be better to try a man and let him state anything he likes and prove anything he likes, not manifestly irrelevant, in his defence; and let that be taken into consideration by the court and by the revising officer.

2712. You do not think that a prisoner would be deprived of a material circumstance in his favour by the course you suggest?—I think not, because I would allow him to state it and to prove it.

2713. Is the plea in bar of trial a frequent one?—Not at all; but at present it furnishes an opportunity for embarrassing the court. I have an instance in my mind, in which the prisoner I think put forward six or seven reasons at least why he should not be tried, not one of which was a good one. It is very difficult for a court-martial, a military tribunal, to judge of matters of that kind.

2714. On a former occasion you gave evidence with regard to the mode of conducting the prosecution, and you gave an opinion with regard to counsel being permitted to address the courts-martial; do you wish to add anything to the observations which you then made?—At present you are aware that counsel are permitted to be present, assisting both prosecutor and the prisoner with their advice; for instance, they may suggest what questions shall be asked; they may suggest objections to be taken to any question; or they may suggest the grounds of argument upon which questions may be maintained, all of which at present is done in writing. What the counsel, in fact, wishes to say is put in writing by the prosecutor, or by the prisoner, and is then submitted to the court. I know that there is a very great objection to a counsel's voice being heard in a court-martial, and at present it is not allowed; but speaking as a civilian with great deference to military experience and military conviction, I myself think that it would be better that in the few cases where counsel do appear, they should be allowed to do their work just as they do in other courts. In a great case like Colonel Crawley's case, or Captain Jervis's case, counsel are present doing their utmost to embarrass the court and put them into difficulties, and yet, at the same time, by not permitting them to speak, you really do deprive both the prisoner and the court of most valuable assistance which counsel may give. I am not aware of any objection that has been raised to counsel being allowed to speak in the ordinary manner, except the suggestion that a counsel for the prisoner will prejudice a court against a prisoner; but I do not think that ought to be so. Of course a prisoner might suffer occasionally by an indiscreet line being taken by his counsel, but there ought not, I think, to be any prejudice against a man simply because he has a counsel, and I think practically there would not be any. At present you have the counsel there, and you put into his hands, if he is counsel for the prisoner, power to embarrass and perplex the court; and by the system which you adopt you require all this to be done in a very cumbrous and tedious and round-about manner; whereas if the counsel was speaking in the ordinary direct manner, I think you would get his assistance in the best and most convenient way, and I do not think that you would really find that it would at all impeach the military character of the tribunal.

2715. I suppose that admitting counsel to act in courts-martial as they do in the civil courts would tend very materially to lengthen the proceedings?—I think not.

2716. Not if a counsel is allowed to address the court?—I think not; I think it would greatly shorten the proceedings. No doubt there is a great difference between a case where a man is not defended by counsel and one where he is defended by counsel; the latter takes the longer time, but where the prisoner is defended by counsel I think the trial would be more expeditious if the counsel were allowed to address the court in the ordinary manner than if everything was to be done in writing according to the present system. One of the great delays which at present occur on an important trial is the delay which is granted for the preparation of written addresses.

2717. But supposing a regiment is quartered in a district where the prisoner has not the means of getting any but very second-rate counsel or a solicitor on his behalf; would not that solicitor, being totally unacquainted with the nature of the court, be likely to lengthen the proceedings?—Very slightly, I think. Take the ordinary case in which a private is tried for stealing; if he employed a solicitor, that could not lengthen out the case very much

2718. (*Capt. Vivian.*) The legal adviser is allowed to be present now, is he not?—He is.

2719. And, therefore, so far as delaying the proceedings of the court is concerned, he has every opportunity of delaying them now?—Yes; and much more than he would otherwise have.

2720. Would you confine this privilege to general courts-martial?—No, I would allow any prisoner to be defended by counsel.

2721. Either before a general, a district, or a regimental court-martial?—Yes, before any court-martial, I think.

2722. With regard to the written questions, would you recommend that all questions should be taken in writing under those circumstances as they now are?—I am very strongly against that; I really see no essential advantage in it.

2723. (*Chairman.*) You stated in your former evidence that you thought that where a shorthand writer was employed the taking down of the questions and answers by the president or by the Deputy Judge Advocate was unnecessary; would you make any further remark on that point?—Yes, I will now take the case in which no shorthand writer is present; I think I described to the Commission on the former occasion what the present practice is, viz., that everything is done in writing. The prosecutor's question has to be written out by the prosecutor; it is submitted to the president, and is by the president then written down and recorded in the proceedings; it is then put by the president to the witness. That is the ordinary practice at present. You must see that a great deal of time is consumed by that process. Now I cannot see why it should not be sufficient for the president to take just such a note of the proceedings as is now taken by a careful judge, that is to say, that instead of recording the question and answer, he should always record only the answer of the witness, except in cases where the question was of a

V. Lushington, Esq.

7 May 1868.

peculiar kind requiring to be specially recorded. I can understand the objection that may be taken to this course: it is, that first of all the officers who preside at courts-martials are not always very experienced men in trying cases, and that their duty in recording the proceedings ought to be as simple as possible. But I don't think although that is to some extent true that their inexperience would be found of nearly as much consequence there as with respect to the graver functions which they have to perform in trials. It is not a difficult thing after all to take a tolerably good note of evidence. Secondly, I think that the revising officer does not really require extreme minuteness of detail in the evidence; he requires of course the substance of the evidence, and in cases where the exact words used are material, he requires the exact words, but, generally speaking, what I would call photographic minuteness is not needed for the purpose of revising the proceedings of a court-martial. I think, therefore, it would be altogether better if the record of the proceedings of the court were something more nearly corresponding to a judge's note elsewhere; it seems to be the natural course, and I should think it would be the most convenient one. It is a great objection to the present system of courts-martial, as it seems to me, that the whole process is so tedious. A judge's attention ought to be always on the quick, and if the process is tedious I do not think the work can be so well done. Then this must be said, that even at present under the very strict rules for recording the evidence you do not have an exact account of what took place. Nobody can supply that except a shorthand writer.

2724. In the Judge Advocate-General's office have any cases occurred which lead you to suggest any alterations in the power of the revising officer?—On the whole I am not prepared to make any suggestion with respect to that. I think that the revising officer ought to be very forbearing in calling upon the court to reconsider their finding upon a question of fact, because if the court are not competent in the first instance to do that, I do not think they ever will be competent. But it appears to me that it is very convenient that the revising officer should be able to call upon them to reconsider their finding upon a question of law, and that he also should have the power of moderating their sentence. The delay thereby occasioned is very trifling, and in that way you get the advantage of the judgment of a superior officer who has the command of a large body of troops in the district, and who thereby brings the sentences more or less to a uniform and equable character.

2725. (*Capt. Vivian.*) But you would not allow the court to be re-assembled for the purpose of increasing the punishment?—I do not object to it.

2726. (*Mr. Whitbread.*) You used the word "moderating" instead of "mitigating" just now, did you not?—Yes, but I did not intend it to have that meaning exclusively. I do not see any objection to the revising officer in certain cases re-assembling the court for the purpose of increasing the punishment. Of course the revising officer exercises a severe power of that kind with considerable reluctance, but it is not at all an uncommon thing to see it done.

2727. (*Maj.-Gen. Horsford.*) He would give his reasons in full, would he not?—Yes. A revising officer on those occasions, I think, makes generally some remark in his minute, such as, "This is a very serious crime," and that he considers the punishment inadequate, and he requests the court to reconsider their sentence.

2728. (*Mr. Whitbread.*) Do you go so far in your opinion as to approve of sending back a finding of acquittal?—I said just now that I think the revising officer ought to be extremely reluctant to ask the court to re-consider their finding on a mere question of fact. The finding sometimes involves a question of law, and if the revising officer has reason to think that the court has gone wrong on the question of law, of course he will at once send it back. An instance occurred the other day, where an act was charged to be done, we will say, on the 9th of December. The evidence proved the act to have been done upon the 8th of December. The court acquitted the man, and the revising officer wrote to us to know what he should do. We recommended him to re-assemble the court, and to inform them that the error in the charge as to the date was not material, if the prisoner was not thereby prejudiced in his defence.

2729. Would you recommend a similar proceeding to a court which had the assistance of a Deputy Judge Advocate upon the questions of law which might come before it?—Yes, I should do so. I should say that made a difference in degree, but not in kind. It is very rarely indeed that a general court-martial is re-assembled in England.

2730. (*Chairman.*) It has been suggested that all the proceedings of district courts-martial should be sent to the Deputy Judge Advocate of the district for examination before they are confirmed, in the same way as the proceedings of general courts-martial are sent to the Judge Advocate-General; have you any opinion to offer upon that point?—Yes, I have a very strong opinion that it would be advisable that the proceedings in all cases should be revised by the Deputy Judge Advocate of the district before they are submitted to the confirming officer for his confirmation, because thereby mistakes may be set right in time. That is the course which is adopted in India. I believe that all cases there go to the Deputy Judge Advocate of the district, and I believe that practice also prevails in Manchester, but otherwise it is not the case. The Commission will see the importance of that with respect to the foreign courts-martial. We do not get those until months after the man has been tried, and of course all we can do is, either to advise that part of the punishment should be remitted or that the whole of the proceedings must be quashed; but it would have been a great advantage if, before the confirming officer had confirmed the proceedings, they had been submitted to the opinion of the Deputy Judge Advocate, who would have had brought to his notice any mistakes which might have been made, and he might then have ordered the court to be re-assembled, and the whole thing might have been put right, instead of a miscarriage of justice taking place.

2731. But would it be possible always to do that in India?—I believe it is invariably the case.

2732. And you suggest that it should be done in the same way in England.—In England, and also I would say in the colonies. There is no standing Deputy Judge Advocate in most of the colonial commands, and I should suggest that it would be very advisable to appoint an officer, if not with that title, at any rate with that duty. At present, as the Commission are doubtless aware, what is done is this, that the proceedings come in to the confirming officer, they are then read by an officer on his staff, I do not know that any one is specially detailed to do it, and the general officer then writes his confirming minute.

2733. (*Lt.-Gen. Scarlett.*) The general officer reads them himself?—No doubt he does, but at the same time he has other very important duties to do, and to some extent a general officer must trust his subordinates in matters of such minute detail as the revision of the proceedings of courts-martial necessarily involves. I think it would be well to have an officer specially charged with that duty.

2734. (*Chairman.*) At the same time it appears by former evidence that there is some little complaint of the delay which takes place between the sentence and the confirmation of the sentence; would not that increase that inconvenience?—Yes, there would be some delay, but I think there would be a very slight delay.

2735. How are the Deputy Judge Advocates generally situated in England for instance?—Colonel Laye resides in London, Colonel Meir resides in Manchester, and Colonel Nugent resides in Dublin. I should say a day's post would always be quite enough.

2736. But would not the consideration of the finding require some time?—I think it would very seldom require more than a day's post.

2737. And thence it would have to go to the confirming officer, would it not?—Yes; and he would make his confirming minute.

2738. Have you any knowledge of the average time that it requires for the finding of a court-martial to be confirmed by the revising officer in the case of district courts-martial in England?—That is rather a difficult question to answer. Sometimes the proceedings are confirmed on the same day, and sometimes two or three days afterwards.

2739. In case it takes two or three days, is it not natural to suppose that the same time would be required by the Deputy Judge Advocate?—I think not. I see a great number of those proceedings, and I think it would be a very unusual instance in the case of a district court-martial in which I could not give my opinion the same day.

2740. Then it would appear that at the present time the proceedings come to be submitted to the Judge Advocate-General after they have been confirmed and promulgated?—Yes; and sometimes months afterwards, after everything has been done, and even after the sentence has been entirely carried out.

2741. And you think that it is desirable that that stage should be gone through before the confirmation takes place?—I do. I think the best proof that can be given of its advantage is that it has been tried with success in India for some time. I remember that Sir Sidney Cotton once when he was commanding in Manchester came and asked me whether the same thing could not be done here in England, and he spoke with great approbation of the system in India, and I believe he it was who introduced the same system at Manchester.

2742. (*Capt. Vivian.*) Does that system prevail now?—It prevails at Manchester, I believe, at the present time.

2743. (*Chairman.*) But the commanding officer at Manchester is commanding over a very large district of country; he commands at York for instance. Would a court-martial held at York be sent to the Deputy Judge Advocate of that district previously to going to Manchester?—I believe so.

2744. Do you know where the Deputy Judge Advocate of the northern district resides?—In Manchester.

2745. (*Capt. Vivian.*) Do you see any reason why a sentence of acquittal should not be pronounced at once before it goes to the revising officer or to the confirming officer, supposing the prisoner is tried upon a charge and acquitted?—I should have no great objection to that. I think there would be a few rare cases, such as those which I have mentioned, in which the acquittal is wrong, and in which upon the suggestion of the revising officer a more correct finding might be come to by the court, but there are very few such cases, and I think they may be disregarded, if necessary.

2746. You think they might be disregarded in consideration of the great injustice that would sometimes be done in keeping the prisoner for some time confined?—Quite so.

2747. (*Chairman.*) I understand that you wish to make some further observations with regard to the constitution of courts-martial for the trial of officers. Will you proceed to make those observations?—I think it right to say that I have seen official complaints by some officers in high command that it is difficult to get courts-martial to do their duties quite satisfactorily when an officer is on his trial. Of course there are few persons really in a position to form an opinion upon such an important matter; but I speak now from what I have seen stated by Sir William Mansfield in a minute, and also from some remarks made by Lord Strathnairn when Commander-in-Chief in India; you will also see it very fully instanced in the life of Sir Charles Napier, written by his brother.

2748. Are those minutes to which you allude minutes which have come into the Judge Advocate-General's office officially?—The way in which the matter came before me was this, there was a minute of Sir William Mansfield which came before us officially, and attached to this minute were the observations of Sir Hugh Rose, I think, in the case of two or three general courts-martial held in India.

2749. What was the nature of those observations to which you allude?—It was simply this, that officers were not willing to do their duty towards an officer on trial with the same strictness as towards a private soldier, and great complaints were made by those general officers whom I have mentioned.

2750. (*Mr. Mowbray.*) That letter of Sir William Mansfield's was written after the verdict in a particular case, was it not?—It may have been so, but I do not think it made any special reference to that case.

2751. (*Capt. Vivian.*) Did Sir Hugh Rose confirm those remarks of Sir William Mansfield's?—Sir Hugh Rose's remarks were before Sir William Mansfield's. You will see the matter enlarged upon in Sir Charles Napier's life, and I think that there was a general order by Sir Hugh Rose; but I cannot pledge myself to that, because it is some time ago since I read the minute.

2752. (*Chairman.*) Do you recollect what was the nature of the order?—I believe it was a general order complaining of the manner in which courts-martial declined to act with due severity in the case of officers under trial.

2753. Did it apply generally, or to one particular instance?—It applied to several instances.

2754. Did it state any particulars?—There were several instances quoted. There was one which made an impression on my mind as I read it, which was the case of an officer who was tried for offering an insult to some Mahomedans in some mosque, I think at Cairo; but however, there were several cases, and Sir William Mansfield concluded with a suggestion that courts-martial for the trial of officers should consist only of officers considerably senior in rank to the accused.

2755. But that would be in opposition to the practice of military courts in every part of the world, would it not?—I cannot say that.

2756. You do not know the constitution of military courts in other countries?—No, or very imperfectly indeed.

2757. You are not aware that England is the only country in which the rank of the officers composing the court must be equal to that of the person tried?—I was not aware of it.

2758. Do you not think that it would have rather a bad effect to go in the opposite direction to that?—I think that it is essentially a military question, and I do not myself offer any opinion upon it. As regards the doctrine of condonation, perhaps I may be permitted to say that I think that that sometimes occasions great embarrassment. The old doctrine, which probably arose from active service in the field, was that when a man who was under a charge was put to perform any duty, such performance of duty by permission of superior authority absolutely condoned his offence. That has been to some degree limited, and in the present edition of the Queen's Regulations a considerable change has been made in that respect, at any rate as to private soldiers. It is now held that putting a man to duty shall not absolutely condone the offence, but shall be recorded in the proceedings if the prisoner chooses, and shall be taken into account by the court and by the revising officer; but the difficulty still remains with respect to officers, and the question often arises: What amounts to condonation? What kind of service or permitted service really frees the prisoner from liability to trial and punishment?

2759. But at the present moment there are only two cases, are there, the one being absolute condonation and the other being ordered to perform some duty; is there any other mode of condonation except those

V. Lushington, Esq.

7th May 1868.

two?—It is a most peculiar doctrine, and it belongs to the military service only. I believe it does not exist in the naval service; they cannot afford to have such a doctrine there, because if an officer has misconducted himself, he must nevertheless do his duty; you cannot supply his place on the high seas.

2760. (*Lt.-Gen. Eyre.*) Can you see any sense, or use in that doctrine?—I think not; I can quite understand that if a man has fought a battle for you, you ought not to try him afterwards; but I do not like its being an absolute doctrine that the performance of any duty after an offence is committed should be a condonation of the offence.

2761. (*Chairman.*) Could you point out, either in the Articles of War or in the Queen's Regulations, where that doctrine is laid down?—It is No. 349 of the Queen's Regulations, at page 84, "A soldier charged "with committing an offence should be put in con- "finement as directed by the Articles of War, and ought "not to be permitted to perform any duty whatever "(except carrying his own arms and accoutrements "in marching) until his case is disposed of. If, "however, by error such an offender has been per- "mitted to perform any duty, he shall not thereby be "absolved from liability to punishment for his "offence; but may, if the proper authority shall "think fit, be summarily punished or be brought to "trial before a court-martial according to the circum- "stances of the case."

2762. But that meets your case, does it not?—It does as to private soldiers; but I think you will see that it does not apply in terms to officers.

2763. But is the doctrine applied to officers?—The doctrine of condonation generally is certainly applied to officers.

2764. Invariably?—Invariably.

2765. Is the being ordered to perform an act of duty on the part of an officer considered as condonation?—It is considered as condonation.

2766. (*Mr. Headlam.*) The performance of the most trifling duty would be the most complete condonation for the greatest crime?—It might almost be stated so.

2767. (*Lt.-Gen. Peel.*) Is that the only order which refers to this condonation?—That is the only order; but the condonation itself, I think, rests upon the ancient custom of the service, and I imagine it arose from this, that in active service, when a man had misbehaved himself, if an action was imminent, you required his services, you let him out and he fought for you, and after that it was thought to be hard and improper to bring him to trial.

2768. Do you suppose that that passage in the Regulations would apply to officers?—That would be rather a stretch of it; but it might possibly be applied to them.

The witness withdrew.

WILLIAM GEORGE GRANVILLE VENABLES VERNON HARCOURT, Esq., one of Her Majesty's Counsel, called in and examined.

W.G.G.V.V. Harcourt, Esq.

2769. (*Chairman.*) You have had some experience with regard to courts-martial, have you not?—My experience is limited to one particular instance, which was the court-martial, with which the Commission are probably familiar, upon Colonel Crawley. That was a court-martial which perhaps may be considered more or less an exceptional court-martial no doubt, because it was a court-martial I suppose which was the result of a want of public confidence in the general system of courts-martial, and it was a sort of court-martial upon a court-martial as it were, which was conducted, I suppose, for the purpose of carrying on, more or less under the supervision of public opinion, a court-martial because the public thought that they had some reason to distrust the system under which courts-martial were conducted; and in that respect perhaps it was an exceptional transaction. That is the only case with which I am familiar.

2770. I believe it lasted for some time, did it not?—It lasted for several weeks and many days.

2771. And you, I believe, were the legal adviser of the prisoner?—I was so.

2772. In the course of advising upon that case, did any suggestions occur to you which you could make for the alteration of the present system of courts-martial?—In answer to that question I may say that certainly some of the objections which are popularly urged against courts-martial seem to me to be unfounded. I thought that the system of conducting proceedings before courts-martial was far less open to objection than I had supposed. There is a popular prejudice, no doubt, against the process of questions being delivered in writing, and I, with a good many other people, shared the opinion that it would be quite impossible to elicit evidence and to conduct cross-examination by that process. I certainly did not find that at all. It no doubt took a longer time than would have been taken under ordinary circumstances, but it seemed to me in a considerable degree to be a protection to a court which is not versed, as the courts of Westminster Hall are, in the laws of evidence; because it is quite plain that the court might be very much at the mercy of the legal advisers on either side. In the courts in Westminster Hall we know very well that if a counsel asks a question which is improper he will be stopped at once by the judge; but that is a thing which with an unlearned court would not occur to the same extent; therefore I did not feel the weight of that objection; but there were other objections in that court-martial which I did feel very strongly. The form of taking evidence did not seem to me to be so objectionable as I had supposed.

2773. Do you think that the present system of putting down the questions in writing is a favourable one for the prisoner, and that it affords any more protection to him than an examination *vivâ voce*?—I do not know that my opinion would apply to that at all. It seems to me that it is some protection to an inexperienced tribunal against improper questions being put; that is to say, that the court have time to consider before the words have escaped whether or not the question which is propounded is one which ought to be put; but subject to what I propose presently to say with reference to that, I think there might be alterations made which would do away with the necessity of any such regulation.

2774. (*Lt.-Gen. Peel.*) That was a general court-martial, was it not?—It was a general court-martial.

2775. Was there somebody present from the Judge Advocate-General's office on that occasion?—Yes; the circumstances were very peculiar in that case.

2776. A question being submitted in writing to the president of the court, he submitted it, did he not, to the Judge Advocate before it was decided whether it was a proper question or not?—I forget whether he always did so, but he certainly did so sometimes.

2777. The protection is to the court in fact, is it not?—It is to the court.

2778. The court is protected by the question being written, because they have an opportunity of submitting that question to the Judge Advocate before they decide whether it shall be read or not?—No doubt that is so.

2779. (*Lt.-Gen. Scarlett.*) But do you think it a protection not only to the court, but to the prisoner?—It may operate in either way. The improper question might be either for or against the prisoner. It is giving time, in point of fact, for the court to consider; a time which is not necessary where you have an experienced tribunal.

2780. (*Mr. Mowbray.*) It is also giving time for the witness to consider his answer, is it not?—The witness is not acquainted with the question until it is propounded.

2781. But the time which is occupied in framing the question gives time to the witness to consider what his answer may be for one question?—No doubt, from the bearing of the previous question.

2782. (*Capt. Vivian.*) In the case of a prevaricating witness under cross-examination, the delay might be inconvenient, might it not?—No doubt; you cannot follow him up with the same rapidity as in a court of common law, but practically I do not think that I found much disadvantage from that.

2783. (*Chairman.*) You do not attach much importance to that?—I do not attach much importance to it. With regard to that court-martial there was what I supposed was an extraordinary practice, but which having referred to it I must notice, in order that it might never happen again. The gallant General has asked me whether the questions were referred to the Judge Advocate to be approved. The Deputy Judge Advocate was a military person and not a legal person; but the Deputy Judge Advocate-General, who was a legal person, was acting in that case as adviser of the prosecution. Now I imagine that that was quite an exceptional case, but that seems to me to be a proceeding contrary, so far as I understand, to the first notions of justice, because if any question arose as between the prisoner and the court as to the propriety of a question being put, or as to evidence, the person who was advising the prosecution was a member of the same department which had to decide finally upon the evidence. It was as if in a prosecution by the Crown the Attorney-General was the Judge, while the Solicitor-General was the prosecutor, and as if the Solicitor-General having put a question to which the prisoner's counsel objected it was to be referred to the Attorney-General to decide whether the question ought or ought not to be put. That was what actually occurred in that court-martial. I do not know whether that is the general practice of courts-martial, but it seemed to me to be a violation of the first principles of justice.

2784. Will you describe to the Commission what part the Deputy Judge Advocate and the Deputy Judge Advocate-General took in that court-martial?—I take it that it was a very anomalous transaction altogether. There was an acting Judge Advocate, who was Colonel Pipon, who was nominal adviser of the court.

2785. Where did he sit?—He sat by the president. Then there was a nominal prosecutor, a gallant general who is on this Commission. Then there was the real prosecutor.

2786. Where did the Deputy Judge Advocate-General sit?—The Deputy Judge Advocate-General was in point of fact the adviser of the prosecution, the nominal prosecutor being General Sir Alfred Horsford; the Deputy Judge Advocate-General was advising him, and then when any question arose between the prisoner and the prosecutor, the prosecutor was advised by the Deputy Judge Advocate-General, and the ultimate decision of the question at issue was referred to the Judge Advocate-General, who was the final adviser of the court-martial as to whether or not the question should be put. Therefore in point of fact the prisoner was placed at this disadvantage, that the Deputy Judge Advocate-General advising the prosecutor had, as his ultimate court of appeal between him and the prisoner, the Judge Advocate-General, who in point of fact did advise (on one occasion certainly, if not on more than one occasion,) against the prisoner and in support of the Deputy Judge Advocate-General, who was advising the prosecution; that is to say in point of fact the parties advising the prosecution were the ultimate court of appeal between the prosecutor and the prisoner.

2787. Will you state who framed the charges on that occasion?—I cannot say personally. The charges were framed in the Judge Advocate-General's office. The Deputy Judge Advocate-General was the practical prosecutor, and for all legal questions the Judge Advocate-General was the judge, and a more extraordinary confusion, according to legal ideas of the relations between a prosecution and the parties who were to judge of the prosecution I cannot conceive.

2788. You were retained by the prisoner, I understand?—I do not believe that that would be a correct military phrase. I was "the prisoner's legal friend;" I believe that is the proper phrase.

2789. Had you the power on his behalf to raise the objections which you now raise to the Commission?—No, I could raise nothing of course. What I did was to object to a question, or I proposed to put a question, and then the prosecutor objected to my question, or insisted on his own. Then I knew that the decision upon those objections was to be referred to the very department who were conducting the prosecution.

2790. But my question had a different object; at any part of those proceedings do you hold that you had not the power to raise that objection which you have just now urged to this Commission, viz., that the duties of the Deputy Judge Advocate-General and of the Judge Advocate-General clashed?—I do not see how I could have raised it. There was no legal form in which I could have raised it. We felt the pressure of it extremely, and we felt that the form in which the trial was conducted was an extreme hardship upon the prisoner, but I would not say for one single moment that it was not dealt with with the greatest fairness.

2791. (*Lt.-Gen. Peel.*) But could not the prisoner have raised the objection upon your advice at the time?—I do not see in what form it could have been done. Who would have decided upon the objection? The Judge Advocate-General?

2792. The question is not who would have decided it, but as to raising the objection. Could not the prisoner, upon your advice, have objected to certain questions being put?—Yes, I proposed to put a question and then the prosecution objected to that question. Then the court, not feeling themselves competent to decide between us as to whether the question could be legally put or not, referred the question, as I understood, to the Judge-Advocate General.

2793. (*Chairman.*) That, however, is not what you object to; what you object to is that the Deputy Judge Advocate-General should have had a voice in the transaction at all, is it not?—No doubt. If the Judge Advocate-General was to be the deciding party, it certainly was very unfair upon the prisoner that the Deputy Judge Advocate-General should be the party acting against him.

2794. (*Capt. Vivian.*) Did the prisoner raise any formal objection to this?—There was no chance of raising a formal objection. I should have thought that it would have been an act of great indiscretion on my part to have advised the prisoner to have done that which would have borne the character of an act of insubordination. The highest authorities at the Horse Guards, and I suppose at the Judge Advocate-General's office, had determined that a particular course should be adopted, and I did not feel myself justified in saying more than just pointing out the remarkable nature of the proceedings. But I cannot remember whether or not prisoner did so in his reply.

2795. (*Lt.-Gen. Peel.*) What I understand you to object to is this: that practically the Deputy Judge Advocate-General, being the adviser of the prosecution, and they having recommended him to put a question, and that question being objected to, he had to decide finally whether or not it was a proper question?—He did not decide personally, but the department in which he was acting did so.

2796. (*Lt.-Gen. Scarlett.*) If the prosecutor's adviser had not been connected with the Judge Advocate-General's Office, you would not have objected to him in any way, would you?—No, it would have removed that part of my objection altogether. Of course I should have thought it an extremely inconvenient thing that a criminal tribunal should be administering justice without somebody present on the spot who would be competent to advise the tribunal. I think that it is very inconvenient that you should have a tribunal adminishing justice without somebody present

W.G.G.V.V. Harcourt, Esq.

7 May 1868.

whose decisions should be immediate and final upon questions of evidence.

2797. (*Mr. Whitbread.*) You felt that your position was this, that the practice of the prosecutor and the court being both advised from the same department was not contrary to the practice and regulations of the service, and that therefore you had no rule or law to appeal to if you had started the objection?—I did not know whether it was so or not, as it was my first experience of courts-martial, but it certainly militated extremely against everything that I had learned everywhere else.

2798. (*Chairman.*) You stated, did you not, that the Deputy Judge Advocate-General was the adviser of the prosecution?—He was.

2799. Did you make the objection that on that court-martial the Deputy Judge Advocate-General was acting contrary to the Queen's Regulations in appearing as adviser to the prosecution?—No; if it had been against the Queen's Regulations I should have felt, of course, that I might have taken the objection; but he did not nominally appear as Deputy Judge Advocate, though in fact he was so, and though, as we knew perfectly well, he was, and must have been, in constant and daily communication with the Judge Advocate-General's Department; and therefore it signified extremely little what he was called. He was in point of fact the Deputy Judge Advocate-General; he was the person who got up the case for the prosecution, and who got up the evidence in that department which was to be the ultimate judge of the propriety of the decision of the court.

2800. Are you aware that since that court-martial to which you have alluded the Queen's Regulations have been so altered that at the present time the Deputy Judge Advocate is directed to maintain an entirely impartial position, and to act only as the adviser of the court?—That may be so; but I do not think that affects the case at all, because the Deputy Judge Advocate-General did not appear in the official position of Deputy Judge Advocate, and therefore he would not have been touched by that regulation. But as a matter of fact he was Deputy Judge Advocate-General; and there is another objection still stronger than the one which I have stated, which is this, that in that case the evidence for the prosecution was got up in the Judge Advocate-General's department (I shall be corrected if I am mistaken in that), and I believe that the witnesses for the prosecution were examined in the Judge Advocate-General's Office in the department which was in the final result to be the judge as to the propriety of the sentence. That seemed to me to be a confusion of jurisdictions which I was entirely unable to comprehend. It would be as if the prosecution which has recently taken place of the Fenians had been got up by the Lord Chief Justice of England; as if in the Lord Chief Justice's rooms the witnesses had been examined and their depositions taken down by a Judge of the Court of Queen's Bench; and as if finally the Court of Queen's Bench were to have been the judges of the propriety of the verdict of the jury and of the sentence which they themselves had passed. I do not know whether that is what is called "the custom of war," but it is certainly not the practice of Westminster Hall.

2801. I understand you that this regulation to which I have just alluded is not sufficient to meet the case?—You will probably hear from the present Judge Advocate-General, and from the gallant general who was the nominal prosecutor on that court-martial, that that would not have touched the case, because the adviser of the prosecution appeared there, though he was the Deputy Judge Advocate-General, and though he had got up the evidence himself in the Judge Advocate-General's office, not as Deputy Judge Advocate, but as what I may call the private legal adviser of the prosecution.

2802. (*Mr. Whitbread.*) But would you not raise the point at once upon that regulation if you saw a man appearing not as himself but in another capacity?—Perhaps I may be allowed to say that this was much too ticklish a case, especially in the earlier part of it, for me to have raised an objection as to jurisdiction. If it had been the most valid objection in the world I would not have raised it.

2803. (*Lt.-Gen. Peel.*) I understand you to say that the prosecution had a perfect right to have the assistance of a legal adviser?—Yes.

2804. But that what you object to was that that legal adviser was the Deputy Judge Advocate-General?—No doubt.

2805. But he was not recognized by the court at all in his official capacity as Deputy Judge Advocate-General; in case of any legal objection the court did not refer it to him to decide, did they?—That may have been so, but the court knew very well that he was the man who was ultimately to overrule them.

2806. By his ultimate decision, but not by his decision given in the court at the time when an objection was raised?—No; but the difficulty was that supposing that the court had decided against him they knew that he or his department were the parties who might afterwards overrule their decision because they had decided against him. The Judge Advocate-General had the power of pronouncing upon the validity of the court-martial or otherwise, and yet the very man against whom they would have decided was the man who was ultimately to sit in judgment upon the point.

2807. I am not, as you well know, justifying the appearance of the Deputy Judge Advocate-General in that case; but was it not the case that he was not recognized as appearing there in his official capacity?—He was not officially recognized, but privately, of course, the fact that he was Deputy Judge Advocate-General had, and must have had, a very powerful influence upon the action of the court.

2808. (*Lt.-Gen. Scarlett.*) But in fact, was not another officer appointed as Deputy Judge Advocate?—Yes; but I think that the gallant general, who was the nominal prosecutor, will fully bear me out in saying that in all questions which affected law or evidence the legal advisers on both sides were practically allowed to fight it out, and I may, perhaps, be allowed to say that every disposition was shown on the part of the legal advisers on both sides to remove, as far as possible, all difficulties from the court; and I am sure that the gallant general will bear me out in saying that we constantly retired privately with the court for the purpose, as far as possible, of settling questions without dispute, and that the acting Judge Advocate present did not, as a fact, take any part in deciding questions which were in issue upon the evdence. With the permission of the Commission, I may say that I take it that one of the things which led to that court-martial was, that in a case which had attracted public attention there was a want of public confidence in the system of administration of justice by courts-martial; that might be a well founded or an ill founded opinion, but there is no doubt that what caused that court-martial was that for various reasons there was a want of confidence in the manner in which courts-martial were administered, and that, no doubt, is exhibited also by the system of courts-martial altogether, because it seems a very strange thing that you should have a court sitting, and that you should say that the sentence of that court shall not be carried out until it has been subsequently revised. That seems a much more inconvenient mode than having established some system by which confidence may be given in the administration of justice at the time that justice is so administered, because a man in the position of Judge Advocate-General may naturally when he looks at the proceedings and sees considerable irregularities say, "there are irregularities which if "anybody had been there who understood the laws of "evidence would not have occurred; but it is a "very serious thing to reverse this sentence, which "may perhaps on the whole be right;" and he has a natural disinclination to do that. But on the other hand people who may be dissatisfied with the decision

lay their fingers on those blots which unquestionably occurred, and they say, "The whole thing is wrong, "because you see so and so was allowed to be said, "and another thing was allowed to be done which "would be allowed to be done in no other court "in the country." The consequence is that public opinion is shaken upon the whole transactions, and confidence is not given to tribunals which do not administer justice upon the principles with which the public are familiar.

2809. (*Chairman.*) But I think you said that you yourself were agreeably surprised with the constitution of the court-martial?—You must take that with this fact, that it was a very exceptional court-martial. There were lawyers on each side, and practically speaking that court-martial was pretty nearly administered like a trial in Westminster Hall, and I should imagine (though I have not of course personal experience) totally differently from what ordinarily takes place at courts-martial. In point of fact that court-martial was so held because people had not confidence in the system of the previous courts-martial to which it referred. What seems to me to be the great object to be gained is to establish some system which will give public confidence in the administration of justice by courts-martial, which I do not think they at present possess. It may be an unjust impression, but at all events it is an impression which very widely maintains that justice is not administered by courts-martial in the same manner as it is in the other tribunals of the country.

2810. (*Lt.-Gen. Peel.*) Do you suppose that that want of confidence extends to the military officers themselves, or that it is only confined to the public?—Of course as to military officers themselves I am very unfit to give an opinion upon that subject, but it seems to me to be of the first consequence that confidence should be given to the public in the administration of justice on courts-martial for two reasons: first of all, as I think the right hon. and gallant general's own illustration once given was, "those who "pay the piper have a right to call the tune;" and therefore they have some right to have something to say in the matter. But a still more important question (and that is one which lay I think very much at the foundation of the Crawley court-martial) is, that so long as the public have no confidence in the administration of military justice, your enlistment will very much suffer; and as long as it is supposed that injustice is possible in the administration of your military tribunals, where you have a voluntary army dependent absolutely upon public opinion, the foundation of your army really subsisting upon your satisfying public opinion, you must satisfy public opinion that your military system is a just one. The first thing that seems to me to be necessary in the administration of justice is that the laws of evidence should be regarded. I know a great many people think that the laws of evidence are technical things, but that is not so at all. The laws of evidence are nothing more nor less than the rules of discovering what tends to moral proof. Now I do not understand how it is possible that justice can be done by people who do not understand what are the things which tend to prove guilt or to prove innocence; and what are those things which ought to be eliminated and abandoned as not proving them; and a tribunal which is ignorant of the laws of evidence seems to me to be incapable of administering justice. I know there is a popular notion that you can arrive by the light of nature and common sense at the laws of evidence, but that is not so. You might just as well say you might arrive by the light of nature at the manner of manœuvring an army. I think that if we lawyers endeavoured to handle an army of 100,000 men we should be in about the same situation as a board of officers who were endeavouring to administer the laws of evidence in a criminal trial; and I think the results are pretty much the same. I believe it is a military expression that you get an army "clubbed," if you get it into inextricable confusion; and I think that, generally speaking, a military tribunal gets the evidence pretty well "clubbed" before they have done with it, and that the result is eminently unsatisfactory.

2811. (*Chairman.*) But is not the law of evidence one of the most difficult studies in your profession?—That is perfectly true.

2812. And it is one with which lawyers have the greatest difficulty in contending in their education for the bar, is it not?—No doubt; and with which most of them are least acquainted.

2813. But seeing that these cases must be tried by military tribunals and not sent to a civil tribunal, how would you suggest that the laws of evidence should be strictly enforced in a court-martial?—First of all I start with this proposition, without, I do not say a pedantic observance of particular laws of evidence, but without a general and thorough knowledge and observance of the laws of evidence, the administration of justice is impossible. Then I say that if you are are going to satisfy public opinion as to the justice of your military tribunals you must satisfy them that justice is administered upon the fundamental principles of the laws of evidence. Therefore I say that whatever cost and whatever trouble it puts you to you must secure that object. I would have a legal assessor to the court. It is as you have said a thing that requires a great deal of study, and what is still more important a great deal of practice, to know the laws of evidence, and I would have a man of experience and practice to advise, I will not say on small matters of discipline, but on all important questions in general courts-martial. I would have a legal assessor to advise the court, and according to my own impression I would have no legal adviser, either of the prisoner or of the prosecutor. It seems to me that I would leave them to tell their own story in their own way. If you give the court the protection of a legal adviser to show them that they are conducting the case properly, and to show the public (which is equally important) that they are conducting the proceedings according to the known and recognized principles of evidence, then I am not quite sure that you might not dispense altogether with the office of Judge Advocate-General. It seems to me that then you would have accomplished at the time that which in a very much more imperfect way you accomplish afterwards, that is to say instead of having a bad trial to be revised subsequently by the Judge Advocate-General you have a good trial. In point of fact you would then be doing at the same time the very same thing which you are now doing afterwards by a very clumsy process, which throws discredit on the court by reversing its sentence if it is irregular; you are at the same time giving confidence to everybody in the court; you will raise the character of the court in the estimation of everybody, and you will give what is very often of great importance, immediate effect to the sentence, because then there is no reason why the sentence should be reserved to be reviewed; and you will save the court-martial from the humiliation to which they are constantly exposed of being turned back like a boy at school, because he does not know his lesson.

2814. But would not your suggestion involve this: that in the case of a private soldier being tried before a general court-martial, he would be under the disadvantage of having to confront men of much greater education and much greater talent than himself, without having any legal assistance whatever?—He would be in the position that every prisoner, one of Her Majesty's subjects, is in who is without counsel and he would receive I should suppose the same assistance that a civil prisoner receives under these circumstances from the judge who is trying him.

2815. But a prisoner in the civil court, though he is generally without counsel, always has the power of retaining counsel, has he not?—No doubt, but I say that he would be no worse off than a prisoner who is not retaining counsel. I do not wish in the least in in the world to introduce legal special pleading into courts-martial. I think that would be very injurious

W.G.G.V.V. Harcourt, Esq.

7 May 1868.

to the service in every possible way, and therefore I do not want to have two attorneys or two barristers, one on each side, raising all kinds of technical points for the court. I quite admit that military justice must be administered in a somewhat ruder way than that in which it is conducted in Westminster Hall; but at the same time I cannot admit that it is to be considered as dispensed altogether from the observance of the first principles of evidence, which it seems to me is much too often the case, and must always be the case, because, unless a man has been trained to it he does not know what is evidence and what is not.

2816. (*Lt.-Gen. Eyre.*) Do you confine your observations exclusively to general courts-martial?—I confine my observations exclusively to general courts-martial.

2817. (*Mr. Mowbray.*) Do you think that course of proceeding would give satisfaction to the public?—I do indeed, because why should you not have men advising courts-martial of the position and status in the profession of a recorder for instance? You would get just that class of men, who administer justice in all the towns of England. That is a matter of which of course I have not personally the means of speaking; but I should have thought that one or two or certainly three such persons would have been quite sufficient to advise all the courts-martial that take place in Great Britain. They might go a circuit; they would be sent for, not exactly like the hangman, but at all events when they were wanted; and then that would be perfectly sufficient for your home army. In the field you must make the laws of war of course prevail and there is nothing to be said there; but in your colonies you might make the Attorney General, or the Law officer of the Crown (whether it be in the Cape or the West India Islands or wherever you have a civil establishment, you have a lawyer) the ex officio adviser of a general court-martial, and cause him to be present there and in point of fact have him sit as assessor just as the Trinity brethren sit as assessors to the Judge of the Court of Admiralty, and expound to him the laws of navigation, of which the Judge of the Court of Admiralty is ignorant just as a court-martial is ignorant of the laws of evidence.

2818. Taking your own case of a recorder, in every case where a recorder presides there is a bar practising before him, is there not?—No doubt. I do not lay great stress on what I have said as to that. My own inclination I confess would have been subject to the legal advice of the assessor that I have spoken of to relieve the court from the somewhat technical kind of objections that lawyers, I am afraid, are sometimes disposed to make.

2819. But an illiterate person brought to trial at quarter sessions and charged with an offence knows that he can always avail himself of the assistance of a legal gentleman accustomed to the rules of evidence and able to cross-examine the witnesses who are brought to prove the case against him?—The reason why I say this is because, while I very much wish to conciliate public opinion towards courts-martial, I do not wish to see a system introduced which would rather irritate the military mind. I think if they found courts-martial were turned simply into courts of law, and if they had always lawyers coming in and turning it, in point of fact, into a sort of Westminster Hall, probably that would be (though I do not profess to be a good judge of that) disadvantageous to the discipline of the army.

2820. If the arguments which you are now using against prisoners tried by court-martial having the assistance of legal advisers be good, would they not be equally good against a bar appearing before a recorder or a bench of magistrates at quarter sessions?—You see you are introducing a new system; and therefore you judge of it accordingly. If we were to make such a rule with respect to the court of quarter sessions we should be taking away a thing to which people are accustomed; but I think that if you had the security that the court itself was guided by a person experienced in the laws of evidence, that would go a long way to reassure the public about the administration of justice, which I think is a very necessary thing, and on which I do not think confidence exists. I had the opportunity on that court-martial, I am happy to say, of making the acquaintance of a number of very distinguished officers, whom I have met very frequently since, and they have said: "We have nothing to do "with the laws of evidence in courts-martial, that is not "the thing." One of the most distinguished officers in the service said to me only the other night: "We "judge by the custom of war;" but I do not see what the custom of war has to say to the laws of evidence. If you choose to say, and if it is necessary for the purposes of military discipline that you should give the commanding officer an absolute and summary power, well and good; give it him and let him say: "I administer justice according to my own judgment." If that is necessary do it. But if you are to go through a form of trial, then it seems to me to be absolutely necessary that that trial should be conducted according to the laws of evidence. If it is inconsistent with your discipline to have a trial, do not have one; but if you are to have a trial, surely it ought to be conducted according to the strict principles of evidence. I mention that, because I know that there is a very strong feeling on the part of a great number of the military profession, that this would introduce something which is not essential, that it would be an entire revolution in the whole of their theory of the administration of justice; but that seems to me to be absolutely essential.

2821. Then do you really think it would be advisable to introduce into the trial of offences by military tribunals a system the very opposite to that which prevails in all other criminal courts in the country?—I do not say it is the opposite; on the contrary, I propose that it should be an assimilation to it as far as is compatible with the discipline of the army. If it is compatible with the discipline of the army and the opinion of military men that there should be counsel for the prosecution and counsel for the defence, then I do not say at all, as a lawyer, that I should not prefer it; but I have an impression on my mind that that would be introducing a litigious spirit which would certainly be very distasteful to the military profession, and possibly (though I am of course no judge of that) not advantageous to military discipline; but I say that I do not attach the same importance to that as I do attach to having the court itself competently advised on the principles of evidence. That is the thing to which I attach the main importance, and the other, I think, is a secondary matter.

2822. (*Lt.-Gen. Peel.*) Your proposal is to substitute for the Judge Advocate, who attends a general court-martial now, a legal assessor?—I would propose to substitute a legal assessor.

2823. Upon the ground that you think it would give greater confidence to the public in general that the court should be assisted by a person who is a better judge of the law of evidence than the Judge Advocate?—Yes; and I also hope and think that it would give greater confidence to the court, because a court may very often feel puzzled on such questions. Perhaps you will allow me to give an instance of that. On that court-martial, which consisted of certainly some of the most eminent men in the military profession, this question arose: there was a certain witness called to give evidence in favour of the character of Serjeant-Major Lilly, one of the charges in the case being that Serjeant-Major Lilly had been harshly and improperly treated; it was considered probably not strictly legally in issue whether Serjeant-Major Lilly had been a very well-conducted man who had been ill treated, or whether there were reasons for the conduct that had been pursued towards him. An officer was called to give a good character to Serjeant-Major Lilly, and that officer being called I advised the prisoner to ask a question which he considered to be of great importance, which was within the cognisance of that officer, and the court themselves *ex mero motu*, and not at the suggestion of the

prosecution, retired to consider this question, "Can a "witness who is called to character be cross-examined "generally?" Now that is a question which never could have suggested itself to the mind of anybody who had studied the laws of evidence. This man was not a witness called to character. They were misled as people who are not professionally educated will be misled, by a phrase. Of course he would have been a witness called to character if he had been called to the character of the prisoner; but this was upon a collateral issue, and of course there could be no such objection. The court retired, and they sent for the Deputy Judge Advocate-General and myself to ask what our opinion upon the subject was. I said, "I "am the junior, and I am quite sure that the Judge "Advocate-General will tell you the rule in that case." And of course he said, "There is no question that he "can be cross-examined generally." But supposing we had not wished to assist the court and had squabbled about it, how in the world was the court to decide such a question as that? It was quite obvious that they had not in their own minds a conception of the character or principles of the laws of evidence. That only shows how embarrassed a court may be which is not educated. They did not even know whether such a question as that could or could not be put, nor had they even an idea of the nature of the principles on which it was to be decided.

2824. Who was the Judge Advocate-General who was called in on that occasion, the one whose presence you objected to?—The Deputy Judge Advocate-General was acting with the prosecutor, and the court, knowing that we wished to keep the matter straight as well as we could, instead of conducting the discussion in open court, constantly retired into a private room with us, and they asked our opinion and we frankly gave it; and if in discussion between ourselves we thought the question might be safely withdrawn we withdrew it.

2825. Then he was so far recognized by the court as to be consulted on occasions of that kind?—He was consulted, not as Deputy Judge Advocate-General, but as the legal adviser of the prosecution. In fact the court said to us, "Tell us what we ought "to do." I say that is a position in which no court of justice ought to be placed.

2826. (*Mr. Mowbray.*) Your object, as I understand it, is to secure a more competent court?—My object is to secure a more competent court.

2827. I suppose you will admit that a judge of assize is a competent court?—I ought to do so.

2828. And yet it is not supposed that before a court so constituted a prisoner is not greatly benefited by being enabled to avail himself of the advice of a barrister?—Yes; I am not so very closely wedded to that opinion. I do not want to abolish barristers at all, but really I think you rather lay too much stress on what I have said. I only threw out, as an opinion, that it might be posible to dispense with it; at all events that it would be less necessary for the protection of the prisoner.

2829. Would it not be better to do both things, to render the court more competent and efficient, and at the same time to give the prisoner an opportunity of availing himself of what legal assistance he can procure?—If that is considered to be consistent with military discipline, I should say, certainly, yes; but on that subject of course I can give no opinion.

W.G.G.V.V. Harcourt, Esq.

7 May 1868.

2830. Is not that more likely at once to be more satisfactory to the public, and to conduce to the proper administration of justice?—As regards the satisfaction of the public, I think that so long as they are assured of the legal capacity of the court as to the law of evidence, they would be satisfied.

2831. (*Lt.-Gen. Eyre.*) Is there any reason that you know of why military officers might not qualify themselves for the legal duties to which you have referred instead of the Government having to employ civil practitioners?—My answer to that is this, that above all things the law of evidence is one which can only be learned by practice. The study of the law of evidence from books is necessarily extremely incomplete, and there is nothing in which in my judgment absolute practice is so essential as in the law of evidence.

2832. But, if it become a department of the staff, and officers were regularly educated for that special duty, might not that objection be obviated?—If officers would go to the bar and go sessions, then I should say so; but otherwise, how are they to get the practice? because their only practice would be before military tribunals. What I want is to have men who have practised before the the civil tribunals and have been drilled in the laws of evidence before the judges of the land, and who have had the sort of training that an English barrister gets when he goes sessions. That is the sort of practice that seems to me to be essential.

2833. (*Capt. Vivian.*) Have you ever considered how it would act if you had military courts-martial, composed as they are now of military officers with a legal head, in the nature, as you suggest, of a recorder to preside over the court-martial, and if those courts sat in districts in permanence, all cases being referred to them for trial, the members of that court changing at the pleasure of the general of the district, or of the Commander-in-Chief, from time to time, each of them before becoming members passing a certain examination in military law?—That is a question of military administration on which I do not feel competent to offer an opinion. All I want is that the court should have a legal adviser, and I would rather see the legal person the assessor of the court than the master of it. I wish always to ensure to the military profession the control of the court, just as in the Court of Admiralty you have the Trinity Brethren to advise on navigation, but the judge must always be the master of the court. I would certainly not give the primary control or the presidency of the court to a lawyer. My impression would be against that altogether, because I think that would shake the confidence of the army in the administration of courts-martial.

2834. (*Chairman.*) Did anything else occur to you in that trial which you wish to mention?—I think not.

The witness withdrew.

The Right Honourable THOMAS E. HEADLAM, a member of the Commission, further examined.

Right Hon. T. E. Headlam.

2835. (*Chairman.*) You desire to make an explanatory statement to the Commission, do you not?—Yes; I think, after what has been stated with respect to the trial of Colonel Crawley, that it is desirable for many reasons that the whole of the circumstances of that rather peculiar case, and the cause of the particular course which was then taken, should be stated. I quite agree with Mr. Harcourt that the case was an exceptional one. I also quite agree with him that the particular course which was then adopted, of the Deputy Judge Advocate-General advising the prosecution, is not one which ought to be or is the least likely to be adopted again; and I may say further that there are some special circumstances connected with that case which make it to me a matter of regret that, as it was so purely a matter of exception, allusion should have been made to it, and rendered it necessary for me to state fully the circumstances of the case. The facts were these: the case of course, as this Commission must be aware, was one of exceeding difficulty and complication. There arrived from India a very large number of witnesses of whose testimony nobody in this country was really cognizant. Under those circumstances the authorities at the Horse Guards applied for assistance to the Deputy Judge Advocate-General, and, whether, wisely or not, he gave assistance in arranging that evidence. I then, not knowing precisely what part he had taken in the

Right Hon. T. E. Headlam.

7 May 1868.

matter, strongly urged upon him to accept what I considered would be his natural duty, viz., that of acting as Deputy Judge Advocate at the trial. The same was pressed upon him by the authorities at the Horse Guards, but the Deputy Judge Advocate-General stated that, having been asked to do the work which he had done, he had found that, by degrees, without being aware of it, he had become to a certain extent mixed up with the prosecution; and that, therefore, there would be objections, not of a technical kind, but of a real kind, were he then to act as Deputy Judge Advocate at the trial. He stated that, both to me very strongly, and also I believe to His Royal Highness the Duke of Cambridge; and upon a statement of that kind from a person of his position of course I immediately abstained from pressing him further on the subject. I then did the best I could, which was to get the officer who I thought, from all the recommendations that I could get, was the best qualified to give confidence to the court, and to fill the office of Deputy Judge Advocate at the trial in the best possible mode. The officer selected was Colonel Pipon, and I have no hesitation in saying that no one could have been selected who was more fit to fill that place. Then came the question as to how the prosecution was to be conducted, and the prosecution was conducted by giving to a gallant officer behind me the duty of conducting the prosecution; and as the Deputy Judge Advocate-General had been assisting in getting up the evidence, I thought that it was far better, he having taken that part up to that time, that he should go on doing what he had done, and that the prosecution should then be conducted by General Horsford acting as the prosecutor before the court with the legal advice of the Deputy Judge Advocate-General continued in the same manner, and that the two things should be perfectly and entirely separate; and I acted as Judge Advocate-General, communicating with Colonel Pipon, who acted as Deputy Judge Advocate at the trial. It was not a course which I should have suggested, and I regret that it did take place; but that was the course which, under those circumstances, was considered to be the best, and I cannot say that there was any substantial objection to it, whatever there may have been in sound, because, as the prisoner was instructed, advised, and supported by a man in Mr. Harcourt's position, there was really no reason why General Horsford should not have been instructed, advised, and supported also by as able a man as we could get; and I have not the smallest doubt that in any of those conferences with the court the influence of Mr. Harcourt would weigh as much as that of the Deputy Judge Advocate-General, although he was undoubtedly connected with the particular office which I held. The part which I had to take in the case was really very small. Some telegraphic messages were sent up to me, and I advised Colonel Pipon whenever he wished it. My intercourse was exclusively with him; I do not recollect deciding anything, as has been stated, against the prisoner. It is quite possible that to some question which was sent up to me by the court I may have given some answer against the prisoner; but, however that was I had no more to do with the Deputy Judge Advocate-General than if he had been any other person whatever. The question was sent to me and the Deputy Judge Advocate-General was acting down at Aldershot advising the prosecution, and if a question was sent up to me to advise upon it the circumstance of the Deputy Judge Advocate-General filling that post would not have entered into the subject in the slightest possible degree. With respect to the mere technical objection, that he was connected with the office, I do not think that was one upon which I could have refused to allow him to assist the prosecution. It must be recollected that, whatever may now be the status of the office, it was the duty of the Deputy Judge Advocate's office to conduct the prosecution. One of my predecessors, upon the trial of General Whitlock, in the commencement of this century, performed the duties of absolute prosecutor. I do not say that it was a right course, but there was no technical objection to it. I could not, therefore, say that the Judge Advocate-General's office was so completely distinct as to render it wrong upon those grounds. I looked to substance and not to form; and, as I said before, it was not exactly the course which I should have advised or wished; in short I advised as strongly as possible against it, but it occurred in that shape, and the prisoner being advised by a person like Mr. Harcourt, and General Horsford being advised by a person like the then Deputy Judge Advocate-General, there was no substantial objection; and the part of the Judge Advocate, so far as there was any part, was conducted by Colonel Pipon, communicating directly with me on the subject. Although, as I said before, it is not a course which is likely to be taken again, and it would not have occurred then but for the very special circumstances which I have mentioned, yet at the same time there was no substantial interference with justice, and I can only say again, in conclusion, as I said in the beginning, that there were special circumstances in that case which render it a matter of regret to me that I should have had to refer to it.

2836. (*Mr. Mowbray.*) You had to go back half a century to find a precedent, had you not?—I had not the least difficulty in finding a precedent.

2837. (*Chairman.*) I do not understand you to object in any way to to the new rule?—Not in the least.

2838. In point of fact you approve of it, do you not?—I approve of it.

2839. (*Mr. Mowbray.*) In fact, upon reflection, do you not think that it would have been better if an attorney had been employed to get up the case instead of the Deputy Judge Advocate-General being so employed?—No doubt.

2840. (*Lt.-Gen. Scarlett.*) Had the Horse Guards any legal adviser to go to except the Judge Advocate-General?—I put into those resolutions an express clause that when attorneys were employed for the prosecution it would be desirable that the Horse Guards should have the benefit of an attorney to assist them, but that was not the case at that time. Whether rightly or wrongly, the Horse Guards did apply to their ordinary legal advisers to assist them in marshalling that evidence, and that was the root of the evil; by that means the Deputy Judge Advocate-General became mixed up with the prosecution, and perhaps it would have been better that it should have been unknown that he had done so, and that he should have been recognized before the court as the person to assist in the prosecution; but it was a much fairer and a much more straightforward course than that, having taken some part in the prosecution, he should continue acting the Deputy Judge Advocate's office.

2841. (*Mr. Mowbray.*) Would not the next best thing have been that he should have retired altogether from taking any part in the case, and that other legal advisers should have been appointed?—Perhaps it might have been so; but I do not think it would have been so fair a course, because he would then undoubtedly have remained in my office, and then it would have come out afterwards that he had been taking part in the prosecution, and there would have been much more substance in the objection. If he had not been acting on the trial as he was I should have been in communication with him, and as it was I was not in communication with him.

2842. (*Lt.-Gen. Scarlett.*) Does not the whole of this rather tend to prove what was stated by a former witness, that it would be a very great advantage to the Horse Guards to have a separate legal adviser?—I think it is scarcely requisite, because a case of this kind occurs very rarely; but upon the occurrence of a case of this kind it would be much better that a counsel or an attorney should act.

2843. (*Lt.-Gen. Peel.*) I understood you to say that you considered that no practical injustice was committed on that court-martial by the Deputy Judge Advocate-General being there?—No.

Right Hom. T. E. Headlan.

7 May 1868.

2844. Was not a certain question complained of on the part of the prosecution as to which the prisoner wished to give evidence on another point, and it was objected to and afterwards, in the reply for the defence, was not that very thing brought forward?—There were objections to the reply, I think, which were perhaps proper objections; but I did not quite understand what was the particular point.

The witness withdrew.

W.G.G.V.V. Harcourt, Esq. Q.C.

William George Granville Venables Vernon Harcourt, Esq., Q.C., recalled and further examined.

2845. (*Chairman.*) Do you wish to make any further statement to the Commission?—There is one thing which I omitted in my evidence, which I wish to supply. According to my experience it is the practice upon military courts-martial to refuse to the prisoner a perusal of the depositions, or I should perhaps more correctly say preliminary examinations, with reference to the charge against him. In the only instance of which I have personal experience it came to my knowledge that a great number of witnesses had been examined for the prosecution; that their evidence had been taken down in the Judge Advocate-General's department; that evidence, as I believe, having been taken in India, I think before magistrates, on the subject of the charge against the prisoner. I advised the prisoner to make a written application, if I remember rightly, both to the Judge Advocate-General's department and to the Horse Guards, or certainly to one of them, to be allowed to see those depositions. We received a reply that that could not be permitted. I imagine, therefore, that there is some rule in that respect in the military service which is different from that in the civil tribunals. I lay no stress upon the fact of the thing being in the formal shape of a deposition, but I do think that it is fair to the prisoner that he should be allowed to know what are the names of the witnesses and the character of the evidence which has been preliminarily taken against him and upon which the charge is to be supported. To be without such information seems to me to place the military prisoner in a position of exceptional disadvantage.

2846. (*Mr. Mowbray.*) You have spoken of a practice. Do you know, or have you ever heard of any instance where such a practice has prevailed, except the single instance to which you allude?—I know of no other instance, my experience being confined solely to that particular case.

2847. Are you aware that in the recent Fenian trials the course which you suggest has been pursued, namely, that the names of the witnesses and the substance of the evidence which they are to give has been communicated to the persons charged with the offences before the trial?—That is not within my knowledge. If it is so, I can only say that I think it is a very proper practice.

The witness withdrew.

Capt. A. P. Miller.

Captain A. P. Miller called in and examined.

2848. (*Chairman.*) You are the governor of the military prison at Aldershot, are you not?—I am.

2849. How long have you been in that position?—I have been in the military prison service 17 years in August; I have been 12 years at Aldershot, and I formed the military prison there.

2850. Had you had any experience of military prisons before you went to Aldershot?—Yes; I had been superintendent of the military prisons and garrison cells in Canada for four years before that. Of course I was in the service before that; I was a captain in the 92nd Highlanders before that.

2851. In the course of your experience at Aldershot you have had, I presume, to inflict all the military punishments that are usually inflicted under sentences of courts-martial?—Yes.

2852. Will you state to the Commission what are the military punishments which in the prison at Aldershot you have the means of inflicting?—We carry out what are called sentences of hard labour only; we do not carry out solitary sentences, because we have no cells. No solitary sentences have ever been carried out at Aldershot from want of means.

2853. Have you ever been in a prison where they had the power of carrying out solitary confinement?—I was superintendent of one in Canada where we carried it out. There were 60 or 70 prisoners.

2854. Have you in your experience been cognizant of all the classes of punishment which can be inflicted by military tribunals?—Yes.

2855. Of every kind?—Yes, both by courts-martial and commanding officers' sentences also.

2856. Will you state what you consider to be the severest punishment which can be inflicted by military tribunals?—Hard labour.

2857. For what period can that be inflicted?—At present they can go up to any period they like up to two years, in fact I have some men with four years, double sentences.

2858. What is the nature of the hard labour in the prison at Aldershot?—The nature of hard labour in the prison at Aldershot consists of shot drill for the third and second classes, and picking oakum.

2859. I presume that the shot drill is the severest, is it not?—It is so to some people, but it depends upon the constitution entirely.

2860. Can you point out any punishment which is severer to any constitution than shot drill?—I am not prepared to do that.

2861. Have you any means of inflicting the punishment of the treadwheel?—No.

2862. What are the means of inflicting hard labour that you have?—I can give shot drill. I have the means of inflicting hard labour upon men who have been some time in prison by special authority of the Secretary of War by employing them upon the public works, and when that is properly directed and managed I consider that I could even get more hard labour out of them by that than by any other means.

2863. (*Lt.-Gen. Peel.*) If a man is sentenced by a court-martial to hard labour, does the nature of the hard labour to be inflicted upon the prisoner rest exclusively with you?—No, I have no option. I must carry out the hard labour.

2864. When you receive a prisoner under sentence of court-martial, what is the nature of the committal?—That he is to have so many days imprisonment with hard labour, subject of course to the opinion of the medical officer that he is fit for it.

2865. Having received that prisoner with such instructions, does it remain with you to inflict whatever hard labour you consider proper?—I must inflict the regular hard labour, which is shot drill, within the prison, unless the medical officer certifies that the man is not fit for it.

2866. (*Capt. Vivian.*) For how many hours in the day?—For three hours.

2867. (*Lt.-Gen. Scarlett.*) Could you inflict shot drill during the whole time that he is in prison?—For a very short sentence, but you could not do it for any length of time in my opinion with safety.

2868. (*Chairman.*) Have you means of inflicting any hard labour which is productive?—I have.

2869. What is the nature of that hard labour?—I have special authority from the Secretary of War that when the men are in the first class they may be employed in the Royal Engineers' department on the public works; that is to say, in digging gravel, making roads and drains, and any kinds of work that is of advantage to the public.

2870. (*Capt. Vivian.*) Will you be good enough to explain what the meaning of "classes" is?—When

Capt. A. P. Miller.

7 May 1868.

a man first comes into prison, as a general rule, he goes, no matter what he is, into the third class, and he goes through a probation there; and if he has not been convicted before he very soon gets out of that class.

2871. What do the third class do?—They pick oakum and they carry shot.

2872. Then what is the difference between the third and the second classes?—The second class carry a lighter shot and pick oakum, and that is the only difference. In the first class, if I can find useful work for them, they never go near shot drill.

2873. (*Lt.-Gen. Peel.*) But the classification is a prison classification and not as to their character as soldiers?—No.

2874. (*Capt. Vivian.*) It is simply as regards their conduct in prison?—Yes.

2875. (*Chairman.*) Then whatever the crime may have been for which a prisoner is sentenced, when he comes into your hands it is left entirely to your discretion, and you have no power of referring to the nature of the crime for which he is sentenced?—The answer to that would be that if a man has never been tried before, supposing he came to me, and I thought it advisable, if he was a man of good character, I have the power of putting him into the first class within a very few days, but if he has been tried before there is a regular time which he must serve in each class.

2876. (*Lt.-Gen. Peel.*) But how do you ascertain whether or not a man has been tried before?—Because in the commitments we must be furnished with the previous convictions and the history of the man. With each man we get a regular committal paper, with all his previous history marked upon it, even to his regimental punishments by the commanding officer.

2877. (*Chairman.*) Do you keep a register of all the prisoners who come under your supervision?—Yes.

2878. Have you been able to observe the effects of the different punishments upon the individuals?—Yes.

2879. Taking shot drill as the severest punishment, do you observe any great difference in the repetition of crime as between prisoners who have been subjected to shot-drill and those who have had other punishments inflicted upon them?—Not the slightest.

2880. You think that as many prisoners come back for a second punishment who have had shot drill inflicted upon them as of those who have had other punishments inflicted upon them?—My own opinion is, that probably fewer come back under the other system.

2881. (*Lt.-Gen. Scarlett.*) But they all have to undergo shot drill, have they not?—Yes, at first starting.

2882. (*Chairman.*) In your opinion what is the punishment which the soldier dreads the most?—My own opinion is that the punishment which a soldier dreads the most is bread and water.

2883. Do you inflict that punishment?—For prison offences I or the visitors can inflict it.

2884. Have you had any experience of corporal punishment?—I have seen it more or less, of course.

2885. Should you say that a soldier dreads any punishment which is now inflicted as much as he dreaded corporal punishment while it was possible to inflict it?—So far as my opinion goes I feel quite certain that many soldiers would much sooner have a flogging than be imprisoned. I have known many men who, I am sure, would rather take a flogging than go on bread and water. I have practical experience of it; that is to say, if I can judge by what the men have told me themselves.

2886. Then is it your opinion that the abolition of corporal punishment has been advisable?—No; that is, with reference to the army outside, because corporal punishment is not abolished in the military prisons. The visitors can flog in the prison for a prison offence. One visitor can give 25 lashes, and three visitors can give 50 lashes.

2887. (*Lt.-Gen. Peel*) Do you mean since the alteration in the Mutiny Act?—The prison rules are not altered.

2888. (*Viscount Eversley.*) When the prisoners are not employed at shot drill or in hard labour, are they associated together or are they confined in separate cells?—In a regular prison when they are not at labour they are in cells; but in my prison, where we have no cells, they are always associated. Ours is an imperfect prison; it is a temporary prison.

2889. (*Chairman.*) You say that you have had experience of solitary confinement?—Yes.

2890. Do you think that the soldier dreads it?—It depends entirely upon the man himself. If he is a lazy man he likes it. I myself have a strong opinion against solitary confinement, because it encourages idleness. A man just sits down, and he is thinking probably not on the best of subjects, and doing no good all the time. I do not think that he cares about it if he is lazy; but if he is an active man he would rather be at work.

2891. (*Maj.-Gen. Horsford.*) Is it not in extreme cases that you have recommended that the visitors should adopt flogging?—Visitors as a general rule are always extremely against it; they only do it in extreme cases.

2892. Therefore, if they only do it in extreme cases, would it not be supposed that it was a greater punishment?—I do not know about that. Some visitors have taken my view, and have considered, as I strongly believe (and I cannot get it out of my head), that bread and water continued for a certain number of days is the most severe punishment to a man. A pound of bread in 24 hours continued for seven days, which a single visitor can give, is a fearful punishment.

2893. (*Chairman.*) With regard to that punishment, have you observed the effect which it has had upon the *physique* of the men?—It pulls them down terribly.

2894. Then the disadvantage of that punishment is that it makes a soldier less capable of performing his duty to his country, does it not?—Yes, of course, if he had been kept on bread and water, and he was to go out immediately after that he would not be so fit to do his duty as if he had been on regular diet.

2895. Could you suggest any mode by which a system of hard labour on a more extensive plan than now exists could be adopted in our military prisons? For instance, do you think that it would be possible to introduce the system of breaking stones; have you that punishment?—We have in most prisons.

2896. Might not the prisoners be engaged in any other works of public utility?—Yes, but of course it would require to be regularly organized. I may state that we have tried a system of hard labour at Aldershot with which some of the members of this Commission are acquainted. Some years ago, when I found I had a great many prisoners there, and really did not know what to do with them in a temporary prison, it was suggested to make them useful. There was a great deal of labour which was required to be done for the camp, and the Secretary of War gave us permission to employ our first-class men at it. I think that if that labour were properly carried out and managed, we could get and ought to get from every soldier under a court-martial sentence a certain amount of remunerative hard labour during his imprisonment.

2897. (*Lt.-Gen. Scarlett.*) Have any applications been made as to the employment of the third or second class prisoners?—Yes, there has lately been an application to extend the principle which has answered very well at Aldershot, but it has been refused. That has not come officially to me, but I know that it has been refused. There is a feeling against it.

2898. (*Viscount Eversley.*) Is your punishment of the third class much more severe than that of the second class or of the first class?—It is more severe in one way, that there is no good in it, and it is

disgusting men, if you can call it so; there is no mind required in it. We have had several kinds of works at which a man cannot be idle. Of course he may be on a work where he can be idle, but I believe that you would get more hard labour out of a man, if it is properly managed, at useful labour than by sending him to shot drill.

2899. Do you ever find it necessary, as a punishment for a prison offence, to degrade a man from the first class to the second class?—Yes, and to the third class.

2900. (*Chairman.*) Could you suggest any very severe punishment, of which you think a soldier would have a great dread, to take the place of corporal punishment, in cases, for instance, of insubordination?—You can only have imprisonment and hard labour, which involves forfeiture of pay. I cannot suggest anything else that the country would stand.

2901. Have you any means in any of the military prisons of applying the treadwheel?—It could be done, of course.

2902. Could it be done at Aldershot?—Of course if there was a treadwheel put down there it could be worked.

2903. (*Capt. Vivian.*) Have you any dark cells in the military prison at Aldershot?—We have two cells which we call dark cells, but they are not dark cells.

2904. (*Chairman.*) From your experience of military prisons, do you think that in all of them there are sufficient means of inflicting military punishments?—Yes, there are perfect means of doing so in all, except probably in my own.

2905. Have you had any experience of solitary confinement in civil prisons?—Not from having been in charge of them, but I know a good deal about them. I happened to have a military prison once which was inside a convict prison, so of course I came into contact with it.

2906. Should you say that the punishments inflicted in military prisons are more or less severe than those inflicted in civil prisons?—I cannot give an opinion upon that.

2907. (*Mr. Whitbread.*) You say that you have no cells at Aldershot?—Strictly speaking we have 12 cells, and that is for 400 men.

2908. Do you keep your men in what is technically termed "association"?—Yes.

2909. They may speak to one another?—Yes.

2910. Is not that regarded as the very greatest luxury in a prison?—A prisoner is not supposed to speak.

2911. But he does speak, does he not?—He does; it is human nature to do so.

2912. Do you mean by solitary confinement what is technically termed solitary confinement, or what is termed separate confinement; you are aware of the distinction?—Yes, I am aware that there is an important distinction between separate confinement and solitary confinement. Separate confinement means that the prisoners work together, for instance, at shot drill or at any occupation, such as picking oakum. Separate confinement means separate cells for their food and for sleeping in.

2913. Is not the system of punishment in separate cells as conducted in all the new prisons in England under the new Act this, that there shall be as little communication as possible between the prisoners, that not a word more than is absolutely required for the duties of the prison shall be spoken, and that although they are sometimes brought together for shot drill, at all other times they are confined in the cells without communication with each other?—Yes.

2914. The distinction between that and solitary confinement was, that under solitary confinement under the old law they were to see nobody except the governor once a day?—Yes; also the medical officer, chaplain, and other authorized prison official.

2915. How many prisoners have you now in the prison at Aldershot?—Between 300 and 400.

2916. Of those, how many would be in the first class, and how many would be in the second class?—As a general rule, about 130 might be in the first class, perhaps about 50 in the second class, and the remainder in the third class.

2917. Are all those men sentenced to hard labour?—All that come to the prison.

2918. Out of the 300 or 400 prisoners, how many would be employed in what are called prison duties?—That is hardly a fair question to ask as to Aldershot, because it is such a temporary sort of place; for instance, we have to employ six or seven prisoners where in a regular prison one or two men would be enough.

2919. It is regarded also as a great boon by prisoners to be employed in the kitchen, or bakehouse, or washhouse, is it not?—Yes.

2920. It lightens the sentence?—Yes. These employments are occasionally given to men for short periods who have long sentences, and who have been for a considerable time in prsion, to give them an case off.

2921. What is the weight of the shot which you use?—32 pound shot and 24 pound shot.

2922. Has the 32 pound shot been objected to on medical grounds as being too heavy?—If the medical officer objects to it he sends them to the 24 pound shot.

2923. What is the nature of the oakum picking, are the junks given to them unravelled?—Yes.

2924. Then it is not hard labour, is it?—It is hard labour in one sense. I consider hard labour to be any continuous "labour" which a man is obliged to perform whether he likes it or not.

2925. Are you aware that giving a man junks to unravel himself, the junks being two feet long or so, makes oakum picking exceedingly hard muscular labour?—It comes to the same thing, supposing we give him easy oakum to pick, because then he must pick so much more.

2926. Is the out-door hard labour which you give in the camp?—Yes, and in the neighbourhood of the camp.

2927. Is that in sight of the soldiers in the camp?—Some of it is.

2928. Has there ever been any objection raised to that, on the ground of communications or signs, more or less, passing between the prisoners and the bystanders?—No, I cannot say that there has.

2929. You are aware, no doubt, from your prison experience, that the convicts were withdrawn from the dockyards mainly on the ground of communications and traffic passing between them and the civilians outside?—I am aware of that. I think that even in a prison itself, like Aldershot, if they are determined to have communication they can have it, whether they are inside or outside, unfortunately.

2930. Can a prisoner have communtcation in a well-built prison?—Not in a well-built prison.

2931. You are not satisfied with the prison at Aldershot as a prison?—It is not a prison.

2932. And you cannot carry out a severe system in such a prison as that?—No.

2933. Will you put in a scale of your dietary?—I have not one with me, but I can send one.

2934. Is that scale universal throughout the military prisons?—Yes; the prison scale at home is universal.

2935. (*Chairman.*) Will you state the quantity of bread and water which a man gets as a punishment?—When a man is on bread and water he gets a pound of bread in the daytime in 24 hours.

2936. Is that administered at once?—That is just optional, according to the prison convenience.

2937. (*Lt.-Gen. Eyre.*) Are you able to suggest any summary punishment which would be capable of being applied very promptly to bad cases?—If it is a bad case the best thing is to have the man handcuffed at once and put into a refractory cell and kept on bread and water, and I think that in a very few days that will tame most men.

Capt. A. P. Miller.
7 May 1868.

2938. (*Mr. Whitbread.*) Did you ever know a man stand three days of real dark cells without being tamed?—I have an experience of one cell, 24 hours in which I think would tame most men, and that is not very far from here.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Room E., House of Lords.

Thursday, 14th May 1868.

PRESENT:

SAMUEL WHITBREAD, Esq., in the Chair.

Marquis of Hartington.
Viscount Eversley.
The Right Hon. J. R. Mowbray.
The Right Hon. Thomas E. Headlam.
The Right Hon. Russell Gurney.
Lieut.-General Sir J. Yorke Scarlett, K.C.B.
Lieut.-General Henry Eyre.
Colonel Lowder, C.B.
Captain the Hon. J. C. W. Vivian.
John Lloyd Wharton, Esq., *Secretary.*

Col. E. Henderson.
14 May 1868.

Colonel Edmund Henderson called in and examined.

2939. (*Chairman.*) What office do you hold connected with civil prisons in England?—I am the chairman of the board of directors of convict prisons.

2940. And with regard to military prisons what office do you hold?—I hold the office of inspector-general of military prisons.

2941. What was the date of your appointment to the board of directors of convict prisons?—1863.

2942. And before that I think you were connected with prisons in Australia?—I was comptroller-general of the convict department in Western Australia.

2943. Does that appointment of inspector-general of military prisons give you any real control over the military prisons?—It is simply an advising appointment; I have no executive power. I merely advise the Secretary of State upon such matters as he submits to me.

2944. And you have no real control over the management or conduct of the military prisons?—Only so far as the Secretary of State asks for my advice.

2945. You have inspected all the military prisons since your appointment, I have no doubt. Do you think that the military prisons are fit places in point of construction for the infliction of severe sentences of imprisonment?—The military prisons vary much in point of construction. The principal ones at Aldershot, at Fort Clarence, and smaller one at Shorncliffe are wholly deficient in what ought to constitute a good prison. The prison at Aldershot is simply a collection of huts in which the men live in association and are worked in association. There are no cells whatever, except three, which you can scarcely call cells; they are fitted up in one of the huts. The prison at Fort Clarence, which is, in fact, where the old casemates are, is quite unfit for use as a prison; and the prison at Shorncliffe is very much the same as that at Aldershot. The other prisons, so far as they go with regard to the amount of cell accommodation, are very fair.

2946. You have mentioned the prisons at Aldershot, Shorncliffe, and Fort Clarence; what are the other prisons?—There is Gosport, which I think is probably the best.

2947. Was that built for a prison?—That was built for a prison on the cellular system. Then there are Devonport, which is a small prison, but that is entirely similar; and Weedon, which is a very fair prison; and the new prison at Southwark.

2948. (*Lt.-Gen. Scarlett.*) That was formerly the Queen's Bench prison, was it not?—It was formerly the Queen's Bench prison. It was proposed to build a cellular prison at Aldershot, and there has been a sum of 5,000*l.*, I think, taken upon the estimates for this year for that purpose. I think that as far as the appliances and means of the military prisons go, the discipline is in a sound and wholesome state; but of course punishment in association is not punishment in the true sense of the word.

2949. (*Chairman.*) You consider that it is an essential point to have a prison arranged upon the cellular system?—Clearly. That, in my opinion, is the whole essence of punishment. It is that which the men dislike the most.

2950. And without that it is impossible to inflict a sentence for which the men really care?—I think so decidedly, and I think that that is the opinion of every one who has seen those associated prisons.

2951. Besides the want of cellular arrangement, is it not the case that from the great subdivision of the military prison accommodation it happens that there are a great many prisoners always employed in light labour about the prison; for instance, in the kitchen and in the bakehouse, and generally in light tasks which are no real punishment?—Yes, that is unavoidably the case. Of course the prisoners have to do all the work in the prison, and of course the smaller the prisons the more are the men so employed, and that cannot be called severe punishment.

2952. I see that the military prisons are most of them (five out of six I think) in the south of England. Would it in your opinion be a good plan to concentrate the whole of the prisoners in one well arranged prison built for the purpose, and where you could carry out a strict system?—There is no question that it would be a very great advantage. The discipline of the military prisons at present depends very much upon the governor. The visitors are always a fluctuating body, and they may or may not take an interest in the prison work; and of course in a single prison you can carry out a definite form of punishment very much better than you can in a number of isolated prisons.

2953. In fact the real government of the prison rests with a fluctuating body at present, does it not?—At present it does to a great extent.

2954. And I presume that the punishment, as regards the severity of the sentence, varies very much in the different military prisons?—Very much at present from the association which they are in in the majority of them.

2955. Can you form any idea of the expense of constructing a prison on the cellular plan?—It varies very much, but I should think at a guess you could do it from 100*l.* to 120*l.* a cell.

2956. Would it amount to so much as that if you used convict labour in the construction of it?—No, it would be very much less in that case.

2957. Could you do it for half that sum, do you think?—Yes, I should think you could do it for 60*l.* or 70*l.*, certainly.

2958. You have had some experience in constructing a prison by convict labour, I believe, recently?—

Yes, I am building one now for 700 prisoners, which will be built for about 42,000*l.*

2959. (*Lt.-Gen. Scarlett.*) Is that to be a military convict prison?—No, it is to be a female convict prison.

2960. (*Chairman.*) Do you agree in the policy of inflicting sentences of penal servitude upon soldiers for purely military crimes?—No; I have always thought it decidedly a mistake. I do not think that any court-martial ought to have the power to sentence a man to penal servitude. I think that it would have a much better effect if they sentenced them to long terms of imprisonment, and if those sentences were carried out in the same prison in which the shorter sentences are inflicted. At present when a man is sentenced to penal servitude he goes away to a convict prison, and he is lost sight of, and the effect upon his comrades is entirely lost, and for himself, from the very fact of his going to a convict prison he is more or less demoralized for the service. I think that very few commanding officers wish to have such men back, although in that respect I believe among the soldiers there has been a considerable change of late, and they are very much more anxious to rejoin their corps than they used to be.

2961. (*Lt.-Gen. Scarlett.*) Would you have every man discharged who is sentenced to a long term of imprisonment?—No, I would not; and I do not think that it would be necessary if you had them in a strictly military prison.

2962. Then would there not be an objection that as the man was still on the strength of the regiment, his comrades would be doing his work during this long imprisonment; as he would still remain a member of the regiment, unless his place was filled up by a recruit, the good men would have to do his duty while he was in prison?—I presume that that is unavoidable so far; but I think it is a mistake to hold out to a man that he is, as you may say, entitled to be discharged when his imprisonment is over.

2963. (*Chairman.*) What is the duration of the greater number of sentences which come into military prisons?—The average duration is short. I do not know of the exact figures, but I should think 100 days would be the average. Long sentences are exceptional.

2964. Would three months' sentences be about the average?—Three months would be about the average I should think; but I could not speak certainly upon that point.

2965. Do you think that it would be advisable to make any change in the diet with a view of making those short sentences more severe?—The dietary at present in military prisons appears to give satisfaction, but I certainly think that for short sentences it might be quite possible to make it more penal in its nature than it is.

2966. Is it higher than the dietary for short sentences in civil prisons?—I should think that it was. I am speaking of the county prisons and not of the convict prisons.

2967. Do you believe that the visitors of a military prison have still the power of inflicting corporal punishment for a prison offence?—Certainly. So far as I understand, the resolution which was passed in the House of Commons merely affects the power of courts-martial to inflict corporal punishment.

2968. Do you hold it to be absolutely necessary that that power should be retained?—I think that it is certainly decidedly necessary in a prison, although it is a punishment which now is only resorted to in the convict prisons in the case of brutal and premeditated assaults and in the case of mutiny accompanied by violence. Where you have to maintain very severe and strict discipline I think it is necessary to retain that power.

2969. (*Lt.-Gen. Scarlett.*) Could you suggest any punishment in the place of it if it were done away with, which would be equally efficacious, or nearly as efficacious?—I think that separate confinement as it is now carried out in convict prisons in a great many instances (I will not say in all) is a more deterrent punishment to many men than actual flogging.

2970. (*Chairman.*) That is to say it is more deterrent than actual flogging if it had been administered outside the prison?—Precisely.

2971. (*Lt.-Gen. Scarlett.*) Do you think that upon the remainder of the men a punishment of that sort has much effect; do you think that imprisonment is deterrent to a man's comrades?—I think that imprisonment is, if it is rigidly carried out.

2972. How do the men of the regiment know that it is so carried out, unless they have suffered it themselves?—That would be the advantage of a central prison, where the fact would become generally known.

2973. (*Chairman.*) The objection has been raised against a military prison, that it would involve the conveyance of soldiers backwards and forwards, and people have an idea that it is not a good thing to let the public see soldiers being conveyed to prison; is there any reason why that should continue to be the case?—None at all that I see. A man when he was sentenced to imprisonment should be put into a prison dress at once, and should be taken away to prison by a warder sent from the prison for the purpose. It would involve no more expense and would avoid all exposure to the public.

2974. In fact now the expense is greater under the present system, because I think they send more than one man to take a prisoner to one of the military prisons, do they not?—It takes three, a corporal and two men.

2975. How many men do you take to send a prisoner to one of the convict prisons?—One is quite sufficient. If there is any fear the prisoner would simply be handcuffed to the warder.

2976. I think you do not send more than one warder with two prisoners, do you?—We generally move the prisoners in large batches; we very seldom move them singly; but one man would be ample to take care of two men handcuffed together.

2977. What proportion do the warders bear to the prisoners in moving the prisoners from one prison to another?—Under a dozen you would send two warders, and above that three, and so on; one additional warder to every ten men.

2978. (*Capt. Vivian.*) Are they armed?—They have simply side arms.

2979. (*Lt.-Gen. Scarlett.*) Do you send them by the common trains or by prison carriages?—By the common trains, and we never, that I am aware, lost any prisoner in the transit.

2980. (*Chairman.*) In the convict prisons on public works what number of warders are required to take charge of a working party of prisoners?—The general allowance of warders to prisoners is about ten per cent.

2981. In the military prison at Aldershot do you know what proportion of guards there are to the prisoners?—I do not think I can give you that information, but I can obtain it.

2982. Have there been several instances of escape from the prison at Aldershot?—There have been a few.

2983. (*Lt.-Gen. Scarlett.*) From the prison?—From the works.

2984. Not from the prison itself?—No.

2985. But from gangs of prisoners out at work?—Yes. I do not recollect a case of escape from the prison itself.

2986. (*Chairman.*) Have there been more than there should be in a well conducted prison on a larger scale?—I hardly know that. It is difficult to answer that question.

2987. Under what circumstance is remission of sentence granted to military prisoners?—At present the remissions that are granted are, so to speak, entirely arbitrary; and my own opinion is that no remission should be granted except on a fixed scale, and that the men should earn that remission. I think it would be a great point to hold out to the men that it is a great thing to earn their discharge from prison.

Col. E. Henderson.

14 May 1868

2988. You think that remission should depend upon conduct in prison?—Upon work; and that they should forfeit any remission they gain by work for misconduct. That of course would not interfere with the power of the Commander-in-Chief to remit the sentence of any man if he saw fit on grounds connected with his conviction; but I refer simply to conduct in prison.

2989. (*Lt.-Gen. Scarlett.*) Are not the men classed in prisons?—Yes.

2990. Are not the men of the first class allowed greater latitude than those of the second and the third classes?—They are.

2991. (*Chairman.*) Does a prisoner memorialize for a remission of the sentence, or how does he set about getting it in the military prisons?—In the convict prisons he petitions the Secretary of State, and I presume in a military prison he would address the commanding officer of the regiment.

2992. I presume that the cost of the staff in one central prison would be very much smaller than the cost of the united staffs of all the six military prisons at present?—Of course it would. The same number of men would be required.

2993. And you do not think the cost of conveying the prisoners to and fro would be a serious element in the calculation?—I certainly do not, considering that all the military prisons, certainly in the south of England, are within a very few hours of each other by rail.

2994. If you had a prison of that sort you would be obliged to have it attached to some large public works?—That would be a very great advantage, because you cannot carry out separate confinement beyond nine months, and after that you must work the men in association more or less.

2995. But even when they are worked in association you recommend that they should go back into the prison to their separate cells?—Certainly.

2996. So that they should not have any communication with each other?—Yes.

2997. And that in your opinion is the severe element in the punishment?—Certainly.

2998. (*Capt. Vivian.*) Do you confirm the evidence given the other day by a witness who said that the severest punishment he thought to which a soldier could be subjected was being put upon the bread and water system?—There is no question that the bread and water system is a very severe punishment, but it is one that you cannot carry to any very great extent.

2999. For what reason?—You break the man down if you give him too much bread and water. It merely answers as a prison punishment.

3000. But I suppose it is the severest prison punishment which you have at present in the military prisons, is it not?—It is, if it is coupled with separation.

3001. You have no dark cells at Aldershot, have you?—No. One hut has been divided into three parts, that is all the cells they have there.

3002. They are not dark cells?—They are not dark cells, they can talk through the boards.

3003. (*Chairman.*) The punishment of dark cells is, next to corporal punishment, the severest form of prison punishment, is it not?—It is, and in most cases it is more severe than actual flogging.

3004. To what extent are you empowered by law to award dark cells?—I think it is three days at a time.

3005. That is a punishment of which even the most voilent men have a very great dread, is it not?—No doubt.

3006. When once they have undergone 24 hours dark cell, they have a very great dread of returning to it again, have they not?—Yes.

3007. Do you think that the imprisonment, as it is now carried out in military prisons, has much effect in checking drunkenness?—I have not the statistics of drunkenness in the army, but there is no question that the number of commitments for drunkenness has enormously increased. It has increased from 703 in 1847 to 1,926 in 1867.

3008. (*Lt.-Gen. Scarlett.*) Is not that more from its being brought into notice from the trial for the fourth time of drunkenness being insisted upon?—That of course swells the number in the military prison.

3009. Then you do not argue altogether that drunkenness has increased in the army?—No. I have not the whole statistics of the army, that of course we do not get; but I think the general opinion is that imprisonment after a certain time ceases to have much effect in checking drunkenness; I believe the great check to drunkenness is to take away from the soldier the means of getting drunk, that is to say, by mulcting him of his pay and confining him to barracks.

3010. (*Chairman.*) Are you also the inspector of the military prison at Lewes?—No; that is entirely under the Admiralty.

3011. You have no control of that prison?—No.

3012. Can you give the Commission any notion of the value of the labour which you can get out of the prisoners on public works?—On some descriptions of work you can get very good value for your labour. I think at Chatham last year the expenses of the prison were 34,000*l.*, and the actual earnings of the convicts were over 40,000*l.*, including that in the interior of the prison.

3013. Do you mean that the prison at Chatham paid for itself last year with a balance over?—It more than paid for itself. The men are there employed on very remunerative work, that is upon making bricks for the Admiralty, and they are valued simply at the cost price that the Admiralty would have to pay for them to an ordinary contractor, so that it is actual value.

3014. Would it be possible in your opinion to get any return from soldiers confined for military offences?—You might get a certain return, but the majority of the imprisonments are short, and of course labour in the cells is not very remunerative, though in some cases it is so. In the civil prison at Wakefield they make mats, and I believe they get a very fair return for their labour; but the majority of the work in cells is not, so to speak, remunerative.

3015. Do you think that it is an advantageous part of the prison discipline to have remunerative labour for the prisoners?—I think it is to a certain extent a secondary consideration, especially with short sentences. The great point there is to make the punishment deterrent. The remunerative part of it is in my opinion a secondary consideration; it should, of course, not be lost sight of, but I do not think it should interfere with the nature of the punishment that you inflict.

3016. Do you observe in your prison returns the immense quantity of re-convictions for the second, third, and fourth times to the military prisons?—The returns show a very large proportion of re-committals, and that I think bears out the opinion that is very widely expressed that after a certain time those short sentences lose their effect, as at present administered at any rate.

3017. (*Lt.-Gen. Scarlett.*) Do you allude to military prisons?—To military prisons. The proportion of re-committals is very large, especially as compared with these to the convict prisons.

3018. (*Chairman.*) Yo have had considerable experience in the army, did you ever form any opinion as to whether it would be desirable to give more power to the commanding officers, so as to avoid such a number of regimental courts-martial?—Yes, I have a very strong opinion upon that subject; I think that a soldier should be led to think that a court-martial is a very serious thing, and I think myself that any commanding officer who is fit to be intrusted with a regiment is fit to be intrusted with the same powers as are now given to a regimental court-martial, and I would have no punishment short of at least 42 days inflicted by court-martial, and for that I would have a district court-martial.

3019. (*Capt. Vivian.*) So that you would do away with regimental courts-martial altogether?—I would do away with regimental courts-martial altogether.

3020. And increase the power of the commanding officer?—Yes, I would increase the power of the commanding officer.

3021. (*Lt.-Gen. Scarlett.*) Do you known what powers are intrusted to the French commanding officers?—I do not.

3022. (*Chairman.*) What is the average number of prisoners in confinement in the military prisons in England?—The average number, I think, you may take to be from 900 to 1,000. I am speaking there of the military prisons merely in England, without reference to Ireland.

3023. Of those which you would consider it advisable to concentrate?—Yes.

3024. Can you give me also the number of prisoners in the convict prisons in England for military offences sentenced by courts-martial?—About 100 at present, I should think.

3025. Your object would be to confine them all in one prison, so that when a man came in for a short sentence he should see those who had already been there a long time undergoing a very severe discipline?—There can be no question that it would have a very deterrent effect in my opinion.

3026. Instead of losing sight of them altogether when they go to the convict prisons?—Quite so.

3027. (*Lt.-Gen. Eyre.*) If I understand the present state of prison statistics they show rather a tendency to an increase in the number of military prisoners; is that so?—I think it is.

3028. What do you think that indicates as regards the discipline and the effect of the punishment?—The number of the prisoners is very much swelled by the system at present in force, under which men who are drunk more than four times in the year are tried by court-martial. That has increased the number very much. I do not think that other crimes have increased very much, speaking from memory.

3029. On that particular subject have you been able to form an opinion as to the soundness of that plan?—I think that after a time imprisonment ceases to have much effect in preventing a man from getting drunk.

3030. But to the practice which is now imperative, of trying a man every fourth time, have you any opportunity of judging whether that is desirable?—In my own opinion it is not a good plan. I think it would have a far better effect, as I said before, to deprive the man of the means of getting drunk.

3031. Do I rightly understand that you think that crimes which are purely military should not be treated in the same way as those which are included in the ordinary code of morals, and that the punishment should be different?—Certainly. I do not think that a military offence ought to be made a felony; it is not a felony.

3032. What, in your opinion, is the most effective punishment in a case requiring immediate and severe treatment; in such a case, for instance, as an act of gross insubordination, stricking an officer, keeping in view the example to others as well as the punishment to the man?—In the absence of course of corporal punishment, short of cruelty, you have no alternative but to lock a man up in a cell, and there to keep him till you can try him.

3033. (*Chairman.*) Would you think that a sentence of a day's dark cell or two days' dark cell would be a deterrent punishment at the commencement of a man's imprisonment?—I should prefer keeping sentences to dark cells for punishment in the prison as a prison punishment.

3034. (*Capt. Vivian.*) What objection do you see to its being included in the sentence?—Simply that it deprives you of all your power of dealing with the man after he gets into prison.

3035. But why should it follow that because a man is sentenced as part of his punishment to suffer, say three days' dark cells to commence with, afterwards, in the course of his punishment, he does not conform to the prison discipline, you should not then as governor of the prison again sentence him to it?—I do not see any very strong objection to it.

3036. (*Chairman.*) Practically you do not inflict the sentence of dark cells imprisonment for three days, but you merely keep a man there till he breaks down in his insubordination?—Yes.

3037. And you let him come out as soon as he is willing to behave himself again?—Quite so. You keep that in fact as your *dernier ressort.*

3038. What are the punishments inflicted in military prisons? Shot drill is one, is it not?—Shot drill is the principal punishment, and oakum picking.

3039. Is the oakum given them in the junk?—In the junk.

3040. Do they have to separate it themselves?—They have to separate the strands themselves and then to pick it.

3041. That makes oakum picking really hard labour, does it not?—I think oakum picking may fairly be called hard labour when given in that form.

3042. But the separation of the strands requires some amount of force, does it not?—It requires a considerable amount of exertion.

3043. They have no crank, have they?—There are no cranks in the military prisons now.

3044. And no treadmills?—No treadmills.

3045. And no other form of severe labour, except short drill?—Short drill is the principal.

3046. Do you think it is a good plan having recourse to shot drill only?—No, I cannot say I have a very high opinion of shot drill as a means of punishment.

3047. (*Lt.-Gen. Scarlett.*) What would you propose in the place of it, or as an additional punishment?—It is my opinion that all short sentences should be spent in separate confinement with the cell crank, or in such other occupations as you could get for them in the cell; and no sentence under nine months should, in my opinion, be spent in associated labour; after that you must of course put them in association.

3048. (*Chairman.*) In point of fact shot drill is associated labour, is it not?—Yes.

3049. They keep silence, but it is a relief from the cell life?—It is a relief from the cell life.

3050. (*Capt. Vivian.*) But silence is theoretically kept, is it not?—It is theoretically kept to a considerable extent, but still there must be some communication. A man goes to that directly he goes into prison, and he sees all his comrades around him, and it detracts very much indeed from the value of the punishment.

3051. (*Chairman.*) Do you think it a good plan to employ soldiers in work in the camp in the sight of the other troops?—I cannot say that I do. They have been so employed at Aldershot, and have done very good useful work there; and considering the nature of the prison at Aldershot, I do not think that they can be better employed; but I doubt very much whether as a mode of punishment it is a good one to employ them about the camp in the midst of all their comrades.

3052. Is it not the fact that the convicts were removed from the dockyards mainly on the ground that communications and traffic passed between them and the civilians?—That was one of the very strong objections to their being employed in dockyards.

3053. And that lessened the punishment, did it not?—There is no question that it did so. The prisoners at Aldershot must be in constant communication with their comrades; they get tobacco planted for them, and so on.

3054. (*Lt-Gen. Scarlett.*) They do not mix much with them?—They do not.

3055. (*Chairman.*) You would like to have them more employed in some public work quite out of sight of their companions?—Isolation is the great thing.

The witness withdrew.

Capt. F. Powell.

14 May 1868.

CAPTAIN FOLLIOTT POWELL called in and examined.

3056. (*Chairman.*) You are governor of the convict prison at Chatham, are you not?—Yes.

3057. How long have you been connected with the convict service?—Nearly 12 years.

3058. Have you been during the whole of that time at Chatham?—No; I was three years and a half at Portland as deputy governor and since then I have been at Chatham.

3059. I think that at Chatham you have convicts who are sentenced by courts-martial in your charge?—We have.

3060. All military prisoners who are sentenced to penal servitude are sent to Chatham after they have undergone a period of separate confinement, are they not?—Yes.

3061. Where do they undergo that?—Either at Millbank or Pentonville.

3062. I think they have nine months of that?—Yes, nine months.

3063. And then they are sent to Chatham?—Yes, I think that some few Roman Catholic convicts were at one time sent to Portsmouth.

3064. Do you put them into a separate division?—They are worked in separate parties, and all put in one division together.

3065. (*Capt. Vivian.*) How many prisoners have you generally at Chatham on an average?—At present the total number is about 1,350.

3066. (*Lt.-Gen. Scarlett.*) What would be the proportion of military prisoners?—About 100, but I speak under correction.

3067. (*Chairman.*) Do you find the military prisoners as useful on public works as the others?—Quite so.

3068. Do you concur with the last witness in thinking that separation on the cellular system is an absolute requirement of a strict prison discipline?—I do.

3069. There is nothing that the men value so much as association, is there?—Nothing. You cannot carry out total separation beyond nine months for sanitary reasons.

3070. But even on public works the moment the men have finished their work they go back to the prison and each is sent to his cell?—That is so, and they also have their food in separation.

3071. That is to say that they take all the food which they take in the prisons separately, but I think you give some food on the public works?—No, none whatever. They are marched back to prison for their dinners in the middle of the day. They breakfast before they go out to work at a quarter before six in the morning.

3072. You have no cell cranks at Chatham, have you?—None.

3073. At Pentonville have they any?—I am not perfectly certain, to the best of my belief they have not; but I speak under correction.

3074. In what way are they employed then at Pentonville?—In mat making, shoemaking, tailoring, and employments of that character.

3075. Each man in his own cell and out of the view of the others?—Yes.

3076. Are they very glad to exchange the public works for that kind of imprisonment?—I think that the military prisoners as a rule are. I will not say that all the ordinary prisoners are, for some of them are men who have never done a hard day's work in their lives, and they hate it. The military prisoners are a more active body of men, and I have no doubt they generally are glad to get to the public works.

3077. Do you know any reason against the use of the crank in the cell?—I have never had any experience of it, so that I do not feel capable of giving an opinion on the subject.

3078. Colonel Henderson has told us that the prison at Chatham has more than paid its cost; does that include the cost of the staff as well as the maintenance of the prisoners?—It includes every possible expense. In Colonel Henderson's statistics, he included the labour in the interior of the prison, such as baking and cooking, washing, &c.; but Chatham prison for the last two years has paid all its expenses, by the value of the labour of the convicts on the public works alone, exclusive of those employed in the prison.

3079. They are chiefly employed, I believe, in brickmaking at Chatham?—A certain number are during the summer season, but the rest are principally employed in navvy work, forming new docks and building walls on the river, excavating earth, unloading barges of clay and sand for brickmaking, &c.

3080. (*Lt.-Gen. Scarlett.*) That is really hard work, is it not?—Yes, the men are earning at it an average of nearly half-a-crown a day, one man with another, by measured labour.

3081. (*Chairman.*) Are the Admiralty satisfied with your estimate?—I have never heard it disputed.

3082. Do they have an officer who measures it?—A schedule of prices have been agreed upon between the Admiralty Department, the War Department, and the Convict Department, and all our work is measured and priced according to that schedule.

3083. With regard to the bricks which they make, have they given satisfaction?—I believe they have given every satisfaction.

3084. They are used in the works?—Yes.

3085. (*Lt.-Gen. Scarlett.*) Do the prisoners themselves receive any remuneration?—A well conducted prisoner can earn as much as 3*l.* to be given on his liberation by instalments, and if he is an extraordinarily well conducted man he can be specially recommended for an additional 3*l.* That only applies to ordinary convicts. The military prisoners would earn about 3*l.* possibly, and it would go to their commanding officer for their necessary expenses.

3086. That is if they return to their regiments?—Yes.

3087. (*Capt. Vivian.*) How long do they take to earn 3*l.*?—They can just earn it in a five years' sentence.

3088. (*Chairman.*) But I believe now that they cannot earn any more if they have a ten years' sentence?—No.

3089. They cannot get more then under any circumstances?—No.

3090. Are you acquainted with the military prisons?—No, I have had no experience of them.

3091. But I think you could give an opinion as to whether it is possible to carry out a really severe system of prison discipline when you only have a very small number; do you think that it is possible?—I do.

3092. Is it not the case that so many men are necessarily employed about the cleaning of the prison and light labour of that sort, that you cannot really inflict a severe sentence in a prison which only contains a very small number?—There would be a difficulty if there were no long-sentence men included in that number to employ upon the lighter description of work. Our rule is that a man must be well conducted for a certain period before he can be employed in any lighter work.

3093. For what period?—He must have undergone nine months' separate confinement to begin with before he comes to us, and he must have undergone from at least three to six months' imprisonment on public works with good conduct, before he would be allowed to enter any of the lighter employments. That is the rule which I have adopted.

3094. (*Capt. Vivian.*) Do the men who come to you after their nine months' separate confinement come with a good or a bad character from their prison?—Always.

3095. And according to that I suppose you class them in the first, second, or third class?—They must in all cases serve 12 months in what is called the probation or lowest class. Then, if they have been

Capt. F. Powell.

14 May 1868.

perfectly well conducted for 12 months in that class, both in separate confinement and on the public works, they get into the third class. They then must be at least one year in the third class without committing any offence before they can get into the second class; and in like manner they must undergo another year before they can get into the first class.

3096. (*Chairman.*) What is your opinion with regard to the punishment of the dark cells; do you look upon it as a very deterrent punishment?—It is deterrent certainly as a rule, but some men will stand three days and almost laugh at you.

3097. (*Lt.-Gen. Scarlett.*) What punishment do you inflict for very violent insubordination?—Corporal punishment for attacking an officer, or very mutinous conduct.

3098. Do you consider that that is absolutely necessary?—I think that in a convict prison it is absolutely necessary.

3099. (*Chairman.*) Not having the power to discharge them out of the prison, you must deal with them by severe measures in the prison?—Just so.

3100. But is it not a very rare instance in which a man does not give in under confinement in dark cells?—I should say that in four cases out of five it would be very deterrent.

3101. Is it quite sufficient without recourse to corporal punishment?—Not in a convict prison.

3102. (*Lt.-Gen. Scarlett.*) Then you consider corporal punishment as the severest and the most deterrent punishment which you can employ?—I have no doubt of it.

3103. (*Capt. Vivian.*) Do you adopt the bread and water system?—Yes, and a director has the power of inflicting 28 days punishment diet. Punishment diet consists of bread and water for three days, and then a diet of porridge and potatoes for one intervening day.

3104. Do you find that a very effectual punishment? They dislike it very much.

3105. (*Chairman.*) Have you been speaking of entirely dark cells, or of only what are called obscure cells?—I have been speaking of entirely dark cells as regarded the three days.

3106. But you have known cases in which men are able to stand that?—I am sorry to say a great many.

3107. Do you share Colonel Henderson's opinion, that it would not be desirable in any case to let dark cells form a portion of the original sentence?—I should not myself consider that to be very material, so long as the governor of the prison has the power of inflicting it afterwards.

3108. Your are limited to three days by law, are you not?—We are.

3109. (*Capt. Vivian.*) What limit is there to your infliction of corporal punishment as a prison punishment?—It is only inflicted by order of a director, and 36 lashes is the amount which can be given.

3110. (*Chairman.*) You have to apply to London then to get an order?—A director almost invariably comes down and enters into the case himself.

3111. If there is a sufficiently bad case you inform the board of directors and one of the directors comes down?—I report the circumstances to the directors with the evidence, and one of them comes down and adjudicates upon the case.

3112. What number of cases have you in a year where you resort to corporal punishment now?—It has varied very much. You may recollect that some years ago there was an outbreak at Chatham prison; of course that was an exceptional case, but I think that for upwards of two years after that we had not a single corporal punishment; since then, speaking under correction, I should say that we have had an average of about a dozen a year.

3113. You are aware that the convicts were removed from the dock yards mainly to keep them out of contact with civilians?—That was one reason.

3114. And that they trafficked with the people in the dockyard?—They do so if they have the power to a very great extent, and highly objectionable it is.

3115. Do you think that it is a good plan to employ them in the camp in sight of their comrades?—I shoud say certainly not as an opinion.

3116. It must lighten the sentence to the individual and perhaps do away with the idea of its being so severe a punishment in the eyes of those who look on?—That is quite my opinion.

3117. Do you think that seclusion is the great point to be aimed at?—I do.

3118. (*Lt.-Gen. Scarlett.*) Do you think that the prison dress and the segregation of the men under the warders at work has no effect upon the troops as a deterrent?—I should consider separation much more deterrent.

3119. *Lt.-Gen. Eyre.*) Are you able to account for the apparent tendency to increase in the number prisoners committed just now to prisons?—I was not aware that there was an increase in that number.

3120. My impression is that the present state of the statistics is that there is an increase?—It must be quite lately, for there has been a decrease within a year or two in ordinary offences; however, it is very possible that quite lately such may have been the case; but, if so, I am not aware of it, as my prison is almost always kept full.

3121. But your practical knowledge of punishment will enable you to answer the same question as I put to a previous witness, which was this: Do you consider that crimes purely military should not be treated in the same way as those included in the ordinary code of morals, and that the punishment should be different?—I think it would be desirable.

3122. In Prussia for cases requiring very summary and sharp practice they have a kind of cell in which a man cannot remain in one position; have you any means of expressing an opinion in regard to the efficacy or desirableness of that?—I have no means of expressing an opinion from personal knowledge, but it is a cruel system that I should not like to see adopted in any of our prisons. I should shrink from it myself.

3123. Then what, in your opinion, is the most ready and suitable punishment for very bad cases of that sort requiring instant notice?—In the absence of corporal punishment I can only suggest a drum-head court-martial and immediate removal to imprisonment made as uncomfortable as possible short of cruelty.

The witness withdrew.

Capt. W. J. Stopford.

Captain Walter James Stopford called in and examined.

3124. (*Chairman.*) You are the governor of the convict prison at Portsea, are you not?—I am.

3125. Have you any experience of military prisons?—No, except from visiting them occasionally when I was in the army.

3126. Did you share the opinion which has been expressed by Colonel Henderson and Captain Powell, that it is absolutely necessary for a strict system of discipline to have a prison constructed upon the cellular plan?—Certainly.

3127. But without that you cannot make a short sentence really deterrent?—No, I am sure you cannot.

3128. What form of punishment have you in the convict prison at Portsea?—It is the same as all other convict prisons.

3129. It is a public works prison, is it not?—It is.

3130. You have no employment in the cells?—None; I was governor of Dartmoor convict prison for two years, and I had employment not exactly in the but in association in sheds, in picking oakum and basket making. It was light labour.

3131. That was almost entirely for prisoners who were not supposed to be physically able to undergo a severer sentence, was it not?—Yes.

Capt. W. J. Stopford.

14 May 1868.

3132. Do you think that it would be possible to carry out a really severe sentence in a prison which only contained 100 or 120 men?—I do.

3133. What proportion of them would be employed about the prison itself in light labour; would not a large proportion of them be so employed?—I should think not. I should think three would be quite enough as cleaners.

3134. What military prison have you inspected?—I have inspected several during my service. I have been at the Arbour Hill prison, in Dublin, but that was 15 years ago.

3135. Do you think that the military prison system there was severe?—It was at that time.

3136. Were they confined to cells?—I believe they were; whenever I have seen them in the prison I have seen them in the cells.

3137. But are you aware that in three military prisons now they have hardly any cells for separation?—I was not aware of that; I am speaking of about 15 years ago.

3138. Do you see any objection to making a certain period of dark cells part of the original sentence?—I can see no objection to it.

3139. In your experience has it a very deterrent effect?—Yes, I think it has.

3140. Next to corporal punishment it is the severest prison punishment, is it not?—If combined with the handcuffs it is. I consider the most deterrent punishment next to corporal punishment to be dark cells, in handcuffs.

3141. For what length of time are you allowed to inflict that punishment?—For 72 hours.

3142. And at what intervals may you repeat that sentence?—I am not sure that there is any period laid down, but I should not take upon myself to repeat it certainly under three or four days' interval, and I have only resorted to it in cases of violent conduct with insubordination, refractory cases.

3143. Do you find it sufficient punishment to most men, and that it is effective in bringing them round?—I think with the handcuffs it is, but I do not believe that it is at all a substitute for corporal punishment in prisons, though I consider that it is next to corporal punishment in its deterrent effects.

3144. What number of prisoners have you at Portsea?—I have 960.

3145. And what is the average of the sentences of corporal punishment in the prison there?—I can hardly tell you that, for I have been there only about a month; but at Dartmoor I had about 630. I should think that my average number of corporal punishments were about eight or nine in the year.

3146. (*Mr. Russell Gurney.*) For what offences generally is corporal punishment inflicted?—For open and violent assaults upon the warders.

3147. (*Chairman.*) Do you think it is possible or advisable to have more recourse to a diet of bread and water than is now done?—I should think not longer than 28 days at a time, which the directors give now.

3148. Do you often have recourse to it as a punishment?—I have recourse to bread and water punishment every day for short periods.

3149. (*Capt. Vivian.*) You put the prisoner upon what is called punishment diet?—Just so, that is bread and water.

3150. (*Chairman.*) And that is a punishment which they feel very much, is it not?—They do not like it. I suppose they feel it. They feel a long protracted period of bread and water, I know. The governor can only give three days' bread and water at a time, and the directors can give 28 days.

3151. (*Lt.-Gen. Scarlett.*) After 28 days do the men come out very much impoverished and unable to work?—They are of course rather weak from the punishment, but not very much so.

3152. But would you put them to the same labour as they previously were at?—They go to the same labour, but I have generally adopted the plan of telling the warders not to be too sharp upon them for the first two or three days.

3153. (*Viscount Eversley.*) Do you find them equal to the same labour after this diet?—Hardly equal.

3154. (*Lt.-Gen. Scarlett.*) Do you think that a soldier would be able to do his duty in the ranks after 28 days bread and water?—I should think he would certainly fall out after an hour's drill in heavy marching order.

3155. (*Chairman.*) But if he was retained in prison after his 28 days' bread and water, supposing it was a sentence for 42 days, by the end of that time he would be fit to work again if he went on the ordinary prison diet afterwards, would he not?—Quite so, I should think.

3156. And it would be a very deterrent sentence, would it not?—I think it would.

3157. You have no military prisoners in your prison, have you?—Yes, but not treated as such.

3158. (*Lt.-Gen. Eyre.*) Was not Dartmoor an experimental prison?—No; it was an invalid prison.

3159. What does that mean?—The men who are considered not to be actually fit for public works, that is to say, for such works as they are doing at Chatham, Portsmouth, and Portland, were sent there.

3160. (*Lt.-Gen. Scarlett.*) Have you any civilians working side by side with the convicts?—We have in the neighbourhood.

3161. What comparison would you make between the work done by the convicts and the work done by the hired men?—There are very many opinions about that. My opinion is that you can make a convict do just as much as a hired man under proper supervision, but he requires to be kept up to the mark, and so does the hired man as far as that goes.

3162. Do you in fact find at Portland, where they are employed on pretty much the same work I believe, that as much is done by 20 convicts as by 20 civilians?—I do.

3163. (*Capt. Vivian.*) What work do they do at Portland?—Brickmaking by steam machinery.

3164. Entirely brickmaking?—Almost entirely. There are men of course employed in carpenters' shops and blacksmiths' shops.

3165. Is that severe labour?—Brickmaking is very severe labour.

3166. (*Lt.-Gen. Eyre.*) Do you receive seamen in your prison?—Yes.

3167. Is there any difference with regard to the punishment awarded and carried out to them?—None.

3168. (*Chairman.*) What value do you think you get out of your prisoners at Portsmouth?—I should think that on an average each man earns 2*s.* per day.

3169. Have you made any return of the gross earnings of the prison in the last year or two?—A return has been made, but not by me, as I am a new comer there.

3170. But you get a great deal more value out of the public works at Portsmouth than at Dartmoor, where they work in cells?—Yes, it is more remunerative work. On Dartmoor we work also in the open air, but that is in reclaiming land for the Duchy of Cornwall.

3171. That is an agricultural operation?—Yes.

3172. (*Lt.-Gen. Scarlett.*) But that labour would be rather a pleasing occupation to the men, would it not?—It is pretty hard work, trenching and draining bog land.

3173. (*Lt.-Gen. Eyre.*) You have served in the army, and therefore you know well what cases arise requiring a very serious example?—I do.

3174. From your knowledge of those circumstances of military discipline, and also from your experience as the governor of a prison, and from your understanding punishments of all kinds, can you suggest anything at all applicable to cases requiring a prompt and effectual example?—Nothing is so prompt as corporal punishment.

3175. But that being out of the question, is there anything in lieu of it? There is in the Austrian army a punishment by which, in difficult cases, they bind a man in a cramped position for 24 hours, the

man being released for two hours after every six hours, the 24 hours including those reliefs; have you ever resorted to expedients of that kind in prisons?—What I have just mentioned is the nearest thing which I can think of to it, viz., to put a man in a dark cell with his hands behind his back in handcuffs.

3176. For how long?—We can give it for 72 hours, but whenever I have put a man under such punishment as that I have given instructions that he should be reported to me every six hours.

3177. Do you ever put him in for so many hours without relief of this kind, according to the Austrian plan?—I have put him in handcuffs for 72 hours, but not according to the Austrian plan.

3178. Do you consider that a very severe punishment?—I consider it very severe.

3179. Do you apply bread and water to it as well?—Yes.

3180. For how long?—Not more than three days with bread and water can be passed in a dark cell with those handcuffs.

3181. (*Capt. Vivian.*) You have the power to inflict that punishment yourself, have you not?—Yes.

3182. (*Lt.-Gen. Scarlett.*) Do you find that that generally subdues the man?—The irons will always subdue him.

3183. He is not anxious to go back again?—No, never. I have never seen one yet.

3184. (*Lt.-Gen. Eyre.*) From your knowledge as governor of a prison and as an officer, do you think that that would be an appropriate punishment in peculiar cases?—I think it is the most severe punishment that I have seen.

3185. (*Mr. Russell Gurney.*) Do you find that you have to inflict corporal punishment upon the same man more than once?—It is not generally done as a rule, although cases have occurred where the same man has deserved it.

3186. You feel that it would be useless a second time?—That is the general idea, I think. I think it is so myself. *Capt. W. J. Stopford.* 14 May 1868.

3187. Then it does not succeed in deterring him from the same offence?—Frequently it does not.

3188. Do you think that a man is more frequently deterred from the same offence by that, or by the bread and water and the three days in the cell?—Certainly they are more frequently deterred by corporal punishment.

3189. You more frequently have to repeat the other punishments, have you?—Yes, the imprisonment.

3190. With the dark cell?—Yes, we have to repeat that more frequently. We do not often have to repeat corporal punishment, but there are cases where the man deserves it, and in these cases he does not generally get it.

3191. You try something else?—Yes.

3192. (*Chairman.*) Do you ever repeat corporal punishment upon the same man more than twice in prison?—I could not speak for certain whether it has been done or not, if so it has only been in one or two cases.

3193. When you employ prisoners in gangs on public works, how many warders go to a gang?—I generally put about 10 per cent., as Colonel Henderson mentioned. We have 100 warders to about 1,000 men.

3194. One warder to 10 men?—Yes, that is the average; but we sometimes have a warder to 25 men, and on the other hand we may only have a warder for five or six, according as they may be employed; but I do not think that one man ought to have more than 25 under his charge.

3195. Are your dark cells so constructed that the prisoners cannot be heard?—They are.

3196. That is a great element in the dark cells, is it not?—Yes.

3197. They know that any noise they may make in the cell will not be heard outside?—Exactly. It is a great inducement to a man to make a noise if he knows that he is heard by his fellow prisoners.

The witness withdrew.

Adjourned to Monday next at 11 o'clock.

Aldershot, Monday, 18th May 1868.

PRESENT:

COLONEL THE RIGHT HON. J. WILSON PATTEN, IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL EYRE.
CAPTAIN THE HON. J. C. W. VIVIAN.
JOHN LLOYD WHARTON, Esq., *Secretary.*

SERJEANT-MAJOR A. called in and examined. *Serjeant-Major A.* 18 May 1868.

3198. (*Chairman.*) This is a commission to inquire into courts-martial and military punishments, and we are anxious to obtain the opinion of the non-commissioned officers and men at Aldershot on those subjects. Your name will not be given, and we hope that you will give your evidence in as independent a manner as possible. You are a serjeant-major, are you not?—I am.

3199. How long have you been in the army?—I have been in it 13 years and three months.

3200. How long were you a private?—About a year.

3201. How long were you a corporal?—I was in the band nearly three years, and then I was promoted to corporal; I was lance-corporal thirteen months, full corporal a year, serjeant a year, colour-serjeant six years, quartermaster-serjeant nearly one year, and then I was promoted to be serjeant-major, the rank which I now hold.

3202 In the course of your experience in those posts which you have now described, have you seen much of the system of courts-martial, and first of all of regimental courts-martial?—Yes, a good many.

3203. From your experience have you been led to believe that there is a feeling of satisfaction, or otherwise, amongst the non-commissioned officers and men of the army as to the justice with which those courts are conducted?—I should think that the non-commissioned officers of the army do not approve of the regimental courts-martial; there is many a non-commissioned officer who gets reduced to the ranks for a very simple crime, and it is a loss to him for the remainder of his service; whereas another soldier would get so many days confinement to barracks. There is no punishment for the non-commissioned officer unless trial by a court-martial.

3204. Do you think that the desire of non-commissioned officers is, that some punishment should be adopted to obviate the necessity of reducing them to the ranks?—Yes, just so.

3205. Could you suggest any punishment for non-commissioned officers?—There are two or three that I would name; one is by being tried by a court-martial. Supposing a serjeant was in his fifth, or fourth, or third year of service, he would be deprived for ever afterwards of obtaining the medal and gratuity for

Serjeant-Major A.

18 May 1868.

long service and good conduct, even if he served 25 years longer.

3206. (*Capt. Vivian.*) Notwithstanding that he is reinstated in his rank?—He would never gain it.

3207. (*Chairman.*) Is the whole term of service never counted on restoration to non-commissioned rank?—No, he can never obtain that. We had an instance of it in our own regiment; we had an old colour-serjeant who had been there, as man and boy, 24 years, and he was tried by regimental court-martial, and now on going away he has not got the medal and cannot get it, and will not get it.

3208. Do you believe that a non-commissioned officer would lose more influence in the regiment be being reduced to the ranks and restored subsequently to the post of non-commissioned officer, or from being punished as a non-commissioned officer without reduction? Which do you think would be looked upon as the most damaging to his character amongst the men whom he would have to command?—It would be a great loss to the non-commissioned officer, because if he is once reduced he has a penny a day good-conduct pay taken away for a certain length of time.

3209. But my question has reference to the influence which he would have in the performance of his duty over privates?—I do not think it would make much difference in that respect.

3210. Do you think that there would be no difference?—It would if his crime was a serious one, and it was a just punishment for him to be reduced to the ranks.

3211. Do you think that a non-commissioned officer who has been punished as a non-commissioned officer would not lose that respect on the part of the men which he enjoyed before?—He would decidedly lose it.

3212. But would he lose it more than if he were reduced to the ranks and restored subsequently to his former rank?—No.

3213. (*Capt. Vivian.*) That would depend upon the nature of the crime, would it not?—That would depend upon the nature of the crime.

3214. If a non-commissioned officer was found guilty of drunkenness, as a matter of course he would lose his influence amongst the men?—He would.

3215. But if he only overstayed his leave two or three hours it would not be so?—That would be a different thing.

3216. (*Lt.-Gen. Peel.*) You say that a serjeant when tried by court-martial can never afterwards attain the medal and the advantages which he would have had by not being tried by court-martial?—Never.

3217. It is the mere fact of his having been tried by court-martial that deprives him of those advantages, is it not, without reference to the offence which he may have committed, and without reference to the punishment?—It is the fact of his having been tried by court-martial.

3218. (*Chairman.*) You have spoken of the injurious effect which it has upon the non-commissioned officer when sentenced by court-martial—will you state whether you think that there is a feeling amongst the privates and the non-commissioned officers generally in the army that strict justice is done, generally speaking, and that the soldier has fair play?—Yes, he has very fair play. Unless the evidence is sufficient to convict him he has very fair play.

3219. (*Capt. Vivian.*) With regard to regimental courts-martial, is it the same?—Just the same.

3220. (*Chairman.*) Do you think that in the long run they get fair play?—They do.

3221. Supposing that a soldier has the choice, whether he will be tried by a civil magistrate or by a court-martial, which do you think that he would prefer?—Most likely being tried before a magistrate.

3222. Why do you think so?—Several soldiers are tried for drunkenness now. That is the crime chiefly tried by regimental court-martial. There might be a doubt about the man's being drunk, although two evidences would state on oath that he was drunk. He might have been drinking, but not have been exactly drunk, so that he would have to be tried by court-martial; whereas if the same crime was brought before the magistrate there would be perhaps a fine of 5*s.* or 10*s.*

3223. It is the punishment then that makes you think that he would prefer the civil tribunal?—Of course.

3224. (*Lt.-Gen. Peel.*) The fact of his being drunk or not drunk would be decided by court-martial, would it not?—If there were two evidences that he was drunk, and if he brought 20 to prove that he was not drunk, he would be convicted.

3225. (*Chairman.*) But do you think that a man tried for drunkenness would have a better chance of getting off before a magistrate?—I do.

3226. With regard to crimes which subject soldiers to penal servitude, do you think that they would prefer deing tried by a civil tribunal or by a court-martial?—By a civil tribunal, I should say.

3227. On what grounds?—Perhaps they would have a better chance of getting off or getting a lighter punishment.

3228. Do you speak from experience?—No, I cannot speak from experience of civil life; it is merely what I have read from the newspapers of the nature of crimes in civil life, and what I know of the nature of crimes in military life.

3229. Then from what you have read you believe that a crime committed in civil life is less severely dealt with by the civil tribunal than it is in the army by a court-martial?—I think so.

3230. Is it in your power to adduce any instances of that?—I could not remember any at present.

3231. Do you believe that a soldier feels, when he is brought up before a court-martial, that he has every justice done to him as regards any defence which he may have to make?—Yes, I think he does.

3232. Do you think that that is a general feeling amongst the soldiers?—Yes, I should say so. Before his trial comes on the soldier is asked if he has any witnesses to call in his defence, and if so those evidences are collected and they are present on his trial for him to call in to prove anything on his behalf, so that he has every fair play in that respect.

3233. In your experience do you think that a private soldier always has an opportunity afforded to him of making his defence?—Yes, always.

3234. Have you known cases where the court have taken the part of the prisoner?—No, not to my knowledge.

3235. (*Capt. Vivian.*) You know that sometimes the commanding officer thinks that the sentence passed on a soldier is not sufficiently severe, and he reassembles the court for the purpose of revising that sentence, do you think there is any feeling on the part of soldiers that that power of the commanding officer is ever exercised unduly?—I cannot say what the feelings of the men who are tried are, but I believe that such a feeling does actually exist.

3236. You are aware that commanding officers have power to reassemble regimental courts-martial for the purpose of revising their sentences?—Yes.

3237. Sometimes with the object of making the sentence more severe?—Yes.

3238. Do you believe that a feeling prevails in the army that that power of the commanding officer is exercised unfairly?—I do think so.

3239. (*Lt.-Gen. Eyre.*) If a court-martial had the power of reducing a serjeant to the bottom of the list of serjeants, or to the rank of corporal, would that be acceptable to the serjeants?—It would.

3240. Would such a proceeding prevent a serjeant being respected as heretofore by the men, or would it damage his influence?—No; he is still a non-commissioned officer. If he was only a lance-corporal he would be respected as a non-commissioned officer just the same as he would be as a serjeant. His authority would not be the same as a serjeant, but he would still be respected as a non-commissioned officer.

3241. Do you consider that in court-martial cases where there is a doubt of any kind or description in the case, the court-martial has a leaning towards the prisoner or against the prisoner?—That would be rather a strange question to answer. I do not think that they would have anything against the prisoner.

3242. If they felt a doubt how would they lean, in your opinion?—They would give the prisoner the benefit of the doubt.

3243. What would be the view of the serjeants if there was the power of fining them in certain cases, giving them in such cases the power to appeal to a court-martial?—That would be a change for the better.

3244. (*Lt.-Gen. Peel.*) But if the court-martial had the power, as suggested by General Eyre, of reducing a serjeant to a corporal, still the effect of his having been tried by a court-martial would prevent, according to the present regulation, his ever getting good-conduct pay or the medal, would it not?—It would.

3245. What power has a commanding officer now with regard to the punishment of a non-commissioned officer without a court-martial?—One would be that he could remove him down ten steps on the roll of serjeant or to the bottom of the roll of serjeant, and it would be a certain length of time before it came to his turn for promotion again.

3246. Does promotion come by seniority among the serjeants?—Yes; according to seniority, if they are qualified for the next promotion.

3247. Were you senior serjeant when you were made serjeant-major?—I was not; but those on the top of the roll before me were not qualified for the situation.

3248. Then it is by selection, and not by seniority?—Yes. Had the non-commissioned officers first on the roll been qualified they would have got the situation.

3949. But if the commanding officer had the power of inflicting a punishment which would not render it necessary for the man to be tried by court-martial, you would think it an improvement on his being tried by court-martial, which necessarily brings with it a heavier punishment in the form of deprivation of advantages?—I would.

3250. (*Mr. Headlam.*) I think you said that the opinion of the men was generally that they had fair play before courts-martial?—Yes; I can only state what I think myself; I think myself that they have fair play.

3251. Do you ever recollect a case where the opinion of the men was that a man who was innocent had been found guilty?—No, never to my recollection.

3252. (*Marquis of Hartington.*) You mentioned trials for drunkenness; do you think that men have been hardly treated by courts-martial on charges of drunkenness?—Yes, I think they have.

3253. Have they been convicted on rather slight evidence?—Sometimes.

3254. (*Mr. Headlam.*) That is on the point as to whether the man was really drunk or not?—Yes.

3255. When it has been proved that he has been drunk?—Yes, I have seen two non-commissioned officers state to me when a man was late coming in at tattoo that he was drunk; and to convince myself I see the man myself, and my opinion would be quite different from those non-commissioned officers. I have often seen a man get off in that case, unless they have confined the man without my seeing him, or some one else. The general opinion might be that the man was not actually drunk; but if that had been his fourth time he would have been tried by court-martial.

3256. I suppose that the man in the case you mean had been drinking?—He had been drinking, but not to call drunk; he was not incapable of doing anything.

3257. (*Lt.-Gen. Eyre.*) Have you seen any cases in which prisoners were acquitted when the whole of their comrades knew that they were guilty men?—No, I never knew a case.

3258. (*Chairman.*) What, in your opinion, is the punishment which is most effective in maintaining discipline in the army at present; corporal punishment being done away with, what is the punishment which they dread the most?—I suppose it is imprisonment.

3259. With hard labour?—With hard labour.

3260. Do you know anything of the punishments in military prisons?—I have very little acquaintance with the prison regulations. There is one description of punishment they do not like, and that is solitary confinement.

3261. If you were to select a punishment which you think would make the most impression upon a soldier, would you select solitary confinement?—I would.

3262. Rather than the prison hard labour?—Yes.

3263. Have you had any instances where solitary confinement has been carried to any extent within your knowledge; and what is the longest punishment of solitary confinement that you have ever heard of as being inflicted?—Five days and seven days.

3264. By a sentence of a court-martial?—No, by order of the commanding officer.

3265. What is the longest number of days that you have heard of by sentence of a court-martial?—That all depends upon how the sentence is. The punishment by court-martial is not solitary confinement; they may sentence to so many days, I believe, but I am not sure abont that.

3266. (*Capt. Vivian.*) Does solitary confinement carry with it punishment diet?—It does.

3267. Bread and water?—Not bread and water exactly.

3268. (*Chairman.*) For drunkenness could you suggest any punishment, other than that now in vogue in the army, which you think would have an equally corrective effect, such as stopping of pay, for instance?—Yes, that is a punishment which a soldier does not like.

3269. Do you think that it would have a better effect in stopping drunkenness than the punishment to which a soldier is now subject?—I do.

3270. Do you think that amongst non-commissioned officers of your own class that opinion would prevail?—I do.

3271. What, in your opinion, is the punishment which can be inflicted summarily with the greatest effect, on the line of march for instance?—The punishment would be slight that could be inflicted on the line of march.

3272. Have you had much experience of corporal punishment in your regiment?—I have known several cases in India.

3273. As a serjeant-major, have you any fear of being unable to maintain the proper discipline of your regiment now that that punishment is done away with?—No, none whatever.

3274. What punishment would you suggest to be inflicted in these cases for which corporal punishment has been the sentence?—I should think solitary confinement.

3275. Is a soldier put into irons when he is in solitary confinement; is he handcuffed?—No, he is merely confined in the cell alone by himself.

3276. (*Capt. Vivian.*) It is not a dark cell, is it?—I cannot mention how the prison is, in some prisons the cells are dark.

3277. But the solitary confinement you speak of is not what they call the dark cell system?—Yes, the cell would be dark, but it would be ventilated.

3278. (*Chairman.*) In your experience have you found that, wherever your regiment has been quartered, there are the means of inflicting a punishment of that kind?—Yes, there are always the means.

3279. And you think that is generally the case both in England and in India, and in our colonies?—I do.

Serjeant-Major A.

18 May 1868.

3280. Is there no difficulty anywhere in inflicting solitary confinement?—It could always be inflicted.

3281. (*Lt.-Gen Eyre.*) Has there been any serious case of insubordination within the last two or three months in your regiment?—One only.

3282. What means were resorted to on that occasion?—A man was tried by general court-martial at Aldershot and sentenced to two years' imprisonment and dismissed the service.

3283. (*Chairman.*) Does your observation that the soldier has generally fair play in a court-martial, apply as well to regimental, to district, and to general courts-martial?—Yes, I think it does.

The witness withdrew.

Troop Serjeant-Major B.

TROOP SERJEANT-MAJOR B. called in and examined.

3284. (*Chairman.*) The Commission wish me to inform you that your name will not be given, and they hope you will give your evidence here with the greatest independence. No notice whatever will be taken of whatever evidence you give conscientiously as a soldier. You are a troop serjeant-major, I believe?—Yes.

3285. How long have you held that post?—Two years.

3286. How long have you been in your present regiment?—I have served 14 years in this regiment. I have been 19 years in the service altogether.

3287. How long as a private?—Seven years as a private.

3288. And how long as a non-commissioned officer?—Ten years as a serjeant and serjeant-major, and two years as a corporal.

3289. During that time have you always been in England?—No.

3290. Have you been abroad?—I have been in the East Indies for five years, and in the Crimea.

3291. During that time you have had considerable experience, I presume, with regard to courts-martial; that is to say considerable experience as to knowing the feelings of the men with regard to courts-martial?—Yes.

3292. Is it your opinion that amongst the non-commissioned officers and soldiers of the British army there is a feeling that they have fair play when they are tried by a court-martial?—Not among the non-commissioned officers.

3293. In what way do the non-commissioned officers think that they have not play?—Because they have to be tried for that for which a private soldier would get a few days' confinement to barracks.

3294. And you think that the non-commissioned officers feel that they ought to be some punishment for non-commissioned officers without reduction to the ranks?—Yes.

3295. Do you think that that is the general feeling?—I think it is.

3296. In your regiment, for instance, do you think that a serjeant who had been punished by a court-martial or otherwise, as a serjeant would still retain sufficient respect on the part of the men to preserve discipline?—Do you mean a serjeant after he is reduced?

8297. Supposing a non-commissioned officer was tried by court-martial and found guilty and punished as a non-commissioned officer, do you think he would lose that respect which is necessary to a non-commissioned officer to preserve discipline?—No. If he is a respectable man he will try and regain his rank.

3298. But supposing, now, that you were tried by a court-martial without being reduced to the ranks and punished as a non-commissioned officer, without being reduced to the ranks, do you think that you would be able to preserve discipline in your regiment afterwards?—It is according to what punishment I received.

3299. Is it not according to what crime you are convicted of?—If I lost my crown as a serjeant-major, and were reduced to serjeant, then of course I should have the same power almost.

3300. (*Lt.-Gen. Peel.*) It is not a question of power, but it is a question of respect. Would the men look up to you with the same respect after you had lost the crown as they did before?—No, the more you have authority the more you are respected.

3301. (*Chairman.*) Do you think it would impair the efficiency of a non-commissioned officer to be tried by a court-martial if he was reduced to the ranks on his being found guilty?—I think not.

3302. In your opinion it depends very much upon the crime for which the man would be found guilty?—Yes.

3303. If it was a serious crime he would of course lose respect, but if it was a trifling crime you do not think he would?—I do not think so.

3304. (*Lt.-Gen. Peel.*) But, according to the present regulations, the very fact of your having been tried by court-martial would prevent you getting good-conduct pay, would it not?—Yes.

3305. That is what the non-commissioned officers principally object to, is it not?—It is.

3306. (*Capt. Vivian.*) They cannot get the medal under any circumstances?—Yes, if they are tried in the first three years of their service.

3307. But after five years service?—No.

3308. (*Lt.-Gen. Peel.*) Then if a commanding officer had the power of inflicting punishment on a non-commissioned officer without trying him by court-martial, you think that would be preferable to trying non-commissioned officers by court-martial?—Yes.

3309. (*Chairman.*) Do you think that the privates of the army feel confident that they have justice administered properly under the present system of courts-martial?—Yes, I think they have from what I can learn.

3310. Supposing that, unfortunately, you committed a serious crime in your regiment, would you prefer to be tried by a court-martial or by a civil tribunal, if you were a private soldier?—It is according to the crime. I might deserve more punishment than the commanding officer is able to give, and then of course he would have to try me by a court-martial.

3311. Do you think that there is a feeling amongst the soldiers of the British army that when they are brought for trial before a court-martial they have every facility to defend themselves in their trial?—Yes. Some men make a very good defence.

3312. And you think full justice is done to them in their defence?—Yes.

3313. Have you had opportunities in your experience of seeing whether there is any general leaning for or against a prisoner on his trial?—I never have.

3314. Do you think that there is a feeling in the army that the trials for drunkenness are conducted fairly?—Yes, but that is not left to the commanding officer. A man must be tried for the fourth offecer.

3315. As troop serjeant-major in your own regiment, do you believe that the crime of drunkenness could be punished in any other way than at present without injuring the discipline of the army, supposing the necessity of trying a man by court-martial on the fourth time of being drunk was done away with, and some punishment could be inflicted?—Yes. If those men were allowed to remain with the other men they would corrupt the others of course.

3316. Do you think that it is a necessary rule that a man for the fourth time of getting drunk should be tried by court-martial?—Yes; they are best away from the men altogether.

3317. Supposing that the punishment of stoppage of pay were inflicted for drunkenness, do you think that that would have a bad or a good effect?—A very good effect. They would not be able to get the money to spend.

3318. (*Capt. Vivian.*) Do you think that it is a better punishment for drunkenness than putting a man

in prison?—Yes; you would stop his pay after he came out of prison. I should punish him and stop his pay for a certain time of course. A man now when he is tried for drunkenness generally loses a penny a day for 168 days.

3319. (*Chairman.*) What, in your opinion, is the punishment which is most effectual in preserving discipline in the army; what punishment is it that a soldier dreads the most?—I think imprisonment with hard labour.

3320. Do you think that the common imprisonment with hard labour or solitary confinement is the most dreaded?—Hard labour, I should think.

3321. More than solitary confinement?—Yes.

3322. Have you had much experience of soldiers who have gone through solitary confinement?—I have.

3323. Have they expressed their feelings to you upon the punishment at all?—Yes.

3324. And the same with regard to hard labour?—Yes.

3325. And you think that the hard labour is the most dreaded?—Yes.

3326. What is the kind of hard labour which you think is the most dreaded?—Shot drill.

3327. Have you any doubt about that?—I have none.

3328. Do you think that is the general feeling?—I do.

3329. Have you the means of inflicting shot drill wherever you go in your regiment?—Where there is a regimental cell.

3330. Have you ever inflicted shot drill where there has been no regimental cell, as for instance on the line of march or anywhere in outlying quarters?—No.

3331. Was that because it could not be inflicted?—It could not.

3332. At all quarters can you inflict solitary confinement?—Yes; I think in every quarter where I have been there has been a regimental cell, and wherever there is a regimental cell of course there can be shot drill.

3333. (*Viscount Eversley.*) Is the bread and water diet much dreaded by the soldier?—Yes, but the men dread hard labour most I think.

3334. (*Mr. Headlam.*) Have you ever heard of a man being convicted of being drunk who was not drunk?—I never have.

3335. (*Mr. Mowbray.*) Have you had any experience of cases of trials for embezzlement?—No.

3336. You do not know what the feeling in the army is as to whether men are fairly tried for making away with necessaries, or stealing, or embezzling money?—I never knew a case of embezzling money in my regiment.

Troop Serjeant Major B.

18 May 1868.

3337. (*Lt.-Gen. Eyre.*) If a commanding officer had the power of awarding to a non-commissioned officer some kind of punishment instead of trying him by court-martial, could you suggest any kind of punishment instead of making non-commissioned officers undergo the usual punishment of defaulters?—No.

3338. Would you not regret to see a non-commissioned officer so classed as to undergo punishments of that kind?—Yes.

3339. (*Marquis of Hartington.*) Do you know of cases where soldiers have been sent to prison, and came back and made good soldiers afterwards?—Yes.

3340. Frequently?—Yes, frequently.

3341. You would not like to get rid of a man always after he has been punished for any serious offence?—No.

3342. Do you know men who have suffered corporal punishment and made good soldiers afterwards?—Yes, on service.

3343. But not at home?—No, I do not know of any.

3344. Do you think that it would be a good thing to be able to get rid of bad characters more easily?—Yes; I think it would be a very good thing.

3345. Are there not some men in every regiment with whom you never can do any good?—Yes.

3346. (*Capt. Vivian.*) And they corrupt other men?—Yes, they corrupt other men. Some men are always in prison.

3347. (*Lt.-Gen. Eyre.*) How many men would you put down in that category, of whom you would like to get rid, in your regiment?—There are about six such men in the regiment now, I think.

3348. (*Capt. Vivian.*) They are pretty well known in every regiment, are they not?—Yes; there are very few such bad characters in my regiment.

3349. (*Lt.-Gen. Eyre.*) And that would weed you satisfactorily of them?—Yes, I think so.

3350. (*Chairman.*) Do you think a man is ever tempted to commit crime or to act in a disorderly manner for the sake of being sent to the right about?—No.

3351. And you do not think it would have that effect if more of the bad characters were dismissed from the army?—I do not think it would.

3352. (*Marquis of Hartington.*) Would those bad characters like to be discharged?—I do not think they would. I often meet men as we march about the country who have been discharged, and they say that they are very sorry that they have been discharged.

3353. (*Chairman.*) What is the strength of your regiment?—About 600. I have not the exact strength.

The witness withdrew.

TROOP SERJEANT-MAJOR C. called in and examined.

Troop Serjeant-Major C.

3354. (*Chairman.*) The Commission wish me to inform you that they hope you will give your evidence with the greatest independence and freedom. Your name will not be given, so that you need not dread any consequences from expressing yourself freely and independently. How long have you been in the army?—Thirteen years on the 28th of March last.

3355. Will you state the length of your services as private and non-commissioned officer?—I was private for eight years, and I have been non-commissioned officer five years.

3356. How long have you been serjeant?—I was four years and four months a serjeant-major, and I became serjeant-major the 1st of this present month.

3357. Have you been abroad as well as in England?—I was 10 months in Turkey at the time of the Crimean war in 1856.

3358. Have you been in India?—No.

3359. Nor in the colonies?—No.

3360. Have you known much of courts-martial while you were in the service?—I have known several who have been tried by courts-martial.

3361. Can you inform the Commission whether among those soldiers with whom you have come in contact during the time that you have been in the army there is a feeling that they have fair play in a trial before court-martial?—They consider that they get a fairer trial in a district, or garrison, or general court-martial than they do on a regimental court-martial. That is the general feeling, I think.

3362. What is the objection which you think is entertained to a regimental court-martial?—I have no objection to it myself, but I have heard them say that if a man is put back for a regimental court-martial he is a doomed man. They think that they will not get the benefit of the doubt in a regimental court-martial.

3363. But that they would on a district or a general court-martial?—Yes.

3364. Could you from your own experience say whether you think that that opinion is well founded?—As far as I have seen or known I have nothing to complain of.

3365. You think that justice is done indifferently

Serjeant-Major C.

18 May 1868.

in the regimental courts-martial as well as in the others?—Yes.

3366. In what way do you think that the soldier looks upon a regimental court-martial as dooming him?—They think that the commanding officer is biassed against them, and that he would have more power in a regimental court-martial of punishing them than on a general court-martial.

3367. The feeling of a soldier is that the commanding officer has too much influence in the decision of a regimental court-martial?—Yes.

3368. Have you known in your experience any decisions of regimental courts-martial revised by the commanding officer?—No.

3369. But I suppose that they are revised sometimes, are they not?—They are revised sometimes. If the court recommends the prisoner, after reducing him, to be reinstated, the commanding officer generally acts upon that and reinstates him.

3370. Do you know of any instance where a commanding officer has revised the finding of a court-martial and has directed the court to reconsider its finding?—Yes.

3371. Is there any feeling on the part of the soldiers upon that point?—No. The commanding officer has revised it and pointed out cases where they have given a wrong verdict, and the president of the court might have reduced the man; or perhaps when he has tried him he has only reprimanded him; and I have known cases of the commanding officer pointing out to the president that he must reduce him, that he could not sentence him to be reprimanded.

3372. Do you think that that creates a feeling amongst the soldiers?—Yes.

3373. (*Captain Vivian.*) Are you expressing now the general opinion which you have gathered from the men?—Yes.

3374. That a commanding officer, if he chooses, may lay a regimental court-martial against a soldier with a sentence more severe than just?—Yes.

3375. (*Chairman.*) Do you think that the men are aware that the sending of the finding of a court-martial to be reconsidered by the court does not involve the necessity of the court altering the sentence?—No, I believe that the president of the court can still adhere to his former finding. They are not bound to alter it on account of the commanding officer pointing out to them their mistake.

3376. Then your only objection is as to the influence which the commanding officer is supposed to have upon the court?—Yes.

3377. (*Lt.-Gen. Peel.*) When you talk about reducing and reprimanding you are talking about non-commissioned officers being tried by courts-martial, are you not?—I consider when a man is tried by a regimental court-martial that the colonel can influence the officers upon the court.

3378. Have you had any experience of regimental courts-martial except in your own corps?—No, I only speak the general talk of the men, but I speak of all corps.

3379. (*Chairman.*) Is it your opinion that an alteration might take place with regard to the punishment of non-commissioned officers without reducing them to the ranks?—Yes, I have known cases where a corporal has been able to do his duty exceedingly well and has given satisfaction, and when he has been promoted to the rank of serjeant he has not given such satisfaction as was expected of him, he was not able to do it, and they have, perhaps, got him tried by court-martial to reduce him to the ranks from being a serjeant; whereas if he had reverted to his former rank in which he had given satisfaction, that would give him a better trial to be promoted to the rank of sergeant again, unless it was a severe case.

3380. (*Lt.-Gen. Peel.*) But that is a trial on account of incapacity, and not on account of having committed any crime?—Yes.

3381. Do you think that it would be an advantage that you might put him back to the rank of corporal instead of being obliged to reduce him to the ranks?—Yes.

3382. But that man has committed no crime, and therefore if he went back to the rank of corporal he would still retain the same influence with the men as a corporal which he had before?—Yes, and he would get the chance of getting his promotion as a serjeant, perhaps, after a little more probation.

3383. If he were tried by a court-martial for getting drunk, or anything of the kind, and was reduced to the rank of corporal, he would not have the same influence with the men as he had before, would he?—No.

3384. (*Lt.-Gen. Eyre.*) With reference to your observations about regimental courts-martial, if your commanding officer had exactly the same power in his hands as a regimental court-martial, would you, as a prisoner, prefer to be dealt with by him, or by the regimental court-martial, both having the same power to deal out the punishment?—I might feel aggrieved and I might prefer to be tried by court-martial to being dealt with by the commanding officer, but as far as my experience goes I have been always satisfied with the decision of my commanding officer.

3385. (*Chairman.*) In your corps I believe you have not a great deal of punishment, have you?—Not as much as I have heard of in other corps.

The witness withdrew.

Bombardier D.

BOMBARDIER D. is called in and examined.

3386. (*Chairman.*) The Commission wish me to request you to give your evidence with the utmost independence and to state your opinion upon the questions put you without the least fear of its being noticed hereafter. Your name will not be given, and we do this in the hope that you will speak with the utmost freedom and independence. How long have you been in the artillery?—Eight years.

3387. You are a bombardier, are you not?—I am an acting bombardier.

3388. Have you been quartered in England during the whole of your service?—No, only about two years.

3389. Where have you been besides?—In India.

3390. Have you had any opportunities of forming an opinion as to the feeling which exists among non-commissioned officers and privates with regard to the justice which is administered in courts-martial?—Yes, a good many.

3391. Do you think that the general feeling is that justice is strictly administered in those courts?—Yes, I have never heard any complaints about injustice.

3392. Do you think that a prisoner going before a court-martial has every means afforded him of conducting his defence?—Yes.

3393. Do you state that with regard to general courts-martial, district courts-martial, and regimental courts-martial?—There may be an advantage taken by a commanding officer on a regimental court-martial.

3394. What advantage do you think may be taken in a regimental court-martial which is not taken in the others?—A commanding officer might not like a man, and might take advantage because there was no officer of another corps there; he might take advantage of that.

3395. What power, if he wishes to take advantage, do you think that the commanding officer has of carrying out his views?—They are the officers of the regiment and he may influence them in their opinion, that is all.

3396. You think he might influence the judgment of the officers of the regiment, they being officers of his own regiment?—Yes, but I have always consi-

dered myself, that a regimental court-martial was fair, I have never seen any injustice.

3397. (*Capt. Vivian.*) You are speaking of the impression upon the men's minds generally in the army, are you not?—Yes, I have heard complaints. I have not heard complaints of any injustice being done, but I have heard mention that injustice could be done by a regimental court-martial.

3398. (*Chairman.*) Have you ever heard a man say when he has been tried by court-martial that he has not had the means of conducting his defence?—No.

3399. And you think it is the general feeling that there is ample means of a man's defending himself?—Yes.

3400. (*Marquis of Hartington.*) I suppose you have heard complaints made of the severity of a sentence, have you not?—Yes, of course, that is according to opinion. A man would say, whether he was right or wrong, that he got a severe sentence.

3401. But is it often the opinion among the other men that a sentence has been too severe?—I cannot say that it has.

3402. (*Lt.-Gen. Eyre.*) Have you ever known a man to be found guilty when his comrades knew him positively to be innocent?—No, I cannot remember that I have.

3403. (*Marquis of Hartington.*) A great many of the cases which are tried by regimental courts-martial are cases of drunkenness, are they not?—Yes, a good many.

3404. Do you think that a man has a fair chance if he is tried on a charge of drunkenness?—Yes, according to military law he has a fair chance of obtaining justice.

3405. (*Chairman.*) Do you think that any other punishment could be administered for the crime of drunkenness?—Yes, I consider that a man's pay should be stopped, because if his pay was stopped he could not get drunk, he would have no money to get drunk with.

3406. And inasmuch as when he is drunk he cannot perform his duty to his country?—No; when he is drunk he cannot perform his duty, and his comrades have to perform his duty besides their own, and it is double duty for them.

3407. How do you think such an alteration would be acceptable by privates in the army?—I think it would be very acceptable instead of courts-martial.

3408. Do you think that it would tend to check drunkenness more than the present system does?—Yes; because if a man has not the money he cannot get drunk. A few do, but I do not know how they do it.

3409. (*Capt. Vivian.*) And if a man gets drunk, his comrades have to do his duty while he is in prison?—Yes. If my comrade is put into prison, I must do his duty besides my own.

3410. (*Chairman.*) In your opinion is drunkenness on the increase or on the decrease at the present moment in the British army?—I consider it is on the decrease.

3411. Very much?—Yes; there is not near so much drunkenness; in fact, I consider that the army is getting more enlightened than it was when I joined eight years ago.

3412. And you think that it is to that that the decrease of drunkenness is to be attributed?—I do.

3413. (*Lieut.-Gen. Peel.*) Your experience has been in India, has it not?—Yes.

3414. Is there any difference there as to discipline? It is stricter here.

3415. What, in your opinion, is the punishment which is most efficacious in the army, corporal punishment being done away with?—I think that corporal punishment should be done away with, it degrades a man, and he never thinks anything of himself afterwards. It takes away with his pride in himself.

3416. What punishment do you think is the best substitute for corporal punishment?—I know of no other except imprisonment.

3417. Do you believe that imprisonment, with hard labour or solitary confinement, has the most effect upon the soldier?—Solitary confinement, I should say.

3418. Do you think that they dread that more?—Much more.

3419. In your corps have you always the means of inflicting solitary confinement?—Yes.

3420. Do you imprison a man in irons in a case of solitary confinement?—No, in a cell.

3421. Without irons?—Without irons.

3422. (*Capt. Vivian.*) You put him upon short commons; bread and water?—No; that is if he commits himself in prison, as a prison punishment.

3423. (*Chairman.*) Do you think that the punishment of being put on bread and water would have a good effect if it were carried out more than it is now?—It is according to the man who is being punished.

3424. Do you think that they dread that punishment much?—I cannot say much about their being punished by bread and water. They dread the solitary confinement.

3425. And not the bread and water?—Not so much.

3426. (*Lieut.-Gen. Eyre.*) If you were on a detachment and were responsible for that detachment, and had a bad case of insubordination (perhaps the case of a man knocking down a serjeant), what would you think the most effectual way (you having the power) of dealing with him promptly, as an example to his comrades, and also as a punishment to the man?—There could be nothing done to him, unless he was made a prisoner, until it was investigated by the officers of the regiment. Nothing that I know of could be done with him.

3427. But supposing you yourself had the power of dealing with him summarily, what would you do?—I do not see anything that could be done, except making him a prisoner at once, until the officers investigated his case. A non-commissioned officer would have no power.

3428. But if he were brought before you to be dealt with, what do you think would be the most effectual punishment for gross insubordination with violence?—I should say that he should be severely punished.

3429. But what is the severe punishment which you would inflict?—Imprisonment. I know of nothing else for a crime like that.

3430. (*Marquis of Hartington.*) Do you know any men in your regiment who have been imprisoned?—Yes.

3431. Are they good soldiers now?—Some are. We have had one on whom we had a court-martial about six months ago. He deserted from the regiment, and was away about 18 months, and tried his hand at everything; and when he came back he got imprisonment for 84 days, I think it was, and now he makes a first-rate soldier. He has seen the justice of his punishment.

3432. (*Chairman.*) Do you think that that is frequently the case?—Yes, very often, if a man is away, and sees that he cannot better himself out of the service, as in the case of this man, he is content to come back again, and sees he cannot do anything better.

3433. (*Lt.-Gen. Peel.*) Did he deliver himself up, or was he taken?—Well, he says he was taken; but I suspect he gave himself up, and he could not do better.

3434. (*Chairman.*) Do you think that he did that with his eyes open, knowing that he should have this severe punishment as a deserter?—Yes, he knew that he would be punished severely for being away 18 months.

3435. Is there any difficulty in getting recruits for your service?—We have for gunners. The gunners' standard is 5 feet 8 inches.

Bombardier D.

18 May 1868.

3436. Was this man a gunner?—No, a driver. A driver works harder than a gunner.

3437. But do you think that there is a general desire to get into your corps?—There is.

3438. (*Marquis of Hartington.*) I suppose you know some bad characters, who are always in trouble?—Yes, I know plenty who are always in trouble; but they would always be in trouble wherever they were. It is not through discontent with the service; they would be in trouble if they were civilians.

3439. Do you think that it would be satisfactory to the men in general if they could be got rid of?—Yes, it would be. Men who are always in trouble give their comrades trouble and annoyance in bringing them their meals, and so on; I hear many complaints against men in my subdivision who are always in trouble.

3440. Do you think that if it were the rule to discharge bad characters more frequently than now, men would commit crimes in order to get discharged?—As the service is now, I think that very few men would commit a crime to get discharged.

3441. Would not those bad characters most of them like to be discharged?—I do not see that they would like to be discharged. They cannot keep from being bad characters; they cannot keep from committing themselves; and, as I said before, they would commit themselves wherever they were. They would like the service, but they cannot keep from committing themselves.

The witness withdrew.

Corporal E.

Corporal E., called in and examined.

3442. (*Chairman.*) The Commission wish me to request you to give your answers to any questions which may be put to you with the greatest independence; your name will not be given, and you need not be at all afraid of any consequences from speaking your mind in the freest possible manner. No notice whatever will be taken of what you say, and we hope you will give your evidence before us according to your own feelings, without reference to anything else. How long have you been in the army?—Nine years and seven months.

3443. How long have you served as a non-commissioned officer?—Five months as an effective non-commissioned officer.

3444. Has your service been chiefly in England, or abroad?—I served two years abroad.

3445. Where?—In India, at Madras.

3446. And during the remainder of the time have you served in England?—Yes.

3447. During your service have you had many opportunities of judging of what the feeling of the soldiers and non-commissioned officers of the British army is with regard to the mode in which justice is administered in courts-martial?—Yes, I have.

3448. What do you think is the feeling?—I think in one instance, of drunkenness, it could be done better than by trial by court-martial. I think deducting some of their pay would have more effect.

3449. But you think that the feeling is that justice is strictly administered?—Yes.

3450. And that would apply equally to regimental district and general courts-martial?—Yes.

3451. Do you think that the feeling amongst the soldiers is that a man tried by a court-martial has a fair means of defending himself?—I think so.

3452. Do you think that feeling is general?—Yes.

3453. And you do not hear any complaints against the fairness of the Court, but merely as to the punishment inflicted for crimes?—No.

3454. With regard to drunkenness, what is it that you would wish to suggest as to the punishment?—Instead of trying a non-commissioned officer for drunkenness, for instance, if he got drunk he might, perhaps, be reduced from serjeant to private. If a private gets drunk it is overlooked, and he gets punishment drill, for the first once or twice perhaps; and I think instead of trying that by court-martial, deducting some of their pay would be much better, and it would perhaps tend to decrease drunkenness.

3455. Do you think a non-commissioned officer ought to be punished without reduction to the ranks?—I would make them revert to a lower rank.

3456. But not to the rank of a private soldier?—No.

3457. Do you think that is a general feeling throughout the non-commissioned officers?—I do not think I could answer that question.

3458. What is the peculiar hardship in a non-commissioned officer being reduced to the ranks for the crime of drunkenness, inasmuch as a non-commissioned officer who gets drunk would lose his influence over the men; do you think that a non-commissioned officer who was punished for drunkenness without being reduced to the rank of a private soldier would afterwards maintain his influence over the men?—I think he would not let the drunkenness occur again. I think that he would try and rise again and retain his influence over the men still.

3459. Supposing the punishment for drunkenness was altered in the army, and stoppage of pay was inflicted as a punishment for that offence, do you think that that would be considered fair?—I think it would tend to decrease drunkenness better than courts-martial, because a court-martial throws a man's duty upon his comrades.

3460. What, in your opinion, is the punishment that a soldier dreads the most?—Going to prison, I should think.

3461. With hard labour?—Yes.

3462. And you think he dreads imprisonment with hard labour more than solitary confinement?—I should think so.

3463. Have you had an opportunity of hearing the opinions of men who have gone through the punishment of solitary confinement?—Very often.

3464. And also of those who have gone through hard labour?—Yes.

3465. And it is your opinion from what you collect from them that they dread hard labour more than solitary confinement?—Yes.

3466. Does not that in some degree, however, depend upon the disposition of the man punished?—I do not know. I have often heard them pass remarks about men who have been waiting sentence. They say, "He will not like it in prison, the hard labour in "carrying shot."

3467. Then you think that the shot drill is what they dread most?—I think so.

3468. (*Capt. Vivian.*) Do you think it is a good thing that flogging is done away with in the army?—I think it is a very good thing.

3469. You do not think there is any fear of the discipline of the army being weakened by its being done away with?—Oh, no.

The witness withdrew.

Private F.

Private F. called in and examined.

3470. (*Chairman.*) The Commission wish me to state to you before you answer any questions put to you that they hope you will give your answers with the strictest independence, and that you will state your opinions as freely as possible. Your name will not be given and you will incur no notice whatever as to the opinions which you give before us, so that we hope your answers will be given without any fear whatever. How long have you been in the army?—Ten years.

Private F.

18 May 1868.

3471. Have you always served in England?—Always in England.

3472. Have you had any means of forming an opinion upon what is the feeling of the privates of your regiment or of any other regiment with regard to the mode in which justice is administered in courts-martial?—I fancy the opinion generally entertained is that it is not a very just mode.

3473. How so?—I cannot say that I can give you the reason why they should arrive at that opinion, but such appears to be the opinion.

3474. Did you ever hear any reason assigned for that opinion?—I have heard (though it may be a foolish reason) that if you are put back by the colonel for a regimental court-martial you are sure to be punished.

3475. Have you ever known, in your own experience, a man whom you knew to be innocent found guilty in a regimental court-martial?—I cannot say that I have.

3476. The feeling, however, that you allude to is that the colonel of a regiment has too much influence with the court?—The men are under that impression.

3477. That in a regimental court-martial the colonel biasses the opinion of the court?—Yes.

3478. Do you think that there is the same feeling with regard to a district court-martial?—No.

3479. Nor a general court-martial?—Nor a general court-martial.

3480. Do you think the feeling amongst the privates is that in district courts-martial and general courts-martial strict justice is done?—I do.

3481. (*Marquis of Hartington.*) I suppose a man is not very often tried by a regimental court-martial unless his crime is pretty clear?—No, as a general rule he is not.

3482. (*Chairman.*) As a general rule a man is seldom tried by a regimental court-martial unless he is guilty?—A man may go before the colonel and deny the charge, and then the colonel may send him before a court-martial, and they will prove whether he is guilty or not.

3483. (*Marquis of Hartington.*) A great many regimental courts-martial are in cases of drunkenness, are they not?—The principal part of them are cases of drunkenness and absence.

3484. Do you think that a man is ever found guilty of habitual drunkenness on too slight evidence?—Not of habitual drunkenness, but of drunkenness he may be, perhaps.

3485. Do you think it is cases of that sort that make the dissatisfaction you speak of?—I think so.

3486. (*Lt.-Gen. Peel.*) What would be the effect upon the men of stoppage of pay for drunkenness?—I think it would have a very beneficial effect.

3487. Do you think it would be dreaded more than imprisonment?—I think it would be dreaded more than imprisonment.

3488. (*Mr. Mowbray.*) Have you conversed with many privates on this subject to-day?—No, I was not aware what I was wanted here for.

3489. You give your own opinion, but you do not come to represent other people's opinions?—Not at all.

3490. (*Mr. Headlam.*) Have you ever known a man convicted for being drunk when you thought he was not drunk?—I do not think I have.

3491. Have you never heard a case where a complaint was made either by the prisoner himself or by any other man, that a man had been convicted for being drunk when he was not drunk?—I have heard men state so afterwards with respect to themselves.

3492. But you never heard anybody say that he thought that anybody else had been hardly used?—No.

3493. (*Viscount Eversley.*) Do you think that drunkenness is on the increase in the army, or not?—I can hardly form an opinion. I should say that the number of courts-martial are now, of course, more prominent than they were formerly, in consequence of their trying them on the fourth chalk.

3494. (*Chairman.*) Do you think that amongst the privates it would have a more deterring effect from drunkenness if you were to inflict the punishment of stoppage of pay instead of trying them by court-martial?—I do.

3495. What, in your experience, is the punishment usually inflicted by a court-martial for drunkenness on the fourth occasion as a first punishment?—A stoppage of one penny a day for 28 days, or 42 days imprisonment and a stoppage of pay for 168 days.

3496. (*Lt.-Gen. Eyre.*) Do you think it is a good thing for the army that flogging has been done away with?—I think it is. There are some cases though, I think, in which it should not be done away with, such as theft.

3497. (*Chairman.*) You would recommend that it should be kept up for theft?—Yes.

3498. (*Lt.-Gen. Peel.*) Theft among the soldiers?—Yes, theft among the soldiers.

3499. (*Mr. Headlam.*) Is that the general opinion amongst the soldiers?—I believe it is the general opinion.

3500. (*Capt. Vivian.*) Do you not think it would be a good thing to get rid of a thief?—It would be a very good job to get rid of him.

3501. I suppose what his comrades would like would be to get him kicked out of the regiment as soon as possible?—Certainly.

3502. (*Chairman.*) Is there any strong feeling of honour on the part of a soldier not to rob his comrades?—Yes, I think so.

3503. What would be the treatment amongst the soldiers themselves of a man whom they found robbing?—If they were not afraid of the consequences they would flog him themselves.

3504. (*Capt. Vivian.*) Therefore you think flogging need not be maintained for the purpose of keeping up military discipline, but only in the case of such a disgraceful crime as robbing a comrade?—I do.

3505. But do you not think it necessary in order to keep up military discipline, that a man should be flogged?—I think not. I think that discipline can be carried on without it.

The witness withdrew.

The Provost Serjeant.

The Provost Serjeant called in and examined.

3506. (*Chairman.*) What rank do you hold?—I am acting serjeant-major of police.

3507. (*Lt.-Gen. Eyre.*) Are you provost marshal?—No, he is my senior.

3508. (*Chairman.*) Will you give the Commission your opinion as to the nature of the punishments which are most dreaded by the soldiers?—Imprisonment and solitary confinement.

3509. Which should you say was the more dreaded, solitary confinement, or imprisonment with hard labour?—Solitary confinement generally.

3510. What is the proportion of hard labour inflicted under your observation which the soldier dreads the most?—They do not undergo that punishment under the military police here.

3511. You have no knowledge of what goes on in the prison?—No.

3512. In your opinion is the crime of drunkenness increasing or on the decrease?—Increasing, I think.

3513. In Aldershot?—Rather.

3514. Have you filled your present post at any other place than Aldershot?—No.

3515. To what do you attribute the increase?—I attribute it to the extra pay. There has been a slight increase since the extra pay.

3516. Are you speaking from certain information on that point?—I am speaking from what I have seen.

3517. Have you any detailed returns which you could give the Commission, of punishments for drunk-

The Provost Serjeant.

18 May 1868.

enness?—The provost marshal has a diary which could be produced.

3518. What is your especial duty?—I go on patrol in the camp and in the vicinity; and I confine all soldiers for any irregularities committed, such as drunkenness, disorderly conduct, absence without leave, and desertion.

3519. Does the performance of your duty throw you much in the way of the privates?—Yes.

3520. Have you opportunities of judging of their feelings?—Yes.

3521. Have you opportunities of knowing what the feelings of the privates are with regard to justice as administered by courts-martial?—That they get a fair trial.

3522. Do you think that the general feeling is that when a man is put upon his trial he has fair means of defending himself?—I do.

3523. And that the sentences awarded are on the whole given with fairness?—Yes.

3524. You think that that is the general feeling?—I do.

3525. (*Marquis of Hartington.*) What kind of offence is that for which you generally confine men? What is the most common offence?—Drunkenness and absence chiefly.

3596. Do they generally go together?—No.

3527. Are there a great many cases of absence when the men are not drunk?—Yes, there are.

The witness withdrew.

Private G.

PRIVATE G. called in and examined.

3528. (*Chairman.*) We do not ask your name and your name will not be given. We wish you to give answers to any questions put to you with entire independence and without fear of any consequences which may occur to you. We want your own individual opinion upon the points which we shall put to you. How long have you been in the army?—I enlisted on the 17th of February 1860, about eight years and four months ago.

3529. Has your service been in this country or abroad?—In New Zealand and in this country.

3530. How long in this country?—Since the 10th of August 1866.

3531. Have you had an opportunity during your service of judging of the feeling of the privates of the British army with regard to justice as it is administered in courts-martial?—I have been tried on two occasions myself and I never had any fault to find with them.

3532. What was the crime for which you were tried?—The first time was for disobedience to orders. I was a non-commissioned officer then and I was reduced to the ranks. The next time was when the regiment was under orders for England, and as I happened to be at Melbourne I did not wish to come back to England and I deserted.

3533. Were you tried by courts-martial on both those occasions?—By district courts-martial on both occasions.

3534. Did you feel on those occasions when you were before the court that you had the power of defending yourself?—Not except under extenuating circumstances.

3535. Did you feel that you had the power of urging in your defence everything which was material?—I made a defence; I handed it in and I believe it was accepted by the court. It was read by the president of the court; that was the first occasion.

3536. Had you any complaint to make afterwards of the court not having administered justice fairly to you?—Not the slightest.

3537. Of how many officers did the court consist?—I cannot recollect correctly now; about six or seven, I should think.

3538. Was the president a field officer?—A field officer was president of the court.

3539. Did you plead guilty?—I did not; I pleaded not guilty.

3540. (*Lt.-Gen. Peel.*) What was the nature of your disobedience of orders?—It was a colour serjeant that directed me to take down stores which the company required, and I happened not to do it at the moment.

3541. It was a case on which a doubt might arise as to whether you had been guilty of disobedience of orders, or not?—Yes.

3542. (*Chairman.*) And you thought that you were not guilty?—I could not say that I did it. Of course as I did not do it I was guilty.

3543. (*Viscount Eversley.*) But you had perfectly fair play, had you?—I had fair play.

3544. (*Chairman.*) Where were you tried for desertion?—In New Zealand.

3545. Did you plead guilty upon that occasion?—I did not plead guilty on that occasion because there was a discrepancy in the date. I happened to desert on the 8th of November, and they charged me upon the 9th.

3546. Did you get off upon that plea?—No, the date of my desertion was previous to what was in the charge. I think that was the reason that it was no use.

3547. You say that you believed that you had fair justice done to you in those courts, do you believe that that is the feeling generally amongst soldiers with whom you have been in the habit of living?—I cannot say positively. I had no objection whatever to make. I was guilty of both charges, and I was found guilty.

3548. (*Marquis of Hartington.*) Is a regimental court-martial generally supposed to be a fair court?—I cannot say. I never have been tried by a regimental court-martial.

3549. But you have heard it talked about by the soldiers, I suppose?—Well, men may have different opinions. I cannot say.

3550. (*Lt.-Gen. Eyre.*) Have you ever seen a man found guilty whom you knew to be innocent?—I never have.

3551. (*Mr. Headlam.*) Not of drunkenness?—No. I have seen men acquitted by courts-martial, but whether they were guilty or not I had no personal knowledge.

3552. (*Chairman.*) What punishment do you think that the privates of the British army consider the most severe?—I could not say. The only punishment I had myself was imprisonment for desertion.

3553. How long imprisonment had you?—Fifty-six days.

3554. With hard labour?—Yes.

3555. What was the nature of the labour?—The nature of the labour was shot drill so many hours a day, and working through the camp.

3556. Which of those did you dislike the most?—The shot drill the most.

3557. Do you think that that is the general feeling?—I think it is.

3558. With regard to punishments for drunkenness do you think that the punishment of stoppage of pay instead of being tried by a court-martial for the fourth offence would have the effect of checking drunkenness more than the present punishment?—I think it would. I am almost certain that the stoppage of pay would stop it more than pack drill or anything of that sort, or even being tried on a fourth occasion.

3559. (*Lt.-Gen. Eyre.*) And it would save you from doing the drunken man's duty?—Certainly.

3560. (*Chairman.*) Do you think that it would be popular in the army among the good soldiers if a drunkard were punished by stoppage of pay?—I think so, because if a man happens to get drunk he is confined to barracks very likely, and not allowed to

go out, and he saves the pay coming round during that time, and when he is at liberty to come out of barracks again he has this pay to spend, and very likely he will get drunk again.

3561. (*Marquis of Hartington.*) Would you like the colonel to have the power to stop a man's pay for drunkenness?—I do not know. I have never seen any injustice on the part of a commanding officer yet.

3562. Would the soldiers like that the colonels should have that power, and that they should have an appeal to a court-martial?—I could not say. Men would be of different opinions. Some might consider that the colonel might act unjustly, and others might be of a different opinion.

3563. (*Capt. Vivian.*) Supposing a drunkard had his pay stopped by his colonel, and he thought that it was unjust on the part of the colonel, and he had power to appeal to a court-martial, then he could not complain of the injustice of the colonel, could he?—He would be afraid to make anything in the nature of an appeal to a court-martial, because if he happened not to prevail, as is likely, he would be charged for making a false charge against the commanding officer, or something of that kind.

3564. His commanding officer would remember it against him?—I do not think that a man would choose to make an appeal if he considered himself unjustly acted upon. I think he would sooner bear any little thing which he might consider injustice than make an appeal.

Private G.

18 May 1868.

3565. (*Lt.-Gen. Peel.*) You were tried for having deserted on the 9th; whereas you deserted on the 8th?—Yes.

3566. Supposing that you had been tried for having deserted on the 8th and you had not deserted until the 9th, do you think that you would have got the advantage of that?—I think I should.

3567. Were you therefore perfectly satisfied with the justice of the court?—Perfectly satisfied. Having deserted on the 8th I was a deserter on the 9th.

3568. (*Chairman.*) What do you believe to be the general feeling of the good soldiers with regard to corporal punishment?—Well, I cannot say. I hear men expressing different opinions upon it. For instance, I often hear the men say that in case a man committed certain crimes he deserved it.

3569. (*Capt. Vivian.*) For what crimes?—For instance, if a private soldier stole property belonging to another; some of them do.

3570. (*Mr. Headlam.*) Any other crime?—Yes, assaults of indecency, or anything like that.

3571. Have you heard that opinion expressed?—I have often heard the men talking about it, and saying that in such cases he does deserve it.

3572. (*Chairman.*) With reference to maintaining discipline, do you think that corporal punishment is necessary?—I do not think with regard to discipline that it has ever deterred any one from the commission of any crime. I do not think they ever think of the consequence when they commit any crime.

The witness withdrew.

PRIVATE H. called in and examined.

Private H.

3573. (*Chairman.*) The Commission desire me to tell you that they hope that you will answer any questions which may be put to you without any fear of consequences to yourself. Your name will not be asked and will not be given up, nor the regiment to which you belong. How long have you been in the army?—Since November 10th, 1863, four and a half years.

3574. Has your service been in England the whole time?—No.

3575. Where?—In New Zealand.

3576. Have you had any opportunities of judging what the feeling of the private soldier is with regard to the justice administered in courts-martial, do you believe that the soldiers think they have a fair trial when they are brought before a court-martial?—I think they do.

3577. You have never had the misfortune to be tried by a court-martial?—No.

3578. Do you think that that feeling is the same with regard to regimental courts-martial as well as to district courts-martial and general courts-martial?—Yes.

3579. (*Capt. Vivian.*) Is there any opinion among any comrades of yours that a commanding officer has a power sometimes over a regimental court-martial which he may work against the men, have you heard such an opinion expressed by others?—No.

3580. (*Mr. Headlam.*) Have you ever heard a complaint about commanding officers having too much power?—No.

3581. (*Chairman.*) Your belief is that when a man is to be tried by regimental court-martial he gets full justice on his trial?—Yes.

3582. (*Capt. Vivian.*) Have you ever heard men say that he is a doomed man if he goes before a regimental court-martial?—No.

3583. (*Mr. Mowbray.*) Have you ever known men get off who have been tried by regimental courts-martial?—Yes.

3584. Have you ever known a man unjustly convicted in your opinion by regimental court-martial?—No.

3585. (*Mr. Headlam.*) Have you ever known a man tried for drunkenness when he was not drunk?—No.

3586. (*Chairman.*) Do you think that the punishment for drunkenness might be altered with advantage, do you think that the stoppage of pay might be inflicted for drunkenness with good effect?—Yes.

3587. You think that it would deter the crime of drunkenness?—Yes.

3588. More than the present mode of punishment?—Yes.

3589. What punishment do you think that the soldier dreads the most of any?—I think prison.

3590. With hard labour or solitary confinement?—Solitary confinement is the worst.

3591. Do you think that is the portion of the punishment which he dreads the most?—Yes.

3592. What sort of hard labour do you think he dreads the most, shot drill or the other hard work?—I think shot drill.

3593. In your experience have soldiers who have gone through the punishment of imprisonment with hard labour afterwards turned out good soldiers?—Yes.

3594. You think that it does not necessarily take away from a man's character as a good soldier to have been subjected occasionally to the punishment of imprisonment?—I do not.

3595. What crime do you think in the army is looked down upon with the greatest abhorrence by the soldier?—Pilfering.

3596. (*Mr. Headlam.*) Do you ever hear any men talking about corporal punishment being done away with?—Yes.

3597. What do they say about it?—They say that it is very good that it is done away with.

3598. And you think that it is a very good thing?—Yes.

3599. Do you make any exception with respect to any crime?—No.

3600. The general opinion was that it was a good thing that it was done away with?—Yes.

3601. (*Lt.-Gen. Eyre.*) Would you like to flog men if they steal?—Yes, I think it would be just to flog them.

3602. (*Capt. Vivian.*) I suppose you would sooner kick a thief out of a regiment?—Yes.

3603. Men do not like to associate with thieves?—No.

The witness withdrew

Adjourned to Thursday next at 1 o'clock.

Room E. House of Lords.

Thursday, 21st May 1868.

PRESENT:

COLONEL THE RIGHT HON. J. WILSON PATTEN, IN THE CHAIR.

VISCOUNT EVERSLEY.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
COLONEL S. N. LOWDER.
CAPTAIN THE HON. J. C. W. VIVIAN.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

Lt.-Col. W. Agg.

21 May 1868.

LIEUT.-COLONEL WILLIAM AGG called in and examined.

3604. (*Chairman.*) I believe you are at present in command of the 51st Regiment?—I am.

3605. How long have you held that command?—Upwards of four years.

3606. Have you served in any other regiment but the 51st?—Never.

3607. How long have you been in the regiment altogether?—Between 17 and 18 years.

3608. Will you state to the Commission what has been the practice in your regiment with regard to the instruction of officers in military law?—The practice has been that young officers invariably attend courts-martial as supernumeraries for about six months.

3609. That is according to the regulation, is it not?—Yes. Two years used to be the time laid down. They are not supposed to be members of district courts-martial for a longer period, but on regimental courts-martial we generally put them after six months, and they are supposed by that time to have worked up the Mutiny Act and the Articles of War, and to be perfectly capable of acting as members of a court-martial; but I think the system generally defective. I do not think that officers are so well up in military law as they should be.

3610. According to your experience in the army is it a general practice to pass subaltern officers through an examination in military law?—They have to pass for their lieutenancies examinations in military law.

3611. Before a board?—Before a board of field officers.

3612. Of whom does that board consist?—Of three field officers.

3613. Are they chosen indiscriminately from the army?—They are chosen from the brigade, but officers of their own regiment are not put on except in some cases when they cannot get others.

3614. Does an officer go through that examination on promotion to the rank of captain, as well as from ensign to lieutenant?—He does.

3615. Is it stricter in one case than in the other?—It is stricter for his promotion to captain.

3616. What is the nature of the examination?—On the Mutiny Act and Articles of War and powers of courts-martial, &c.

3617. And the customs of the army?—Yes, and the customs of the army.

3618. You have said that you think that the system i sdefective. In what respect do you think that it is defective?—I do not think that officers have an opportunity of working up military law so well as they should. In fact I know no officer is so well acquainted with military law as he should be. He can go by the Mutiny Act and the Articles of War, and they are clear and concise so far, but I do not think officers' general knowledge of military law is so good as it should be.

3619. But the Mutiny Act and the Articles of War and the Queen's Regulations taken altogether are involved in a little obscurity at the present time, are they not?—I think they are, rather.

3620. Do you think that it is advisable that as a first step the Articles of War and the Queen's Regulations should be simplified?—I do not think that altogether. I think they are simple, but at the same time as to the laws of evidence and other points I do not think officers on courts-martial can get a correct and precise opinion enough, from their not understanding the law of evidence principally. I think that is the defective part of it.

3621. What amendment of the system would you suggest? Would you suggest that there should be a public examiner?—There are books published, we know, on the law of evidence, but they are too elaborate to study, unless an officer went in regularly to study the law, and officers among their various duties have not time to do that; but I think there ought to be some book published on the whole system of courts-martial.

3622. What is the book by which courts-martial are chiefly guided at the present moment?—The Mutiny Act and the Articles of War.

3623. What are the books which are chiefly referred to?—Simmons is the great book.

3624. (*Capt. Vivian.*) But that is not an official authority, is it?—No, it is not considered an official authority. There was a work, by Pipon which was referred to, but then that was found to be not correct in many points and was disregarded.

3625. "Simmons on Courts-martial" is accepted by some courts, and by other courts it is rejected, is it not?—Yes, we accept it for want of a better, On many points we cannot obtain the information required from the Articles of War and the Queen's Regulations, and we have at times to refer to other works, and we refer to Simmons.

3626. But it is no authority, is it?—It is the work to which I always refer.

3627. (*Lt.-Gen. Peel.*) Do you consider that you have no responsibility as commanding a regiment for the fitness of an officer before he is appointed to sit on a court-martial?—Yes, and I should most certainly not appoint a man whom I considered not fit to sit on one.

3628. Do you examine an officer yourself before he is allowed to sit on a court-martial?—He is examined by the adjutant. My subalterns are always examined once a week by the adjutant, and if he reports to me that any officer is not fit I should not appoint him to sit.

3629. Therefore there is that security that before a young officer is allowed to sit on a court-martial he is examined in military law?—Undoubtedly.

3630. (*Lt.-Gen. Eyre.*) As an experienced commanding officer of a regiment with a view to taking a further step in the direction of having officers well instructed in a duty which I daresay you will agree with me is, if not of the very highest importance, one of the most important on which officers could be employed, would you approve of all officers before they undertake that duty being examined by a board specially named for that particular branch of their duty, there being upon that board, in addition to the other field officers, a Deputy Judge Advocate?—Most certainly.

3631. (*Lt.-Gen. Peel.*) It would necessarily tend to an officer's making himself better acquainted with the subject if the examination were to take place, would it not?—Yes.

3632. (*Chairman.*) According to your experience are these sentences of regimental courts-martial often revised?—I very seldom revise them, unless of course from my greater knowledge of the men; if I think the sentence is extreme I remit part of it, but I generally abide by the sentence awarded by the court,

3633. Have you ever revised a court-martial with a view to the increase of the punishment?—I have done so, but very seldom; I was talking with regard to the sentences.

3634. Have you ever revised the finding of a court-martial?—I have done so, but not for some time; not within the last two or three years, I think.

3635. Do you think that it is advisable to maintain the practice which now exists of revising the sentence of a court-martial with a view to the punishment being increased?—I do not, because in the majority of cases I think the court would abide by their former decision.

3636. But does it not sometimes happen that they do not?—It might happen that they may have overlooked a very vital point in the case and may have made a mistake.

3637. Do you think it is advisable to retain that power with a view to correcting those mistakes?—Perhaps it is, but my opinion is not strong upon that point.

3638. In your experience I think you say it is a very rare occurrence?—It is a very rare occurrence.

3639. And you, yourself, have seldom done it?—Very seldom indeed.

3640. Do you think that it would tend to the better discipline of a regiment if, in place of the frequent regimental courts-martial which now take place, greater power was given to the commanding officer, giving always the power of appeal to the prisoner?—I do think so. I think that the commanding officer ought to have much greater power.

3641. From your knowledge of the private soldier do you think that it would create any dissatisfaction if greater power were given to the commanding officer?—I do not think that it would at all. A court-martial ruins many a good soldier. When he is once tried he often gets disgusted with the service.

3642. I believe that now the only appeal which a private soldier has from a commanding officer to a court-martial, is in the case of stoppage of pay?—That is the case.

3643. Can he now claim a court-martial in any case?—Only when his pay is affected.

3644. (*Capt. Vivian.*) Do the men often appeal?—Very seldom. I have only had one case.

3645. (*Chairman.*) Have they the right of appeal now?—Only where it affects their pay.

3646. Should you see any objection to giving them a right of appeal in other cases besides those of the stoppage of pay?—I should be against giving that.

3647. If the power of the commanding officer was increased in all matters relating to discipline, should you see any objection to giving to private soldiers a right of appeal to courts martial?—I would not give it him.

3648. (*Capt. Vivian.*) What is the present power of a commanding officer of punishing non-commissioned officers?—He has no power beyond giving them extra guards or on picquet, or extra orderly duties for irregularities.

3649. He cannot reduce a non-commissioned officer from one rank to another?—The only grades are lance corporal or lance serjeant, and they are not recognized as ranks.

3650. A commanding officer has at present no power over non-commissioned officers, except to try them by courts-martial, has he?—No.

3651. What is the power of a commanding officer with regard to the private?—He can stop his pay for any number of days not exceeding five; he can imprison him for any period not exceeding 168 hours with or without hard labour or solitary confinement, or he can confine him to barracks for any period not exceeding 28 days. The solitary confinement is very seldom given.

3652. Are the powers of commanding officers equal in all regiments?—They are equal.

4653. In the exercise of them I suppose they vary very much?—I fancy that they vary very much.

3654. Different crimes are punished by very different punishments in different regiments?—

3655. To what extent do you think that the power of the commanding officer should be increased?—I am of opinion that the commanding officer should have power to stop a man's pay for a month; I should let him have $8\frac{1}{2}d.$ for his rations and nothing else, and give the commanding officer the privilege of stopping 15*s.* in the month; I would not exceed that. Then the man would have his food and nothing more.

3656. What power have you now of confinement in cells?—168 hours, that is a week.

3657. To what extent do you think that it would be advisable to increase that power of the commanding officer?—I should certainly double it, or I should even say to one month's imprisonment.

3658. Civil magistrates have now the power of giving 28 days cells, I think?—I think to a month a commanding officer should have the power.

3659. You would extend the power of the commanding officer to a month?—I would.

3660. If the power of the commanding officer were extended in the way which you suggest, do you think that the discipline of the regiment might be maintained without any regimental courts-martial at all?—I do. I think that would be a very good plan.

3661. (*Lt.-Gen. Peel.*) If the power of commanding officers were extended to giving the same punishments as are now awarded by regimental courts-martial, the power of appeal to a court-martial being given to the man, should you approve of that plan?—I would not give any appeal; I would allow him to give 28 days, and at the general inspection, if the commanding officer has done anything wrong, the colonel is answerable for it.

3662. (*Chairman.*) Do you not think that that would cause some dissatisfaction in the army?—I do not think it would.

3663. (*Lt.-Gen. Peel.*) For instance; supposing a man disputed his having been drunk and wished for an inquiry as to the fact before a court-martial, would you not give him a power of appeal from the decision of the commanding officer?—No; I think the best system to adopt would be, that when the man's case was brought up the adjutant should take a short summary of the evidence, and have it filed and kept for a year; and if there was any doubt about the case, the man would have his appeal to the General at the inspection, and the General would look into the evidence, and would judge for himself whether it was sufficient, or not, to convict the man upon.

3664. At all events, you would give the man the power of adducing evidence before the commanding officer?—Certainly, I would give him the power of calling what defence he has.

3665. (*Lt.-Gen. Scarlett.*) You said, did you not, that you would give him no appeal?—I said I would give him no appeal. A commanding officer might fine a man for irregularities, for small cases of drunkenness, or absence, 5*s.* or 10*s.*; but I think that stopping days' pay causes great trouble in the accounts, and that it would be better, therefore, to fine men by stated sums, and that, if a man was fined over 5*s.* for anything, then he might have a right of appeal.

3666. But not unless it affected his pay?—Not unless the fine exceeded 5*s.*

3667. (*Capt. Vivian.*) If the power of the commanding officer was increased to the extent which you propose, would you desire that there should be any regulations as to the way in which prisoners should be brought up in the orderly room, that is to say, that the captain of his company, the adjutant, and the serjeants, should be present while his case was being gone into?—I think that is the case now. When a man is brought up now, I always have the captain of his company, unless he is away on duty, or has leave to be absent, and then the subaltern is there.

3668. What records of those proceedings are kept?—No records whatever, except the guard report, but not the evidence.

Lt.-Col. W. Agg.

21 May 1868.

3669. But would you propose, supposing the commanding officer's power was extended, as you suggest that any record should be kept of the evidence produced by the prisoner?—Certainly.

3670. (*Lt.-Gen. Scarlett.*) Would you take that evidence upon oath?—That is a point which would require consideration. I consider that anything over the present power of commanding officers, which is seven days, ought to be taken on oath.

3671. In fact you would put a commanding officer in the same position as a magistrate with sworn evidence before him?—Yes.

3672. (*Lt.-Gen. Eyre.*) In case the power of commanding officers were increased in the manner which you have been suggesting, would you, in proportion, give greater power to the captains of companies?—Yes, I think that the captains of companies ought to have power equal to seven days confinement to barracks; and, with regard to my former evidence on the last point, I think that in any case in which probably a prisoner would be imprisoned, the evidence should be taken upon oath.

3673. (*Chairman.*) You think that all evidence should be taken on oath?—All evidence, if a man was going to be imprisoned, should be taken on oath.

3674. To whom would you give power to administer that oath?—I would administer the oath myself, or the adjutant might do it. It would be best to give that power to the commanding officer, to allow him only to be able to administer the oath.

3675. (*Lt.-Gen. Scarlett.*) Do you happen to know the power of a commanding officer in the French service?—I do not.

3676. (*Lt.-Gen. Eyre.*) Supposing that no alteration should be made in regard to regimental courts-martial (that is to say, as to dispensing with them,) and that no more power was given to commanding officers than they have now, would you suggest any improvement in the present constitution of regimental courts-martial?—No, I am against regimental courts-martial entirely.

3677. But I am supposing that it was not considered desirable to abolish regimental courts-martial and that they were continued; in that case would you alter their present constitution, would you have upon them more experienced officers than now, or anything of that kind?—Yes, I think a field officer and a captain, and a subaltern only, would be quite sufficient.

3678. Would that, in your opinion, in a manner obviate the objections which exist now?—It would.

3679. (*Lt.-Gen. Scarlett.*) What are your objections to regimental courts-martial?—I think very often when a man is sent up for trial members know their power, they give 42 days and 28 days. If a man is known to be a bad character he gets 42 days, and if not, he gets 28 days as a matter of course. I have said already that I do not think that they are so well up in military law as they should be.

3680. Have you any reason to complain of your officers at any time in carrying out your wishes?—No, I have had nothing to find fault with in them; I never submit a case to a court-martial unless I think it is quite clear.

3681. (*Capt. Vivian.*) You are compelled to try a man now for drunkenness after the fourth time, are you not?—We are having the option of referring the matter to the General, and he may allow me to deal with the case if I could say anything in the man's favour as being a good man in other respects.

3682. Supposing that a man is tried and convicted of drunkenness and sentenced to a certain punishment, and that when he comes out of prison again he gets drunk again, are you compelled to try him again, or does he begin a new score?—He must be tried again on being drunk twice, if it is within six months.

3683. Then when he comes out again do you try him again for the first offence?—If he is dunrk twice again within the next six months he is tried again.

3684. (*Lt.-Gen. Peel.*) And the fourth time of getting drunk you are obliged to try the man by court-martial?—We are.

3685. What sentence does he receive for the fourth time?—If the matter is referred to the General and the General permits me to deal with it myself, then the man is not tried by courts-martial, and I generally give the man the most severe punishment I can.

3686. What punishment does he receive the fourth time by a regimental court-martial for habitual drunkenness?—He is liable to 42 days imprisonment and 168 days forfeiture of pay.

3687. If when he comes out after that, he gets drunk the fifth time, what then?—That is the first time after having been tried. Then I can give him any punishment I like.

3688. But you can give a much less punishment for the fifth time than he is obliged to receive by the court-martial the fourth time?—Yes, he had his punishment by court-martial for habitual drunkenness and that is all wiped off and then the man starts again.

3689. Although he has been convicted of being an habitual drunkard he is not considered to be an habitual drunkard after he has received the punishment?—No. You may say that he has a fresh start in life after having been tried.

3690. But that fresh start in life does not give him four chances, but only gives him two chances?—It only gives him two chances until the expiration of 168 days.

3691. (*Lt.-Gen. Eyre.*) Some witnesses have objected to the present system of regimental courts-martial on these grounds; that the officers know very well that the colonel will be annoyed if he considers that they have not supported him by convicting a man. In order to remove that from the minds of officers how would commanding officers accept the alternative of waiving the power of confirmation and letting the court-martial go for confirmation to the commanding officer of the district?—I think it would be advisable to do so, if the commanding officer considered that the case was not clearly enough proved by the witnesses, or that there was any irregularity in the proceedings. In fact in one or two cases I have submitted a court-martial to the Assistant Adjutant-General to lay it before the General for his opinion.

3692. The adjutant is now invariably a subaltern, is he not?—Invariably so.

3693. He may be a very young and inexperienced subaltern, may he not?—Yes.

3694. In depôt battalions the adjutants are captains, are they not?—Yes.

3695. With a view to having some judicial assistanee, even on regimental courts-martial, how would you view such an arrangement as this, viz., to have a captain as adjutant, as in the case of depôt battalions, and to require him to qualify himself in the same way as a Deputy Judge Advocate is required to qualify himself as a branch of the staff for the purpose of assisting at courts-martial and performing those duties as well as the general duties of an adjutant, so that the adjutant should be a better informed man on military points than anyone, he being the man who very often acts for the commanding officer, but being at present from his youth and inexperience of really no use to the commanding officer in court-martial cases?—I think that if he were well up in points of military law it would be of advantage.

3696. If he were made to qualify up to a certain mark in military law, would it be approved of by the commanding officer and considered an assistance to him?—I think so.

3697. (*Chairman.*) You have had experience, of course, on general and district courts-martial?—I have.

3698. Have you any suggestions to offer to the Commission with regard to the constitution of the court in either of those classes?—I think that, as to the number on district courts-martial, it might be reduced to four members, and they might be captains, men who had seen some service, with a field officer for president.

3699. In regard to general courts-martial, would you make any further limit as to members ?—I would.

3700. What limit would you place upon the number on a general court-martial ?—I should say that eight members would be quite sufficient, *i.e.*, according to last Mutiny Act.

3701. (*Capt. Vivian.*) There are nine now, are there not ?—Yes, including the President, the numbers are reduced. I was on a court-martial in Simla two years ago, and we had 12 members there.

3702. (*Chairman.*) Did you find inconvenience to arise from the number of members of the court ?—I cannot say that I found inconvenience; but I think the opinion of eight members is quite as good as the opinion of 12 on a matter of that sort. I think that colonels of regiments ought to be on general courts-martial, because it is only the very worst cases which are brought before them.

3703. (*Capt. Vivian.*) Do you see any reason why the sentences of military courts-martial should not be promulgated at once, as is the custom in naval courts-martial ?—I think that all sentences ought to be promulgated at once.

3704. (*Lt.-Gen. Peel.*) Do you think that any alteration might be made in the method of taking the opinion of the court instead of beginning at the junior and going upwards ?—I think that in courts-martial it is best for every man to send in his own opinion upon a piece of paper.

3705. (*Chairman.*) Would you apply that, both as to the guilt or innocence, and as to the sentence ?—In the case of the sentence if it was an intricate case perhaps it would require a little talking over. I was speaking merely as to the finding, and not as regards the sentence.

3706. You think that that should be done on consultation amongst the officers ?—Yes, because many points in the evidence have to be considered upon the sentence, and some men might look over small points which they might be required to go into if they gave their sentence at first; and the president afterwards, if he thought it wrong, might point out whether he thought it too lenient or too heavy.

3707. In your experience of district courts-martial is it usual for the president to sum up the evidence before the court come to their finding ?—Not generally. Of course most courts-martial are generally very clear and concise, so that officers can understand it at once; but if it is an intricate case I generally point out the leading points.

3708. (*Capt. Vivian.*) You have said that you think that the officers of the army are not generally sufficiently instructed in military law. It has been suggested by one witness, if not more, who has appeared before this Commission, that it would be advisable to have a legal assessor to attend general and district courts-martial to advise a court as to their proceedings so far as the law is concerned; do you think that would be advisable ?—I do.

3709. Do you think that it would be unpopular in the army ?—Decidedly not.

3710. (*Chairman.*) Have you had any experience in courts of inquiry ?—I cannot say that I have had very much, they are very rarely had recourse to.

3711. Could you speak to the general feeling of officers with regard to courts of inquiry ?—If a commanding officer wishes to have a matter inquired into they are very useful, and they are perfectly harmless, and the commanding officer has the opportunity of finding out the opinion of the senior officers on a point which he might be at a loss perhaps to see through clearly himself.

3712. Have you ever heard any complaints that in consequence of what has taken place at a court of inquiry an officer has lost his commission ?—I had a quartermaster in my own regiment some years ago on whom there was a long court of inquiry, and he was afterwards tried by court-martial, and the evidence which was adduced on the court of inquiry was the cause of his being convicted.

3713. But have you ever known of a case of an officer losing his commission owing to the report of a court of inquiry without being tried by court-martial ?—No, I cannot say that I know of any case of that sort. Nothing of the kind has occurred within my knowledge. I am not speaking of hearsay, but nothing of the kind has occurred at the stations where I have been serving.

Lt.-Col. W. Agg.

21 May 1868.

3714. (*Capt. Vivian.*) Do you see any objection to the questions from the prosecutor or from the prisoner before a court-martial being delivered *vivâ voce* instead of in writing as is the case now ?—I should say they might be put *vivâ voce*.

3715. You think that the proceedings of courts-martial are now generally too lengthy ?—I do.

3716. And that they might be with advantage cut short ?—I do.

3717. (*Lt.-Gen. Eyre.*) Referring to Capt. Vivian's question to you about an assessor at the court-martial, would the commanding officer prefer having a civilian or a qualified military officer to act in that capacity ?—I should say he would prefer a civilian, a man who had been brought up to the law and who perfectly understood it.

3718. (*Lt.-Gen. Scarlett.*) How would you propose that he should be paid ?—He might be paid in the same way as Deputy Judge Advocates in India are paid, I should think.

3719. Are the Deputy Judge Advocates in India civilians ?—No, they are all military men.

3720. Then if you have a legal assessor you take a gentleman of the bar who probably has a good practice ?—So many would not be required. I was considering that it would only be in extreme cases where men would be tried, and consequently there would be fewer cases.

3721. (*Chairman.*) With regard to military punishments, do you think that, now that corporal punishment is done away with, it will be necessary to introduce any other punishment in the army in lieu of it ?—I certainly do.

3722. You think that the discipline of the army cannot be properly kept up unless there is some other punishment in addition to those which are now in existence ?—I think not.

3723. Can you suggest any punishment to take the place of corporal punishment ?—I myself thought that corporal punishment ought to be maintained for what I call the greatest blackguards in a regiment, who fear nothing else but the lash; they do not care for imprisonment, and the lash is the only thing that some of them care for, but I do not know that I could suggest anything in place of it.

3724. What do you think is the existing punishment that the soldier dreads most now that corporal punishment is done away with ?—Penal servitude is considered the next in order of severity.

3725. Do you think that they dread penal servitude more than solitary confinement ?—There are very few stations in England in which solitary confinement is carried out.

3726. But it has been stated to this Commission that there are means throughout this country of enforcing solitary confinement ?—I think solitary confinement for any lengthened period is the most severe punishment that could be carried out next to corporal punishment. I myself am against lengthened punishments—by that I mean penal servitude; but if a man got solitary confinement for a long period I think he would feel that as much as anything.

3727. Do you think that the alteration of the diet of the soldier is at all dreaded by him, such as giving him bread and water, for instance ?—They could not get that much longer than they do in prisons now. They can get bread and water for a week at present, and it is looked upon as a severe punishment. I think the general dieting of prisoners might be revised, with a view to making imprisonment more dreaded.

3728. Do you think that the punishment of shot drill may be carried farther than it is now ?—Yes, if it is properly carried out, but I do not think that drill

Lt.-Col. W. Agg.

21 May 1868.

is carried out properly in the prisons which I have been into.

3729. What alteration would you suggest?—That the rules as to picking up and laying down the shot should be strictly carried out. I have seen men instead of carrying it at full length of the arm, bring it up into their arms, and that is very easy work, comparatively speaking.

3730. What is the regulation with regard to the mode of carrying the shot?—They are not allowed to bend the knees in putting it down and picking it up, and I do not think that is sufficiently attended to.

3731. Is there anything in the prison discipline which you could suggest as to making the punishment more severe than it is at present, with a view of taking the place of corporal punishment?—I think if the men were to be kept more apart and in solitary confinement that would make it more severe undoubtedly.

3732. At the present moment those who are undergoing penal servitude have means of communication nearly all day long, have they not?—Upon that I cannot give a clear answer. I am not well acquainted with the rules of penal servitude prisons. I have not seen any since I have been home, I am only speaking about military prisons that I see.

3733. Could you suggest any other out-door work to be imposed upon a prisoner, which might be made valuable for the public service, and which would still be of a penal nature, such as building operations?—That is not hard work, that is more an amusement; I think I should prefer road making, or anything of that sort, but building the men would look upon more as an amusement than a hardship. I would not allow men outside the prison wall.

3734. I collect from your evidence that you think the only alteration that you could suggest in the punishments is, that of applying the present punishments rather more severely?—Yes.

3735. You have no new punishment to suggest?—I have no new punishment to suggest, only carrying out the prison rules more stringently.

3736. It has been suggested here by several witnesses that an alteration might safely be made in the mode of punishing non-commissioned officers, would you agree in that view?—I think so. A commanding officer has no alternative between having a non-commissioned officer reduced and letting him off.

3737. In the case of a serjeant, for instance, would you suggest that he should be punished as a serjeant, or that it should be necessary to reduce him to the next rank before punishing him?—I should say reduce him to the next rank.

3738. To that of corporal?—To that of corporal; and give the commanding officer the power of reducing corporals.

3739. Do you think there is any punishment which could be inflicted on a serjeant without reducing him at all?—I do not think it a good plan to punish serjeants, because the men, of course, hear these things, and they would look upon the serjeant as not being so good as he should be; and perhaps they might slight and insult him in some way or other.

3740. (*Capt. Vivian.*) If a serjeant were kept under arrest for so many days, for instance as you put an officer sometimes under arrest now, would you object to that?—That might be done; but at the same time it is a kind of thing which non-commissioned officers, I think, would not care so much about.

3741. (*Chairman.*) Has it occurred to you in your regiment to have to reduce a serjeant to the ranks, and afterwards to restore him to his rank of serjeant?—After a length of service. There are men that I have reduced and made serjeants again.

3742. Have you found that those men have lost any of their authority with the private soldiers?—No; in fact I think they make the best non-commissioned officers. They have seen their mistakes, and I think they do their duty quite as strictly, if not more so, than others. Of course they are men whom I would not allow to be promoted unless they have proved themselves to be deserving of reinstatement.

3743. (*Lieut.-Gen. Scarlett.*) Do you think that if you were to reduce a serjeant to be a corporal he would be as efficient as if he had not been reduced; that is to say that he would command the same respect from the men?—Possibly not; but at the same time it is the only way of dealing with them that suggests itself to me. But a corporal's duties are so very different from a serjeant's that I think he might do the duties without being looked down upon by the privates.

3744. (*Lieut.Gen. Eyre.*) Could you in some instances apply fines to the cases of serjeants, as is done in some continental armies?—Yes; but I should make them much heavier in proportion to the private.

3745. And with a power to appeal?—Yes.

3746. You would approve of that?—Yes, I would; I think it might be done.

3747. (*Capt. Vivian.*) How long has your regiment been in England?—13 months.

3748. Have you had many cases of flogging in those 13 months?—There was one case at Dover, I think, when I was away upon long leave.

3749. Now that flogging is abolished as a punishment, do you think there will be any greater difficulty in maintaining discipline in a regiment than there was before?—I think some men will not now hesitate to commit crimes for which, if flogging had been in force, the fear of the lash would have prevented them.

3750. Do you think it would be a good thing now to increase the power of the commanding officer in getting rid of bad characters?—I do.

3751. You know that in the regiments of household cavalry the commanding officers have the power of turning such men out of the regiment?—Yes.

3752. Do you think that, now that flogging is done away with, it would be a good thing that the powers of the commanding officer should be extended in that direction?—I do.

3753. If that was the case you do not apprehend any difficulty from flogging being abolished?—I do not.

3754. Have you ever found any men who have been flogged turn out good soldiers afterwards?—Cases of flogging have been very rare, and, as I say, only men of the very worst characters have been flogged.

3755. Do you not think that flogging was a demoralizing punishment and that it made the man so completely lose all self-respect that he really never did turn out well afterwards, and that it would have been better for the service to have got rid of him?—It would have been better for the service to have got rid of him. If commanding officers can get rid of such men that is sufficient.

3756. (*Lt.-Gen. Eyre.*) With reference to the questions which you are now answering how many men would you say you have in your regiment whose characters are so bad and whose conduct is so troublesome that you would like to get rid of them?—About half a dozen, I should think now.

3757. (*Lt.-Gen. Scarlett.*) Would you wish to get rid of those men unless they had been marked in some way, so as to prevent their re-enlisting?—No; as they might re-enlist.

3758. (*Lt.-Gen. Eyre.*) Are the offences of those bad men likely to be mostly of a civil or of a military character?—They are the kind of men that would be guilty of any crime whatever. Their crimes are principally military crimes, but they might be guilty of theft, for instance.

3759. You cannot say whether the crimes of those men that you would like to get rid of, are crimes of a moral character or of a military character?—They are principally of a military character.

3760. (*Capt. Vivian.*) Every fellow of that stamp is known perfectly well in a regiment by the officers and men as a bad character, is he not?—Yes, I have luckily had an opportunity lately, my regiment being over the strength, of getting rid of those men and

saying I would not take them on, but I have about six men now, I think, that cause more crime in the regiment than all the rest put together.

3761. (*Chairman.*) Is there any class of crimes which you would prefer to submit to a civil tribunal instead of a military tribunal?—I think all military tribunals ought to be so constituted as to be able to deal with all crimes.

3762. Have you found considerable difficulty in dealing with cases of embezzlement before courts-martial?—They are very intricate cases. I was on a general court-martial upon an officer in an embezzlement case, and it was a very tiresome case to deal with.

3763. Do you not think that that case might have been dealt with?—I do, in that case, but that is the only one which I can at present think of.

3764. (*Mr. Mowbray.*) Did you not, in the case to which you allude, find it utterly impossible to arrive at any conclusion as to the accounts?—We arrived at a conclusion about some of it, but we could not find the prisoner guilty of the whole of it. It was very difficult to bring it home to him.

Lt.-Col. W. Agg.

21 May 1868.

3765. (*Lt.-Gen. Eyre.*) What objection would there be on the part of commanding officers to hand over to the civil power all cases of a moral nature requiring trial, confining courts-martial to purely military offences; those moral crimes including large thefts deserving anything more than summary dealing, and all disgraceful acts of a certain kind?—I think I should deal with a soldier by court-martial for crimes of that description.

3766. For all crimes?—I think so. In embezzlement it is very difficult sometimes to get to the truth of the matter, but I think I should deal with all military men by courts-martial, if it is necessary to have them brought before any court.

3767. What would be your objection to having them tried by the civil power?—I should have no objection to it, but I do not see why the civil power should have to try the crimes of soldiers. I think if a man is a soldier he ought to be tried by a military court.

3768. Whether for a military offence or for a moral offence?—Yes.

The witness withdrew.

LIEUT.-COLONEL JAMES SINCLAIR THOMSON called in and examined.

Lt.-Col. J. S. Thomson.

3769. (*Chairman.*) You command the 54th regiment, do you not?—I do.

3770. How long have you been in command of that regiment?—Two years.

3771. How long have you been in the regiment?—25 years; I am in the 26th year. I have never been in any other regiment.

3772. Will you tell the Commission what is the practice in your regiment with regard to the instruction of officers in their duties as members of courts-martial?—In former days an officer could not sit on a court-martial under six months. The subalterns are weekly examined by the adjutant, and the captains by either field officers or the colonel. No officer under three years' service is allowed to sit in general court-martial. Qualification to sit on district court-martial is six months' attendance at proceedings of all courts-martial and competent knowledge. That I have carried out hitherto.

3773. Do you think that any further means should be taken to instruct young officers in military law?—I do not quite see the object of their being so well instructed in military law. I think that all the cases now tried by courts-martial are very simple, generally speaking, and the facts laid down in the Queen's Regulations are very plain.

3774. But at the same time is it not the case that there are various instances of the sentences and findings of courts-martial being revised?—I think that is very seldom the case in a regimental or district court-martial.

3775. You think that it is oftener the case on general courts-martial?—I have never been on a general court-martial in my life.

3776. What is the nature of the examination in military law through which your officers go?—I believe there is no special examination for them in military law before they get their commission, but I do not know what that examination is. Before ensigns are promoted to the rank of lieutenants they are examined on the customs and powers of courts-martial, and again, before they become captains.

3777. Does a subaltern of your regiment, in passing from ensign up to captain, come under your own supervision in that respect as to his knowledge?—Either I or the major examine the captains once a week; but that examination is principally upon drill, and not so much upon military law.

3778. How often is an officer examined on military law?—It is not the practice in my regiment to examine them on military law especially.

3779. You heard the evidence given by the last witness; do you, generally speaking, concur in the observations which he made?—Generally, I do. I think that it would be a very good thing to do away with regimental courts-martial, giving more power to commanding officers.

3780. Would you abolish regimental courts-martial altogether?—I think if the commanding officers had more power it would be better.

3781. If you gave the commanding officer more power, would you abolish regimental courts-martial?—I would.

3782. Under such circumstances would you give the soldier, in all cases, the right of appeal to a court-martial?—I would give the soldier the right of appeal, with this proviso, that if the appeal was found vexatious the man should be punished for making the appeal; otherwise, I think it would cause an immense amount of trouble.

3783. (*Lt.-Gen. Scarlett.*) Is not a regimental court-martial rather a protection to a man against any ebullition of temper or disposition to severity on the part of the commanding officer?—Yes; I suppose, looking at it in that way, it is a protection to the men. I think that, as a rule, men would rather have their cases settled by the commanding officer than be tried by court-martial.

3784. (*Lt.-Gen. Peel.*) But you say that if a man appealed, and on the appeal was found guilty, you would give him a heavier punishment than he would have had in the first instance?—I think there must be some check to the power of appeal in all cases.

3785. (*Capt. Vivian.*) Then the appeal would be only to a district court-martial, would it not?—Then I should give him the punishment that could be awarded by a district court-martial, which would be in excess of that awarded by a sentence of the commanding officer.

3786. That would be for the court to decide, would it not?—Yes.

3787. (*Lt.-Gen. Peel.*) I understand that you would give a man a heavier punishment if he appealed from a commanding officer to a district court-martial than the commanding officer would have given him if he found him guilty?—If he says that he is not guilty of the crime I would allow the appeal to go on, but I would not allow any appeal upon the sentence.

3788. For instance, in the case of a charge of drunkenness, if the man said he was not drunk, would you allow him to appeal?—Then I should allow him to appeal, but I would have him tried by a garrison court-martial on framed charges, and then he would be much worse off than if he were settled by his commanding officer.

3789. (*Lt.-Gen. Scarlett.*) You think that that would be necessary as a check upon the right of

Lt.-Col. J. S. Thomson.

21 May 1868.

appeal?—I do. If the man appeals he will appeal upon a charge framed by the commanding officer against him.

3790. (*Capt. Vivian.*) Do you agree with the last witness, that if the power of the commanding officers were extended to the limit which he proposed, all cases in which a commanding officer should think it advisable to punish a soldier by imprisonment should be recorded in the orderly room in writing, the evidence being taken before the commanding officer for the prosecution, as well as for the defence of the prisoner, upon oath?—I do not.

3791. At present there is no record taken of summary punishment in the orderly-room, is there?—There is no record of the evidence.

3792. And you would object still, supposing that the power of the commanding officer was extended in order that regimental courts-martial should be done away with, to the commanding officers being obliged to keep a record in writing of the proceedings, and of the evidence upon which they have sentenced the prisoner?—That is making it a court-martial, as it were. Do you propose that the same amount of evidence as is now adduced on courts-martial should be taken by the commanding officer and kept in a book?

3793. It has been suggested that, in order that regimental courts-martial, which are now composed, as is supposed, of officers who are inexperienced, should be done away with, the commanding officer should have his power of punishment extended; that a prisoner should be brought up before him in the orderly room, that the adjutant, the captain of his company, and the non-commissioned officers of his company should be present; that then the commanding officer should take evidence in support of the charge against the prisoner upon oath; that the prisoner also should give his defence, supporting it by witnesses also upon oath; and that then the commanding officer should, as a magistrate does upon the bench, dispense whatever justice he thought the case required. As commanding officer of a regiment, would you prefer that system to the present system of referring to a regimental court-martial a case which was of so grave a character that you had not the power of dealing with it alone?—Yes, very much.

3794. That is to say, that you would prefer the commanding officer being invested with a somewhat similar power to that which a civil magistrate now possesses?—Yes. In that case I should condense the evidence, and have each witness sign it in a book.

3795. (*Lt.-Gen. Eyre.*) Am I not right in considering that all that Captain Vivian suggests as a *modus operandi* is carried out, with the exception of recording the evidence upon oath, and that all the parties he names are present?—Always.

3796. (*Lt.-Gen. Scarlett*). You record the names of the witnesses in the defaulters' book, do you not, although you do not record the evidence?—Yes, they are always in the defaulters' book.

3797. (*Lt.-Gen. Peel.*) A regimental court-martial is always assembled for the purpose of administering a heavier punishment than the commanding officer can give, is it not?—Certainly.

3798. As a matter of fact, there is very seldom any doubt about that, is there?—Not the least. It is of no use bringing a man before a court-martial for a smaller punishment than a commanding officer can give him.

3799. And therefore, if the power of the commanding officer were extended, would there not be less occasion for courts-martial?—Certainly.

3800. (*Chairman.*) Do you agree with the last witness with reference to doing away with the present system of compulsory courts-martial upon the fourth offence of drunkenness, and giving greater power to commanding officers of substituting stoppage of pay for the present punishment for drunkenness?—I do. I think that imprisonment to any extent for drunkenness is a mistake. It is making good men do a bad man's work. I should prefer to try a system of fines. It has the further disadvatage of inciting men to remain absent all night, when drunkenness brings the liability to punishment so much more severe than absence without leave.

3801. But you would couple the system of fines, I presume, with some other punishment?—Certainly, but not to a great extent.

3802. You would merely couple the system of fining with some other punishment, the fine being the principal element of the sentence?—Yes, increasing it in case of the repetition of the offence.

3803. (*Lt.-Gen. Scarlett.*) Do you think that imprisonment deters a man from drunkenness, or reclaims him from drunkenness?—Very rarely; I think, as a rule, men do not go out meaning to get drunk, but they go down in the town and meet acquaintances and get drunk.

3804. (*Lt.-Gen. Peel.*) It depends upon the amount of money they have in their pockets, does it not?—Quite so.

3805. (*Capt. Vivian.*) But does not a man who has been imprisoned for drunkenness come out with a lot of arrears of pay, very likely?—No; his pay is stopped. The Government only allow 6*d.* a day for his subsistence, which goes to the gaol. He gets no back pay.

3806. (*Chairman.*) With regard to the punishment of non-commissioned officers, do you agree with the last witness that it is desirable to institute some punishment for non-commissioned officers, without being necessarily obliged to reduce them to the ranks?—I have a system of reducing a corporal a certain number of steps in the roll, and I see no objection to reduce a serjeant to rank of corporal,

3807. Evidence has been given before this Commission to the effect that a reduction on the roll of serjeants would not be a punishment, do you agree in that?—It is no punishment.

3808. Inasmuch as a serjeant is generally promoted without regard to his standing in the regiment?—Yes; I think that the only punishment that is at all applicable to a serjeant would be fines, and reduction to lower rank of corporal.

3809. You think that no double duties in a regiment could be assigned to him without diminishing the respect paid to him by the private soldier?—I would not adopt that, except for irregularities on those duties.

3810. Do you inflict that punishment now?—Yes.

3811. Do you not think that it would be possible to carry that punishment still farther?—It would be quite possible.

3812. Would it be advisable?—I would not punish a serjeant.

3813. For instance, might not the command of picquets be made available as a punishment which would be felt as a severe punishment by non-commissioned officers, without diminishing the respect paid to them by the soldiers?—As a rule, the serjeants are very seldom put under arrest, except sometimes for neglect of duty. For any irregularity on guard or picquet, they get an extra guard or picquet; and for any neglect of duty as orderly, I should give them an extra orderly duty, or three orderly duties.

3814. Would you think it advisable to carry that system any farther than it is carried now?—I would not.

3815. Is it the system in your regiment, or in the army generally, to promote corporals to serjeants according to their standing?—I promote them by seniority, unless there is something against it.

3816. Then do you think that as regards corporals it would be considered a punishment to reduce them in their own ranks?—I am sure it would; it stops them in my regiment from getting promotion so quickly as they would otherwise have it.

3817. You do reduce the corporals then in their own rank in your regiment?—I do.

3818. (*Lt.-Gen. Scarlett.*) That is to say, you do not select them where you otherwise would have selected them?—I do not select them, as I should

otherwise have selected them from the top of the list.

3819. (*Chairman.*) Do you keep a list in your regiment of the serjeants and corporals according to their standing?—Yes.

3820. As a punishment you put down a corporal several steps?—Yes, or to the bottom of the roll.

3821. But as regards serjeants you think that that punishment would not be applicable?—It would be no punishment. The only promotion a serjeant gets is colour-serjeant, and you take them by selection.

3822. Are you in the habit of reducing a colour-serjeant?—You may take away his colours; it very rarely happens, but I have done so.

3823. Would it be considered a punishment to take away from a serjeant the post of musketry instructor?—Yes.

3824. Is it ever done as a punishment, and not because of unfitness?—It has not been done in my regiment.

3825. Do you think that a serjeant is ever taken from the post of musketry instructor, and as a punishment reduced to a simple serjeant?—I do not know; but I should think not, unless he is incompetent for his duties as a serjeant instructor of musketry. If he is not fit for a musketry instructor he is not fit for a serjeant. It is not reduction, I consider, to remove a man from being a musketry instructor to be a serjeant.

3826. But would it be regarded as a punishment to a musketry instructor to be deprived of that office and to be made a simple serjeant?—Yes, I think they like the post of musketry instructor; but very few men are qualified for it.

3827. (*Lt.-Gen. Eyre.*) The punishment in that case is the fact that he loses a shilling a day, is it not?—That is the fact.

3828. (*Lt.-Gen. Scarlett.*) But should a musketry instructor commit any crime, such as absence without leave, or drunkenness, would you consider it a proper punishment to reduce him to a serjeant?—I would not.

3829. What course would you take?—I would try him the same as any other serjeant.

3830. (*Chairman.*) Do you think that any new punishment could be introduced for non-commissioned officers?—I think that a system of fines would be a good thing to adopt, and reduction to lower rank.

3831. (*Lt.-Gen. Eyre.*) You would give the man the power of appealing, would you not, as it affects his pay?—That power I should give to a court-martial. If he was not satisfied with the award of his commanding officer he should appeal to a court-martial upon charges sent in by his commanding officer, and he should be sentenced accordingly.

3832. (*Lt.-Gen. Scarlett.*) And you would consider that a man who had so appealed would probably meet with a heavier sentence than his commanding officer would have given him?—I think so.

3833. (*Lt.-Gen. Eyre.*) A commanding officer would, of course, take very good care to be safe in that respect?—I think so.

3834. (*Chairman.*) Will you state to the Commission your view with regard to the Regulations under which a non-commissioned officer is now punished; does a serjeant, or does he not, lose any distinction which he has gained as a serjeant, except his medals, when he is once convicted by a court-martial?—He does not necessarily lose his medals by conviction of court-martial. He would lose his chance of a good conduct medal and one good-conduct badge.

3835. What else does he lose?—I do not know that he loses much else, except that his service as a serjeant does not count for his pension.

3836. (*Lt.-Gen. Eyre.*) If he is reinstated would not his previous service as a serjeant reckon towards the pension of a serjeant?—I think not. It is laid down in the Warrants, and I would rather refer you to the Warrants as to that.

3837. (*Lt.-Gen. Peel.*) Do you not think that in the case of a man having been reduced, if he is a good-enough man to be reinstated, the commanding officer should have the power of doing away with the disadvantages which now exist, consequent upon his having been tried by a court-martial?—I should put a limit to that, say, if he was a serjeant for 10 year afterwards. He must show that he was steady.

3838. The commanding officer is the best judge of that, is he not?—I would make him hold his position for a certain time before I reinstated him in all his advantages.

3839. (*Capt. Vivian.*) But would you not give the commanding officer power to restore him when he likes?—Not when he likes, but with a limit that a serjeant must be a certain number of years a serjeant after the second time before the commanding officer could have the power, so to speak, to quash his former court-martial.

3840. (*Lt.-Gen. Scarlett.*) In point of fact would you partially rescind the rule which now exists, that a non-commissioned officer shall not be eligible for a good conduct medal, or gratuity, if he has not been 18 years clear?—I would modify it, certainly. I think that, if a serjeant has been 10 years in the rank of serjeant, he ought to have the good conduct medal and the gratuity.

3841. (*Chairman.*) You heard the evidence of Colonel Agg upon the substitution of some punishment for corporal punishment which has now been abolished, could you suggest any punishment in substitution for corporal punishment?—I have thought of it, and I cannot suggest any substitute.

3842. What do you think is the punishment which now exists which can be administered with the greatest speed, and with the greatest effect?—The moment a man is brought up before you his punishment commences.

3843. Supposing a man was guilty of insubordination, what punishment, which now exists, do you think is the most efficacious for preserving discipline?—I think that the soldier dreads solitary confinement most; but it is a punishment I am not very fond of myself. I am certain they dread solitary confinement more than anything else.

3844. (*Lt.-Gen. Eyre.*) Articles 782 and 783 of the Queen's Regulations are as follows:—"A soldier, "who has forfeited his claim to the advantages "towards good-conduct pay and pension derivable "from his former service, is to be recommended for "restoration to these benefits as soon as he shall "have established his claim thereto by an undeviating course of good conduct for five years in case "of a first conviction, for seven years in case of a "second conviction, or for ten years should any "circumstance of an aggravating character have "attended the commission of the offence on account "of which he had incurred the penalties in question. "He may, however, be recommended for such restoration within half the periods here prescribed, "provided that he has not only shown unremitting "good conduct, but has also given good, faithful, or "gallant service of a constant and sustained character "in the field, or has performed some specific act of "valour in the field, reflecting honour on the regiment and on himself. The period of probation is "in all cases to be reckoned from the release of the "soldier from imprisonment and his return to duty." Do you see any reason why some such regulation should not be applied also to serjeants with reference to their medal and gratuity?—I think they do. I see no reason why they should not apply, but I should make them serve a certain number of years as serjeants, uninterruptedly, before they were recommended for the gratuity.

3845. That would hold out some hope to them at all events, would it not?—Yes, I think the serjeant ought to get the same advantages as the soldier, with that limit or proviso.

3846. (*Lt.-Gen. Peel.*) First you would restore him as a serjeant, and then after five years of good conduct you would have the power of placing him in exactly

Lt.-Col. J. S. Thomson.

21 May 1868.

the same position as if he had never been tried before?—Yes, exactly.

3847. (*Chairman.*) You heard the evidence given by Colonel Agg with regard to putting the questions down in writing, do you agree that it would be better to put them *vivâ voce*?—I think it is a bad principle to make the junior ensign vote first.

3848. How would you suggest that they should give their votes?—I think in writing is a very good plan.

3849. (*Lt.-Gen. Scarlett.*) But would you have the questions put in writing on a general court-martial on an officer, as they are at present?—I never was on a court-martial on an officer, but I think if a court-martial is to be submitted for confirmation it must be in writing.

3850. (*Mr. Mowbray.*) But do you think it necessary that the question itself should be put down in writing and handed to the court before it is put to the witness?—No.

3851. (*Mr. Headlam.*) Of course it would be more convenient, would it not, if there was a short-hand writer to take down the questions?—I never was on a general court-martial; I can answer about district courts-martial; the evidence there is all taken down in writing in question and answer, but I would not do away with the proceedings as we call them now. I think they are very clear at present.

3852. (*Capt. Vivian.*) If instead of the president of the court-martial, as at present, having all the inconvenience of writing down every question and every answer it was done by a short-hand writer, do you think there would be any objection to that?—There would be no objection, but I think there is not much trouble in the way it is done now, and I think it would be better to do it as it is done now. I am speaking only of district courts-martial. I think the proceedings are not so long as to require their being shortened.

3853. At present the president of a court-martial writes down all the proceedings, does he not?—Not necessarily; one of the members of the court may do it.

3854. But in order to shorten the proceedings should you see any objection to all that being done by a short-hand writer?—I see no objection to it, but who would have to copy the proceedings out again in a fair hand for the confirming officer?

3855. (*Chairman.*) Have you any suggestions to offer with regard to punishments?—I think the greatest boon would be to give the commanding officers power to dismiss bad characters.

3856. You do not believe that that would lead to the commission of crime for the purpose of getting dismissed?—No.

3857. (*Lt.-Gen. Eyre.*) When they are discharged for bad conduct do you deport them to their parishes?—Yes.

3858. (*Lt.-Gen. Scarlett.*) If they are discharged for bad conduct at present they must be marked, must they not?—They must be marked with the letters "B. C;" but a very simple means of overcoming the difficulty would be to have every one, officers and men, marked with a crown or something of that kind, on entering Her Majesty's service; there could be no objection to this, and it would be a great check to desertion and security against fraudulent enlistment, as every man offering himself for enlistment with the mark upon him would be obliged satisfactorily to account for his former service.

3859. Would you discharge them without being marked?—I should like to do it myself; but I do not think it would be a good thing to do.

3860. Would you like other colonels to do it?—No; I am certain it would be a very good thing if it could be done in some way.

3861. (*Lt.-Gen. Eyre.*) Now that corporal punishment is abolished, and as public opinion dwells very much upon the means of improving the *morale* of the service, and making it more sought after by the better classes, can you suggest any means by which that result in any degree may be arrived at?—I cannot.

3862. With the object of reducing crime in the army, and of preventing the necessity for punishment, do you think that any system of rewards, indulgences, and privileges might be introduced for the comfort and benefit of the good and well drilled men, not putting the country to any expense, but merely exempting such men as much as possible from such parades and roll-calls as might be found practicable, giving them complete freedom of action to go where they please, provided they neglect no duty and disobey no order; giving them leave to be absent till a late hour at night, and giving them furloughs on an increased scale; selecting them, when permitted by the Government, to go harvesting; giving them the means and the time to follow their trades, if they have any; letting them be paid weekly if they prefer it to being paid daily, and in fact considering their ease, comfort, and advantage in every possible way; and would not such a system as this eventually tell upon the whole of the men in the regiment, and upon their friends out of the regiment?—I think some of those suggestions are good, but there are some that I should not like. I do not think you would get better recruits by those means.

3863. (*Lt.-Gen. Peel.*) What is the largest amount of stoppages that a commanding officer has now the power of inflicting?—Five days for absence.

3864. Has it increased in proportion to the increased pay that a soldier now receives?—Yes. The increase of pay causes a corresponding increase of pay stopped.

3865. With regard to the men being paid weekly or daily, that is a point upon which a question to which it appears great importance was attached was put in the House of Commons the other day. Would the men prefer being paid daily or weekly?—I suppose they would prefer being paid weekly.

3866. Do you think it would be advantageous to give well-conducted men the power of receiving their pay weekly instead of daily?—That should be done with great caution, I should think. As a rule I should prefer their being paid daily.

3867. (*Capt. Vivian.*) But, as a sort of reward to good conduct men, do you think it would be well to create the distinction of paying them weekly instead of daily?—It would be; married men are paid weekly now.

3868. Would you give any commanding officer the power to say to a well-conducted man, "You shall be put on the weekly pay list"?—I am sure they would like it.

3869. (*Lt.-Gen. Peel.*) Do you think it would be advantageous if commanding officers had the power of granting that privilege?—I do.

3870. (*Lt.-Gen. Scarlett.*) Married men can have their pay weekly now, can they not?—They can.

3871. (*Chairman.*) You heard what the last witness said with reference to the crime of embezzlement, do you agree with him that it would be advisable to submit those cases more to the civil tribunals than is the practice at present?—I do, certainly.

3872. Would you make it a rule in all cases?—As to embezzlement, or theft, I would. It is now the rule with regard to the thefts as much as I can make it so.

3873. (*Lt.-Gen. Peel.*) But you have the power, have you not, of handing a man over to the civil power?—Yes, I have, and it is a very good thing.

3847. (*Lt.-Gen. Eyre.*) Would you apply that to disgraceful cases?—No, I should try them by court-martial.

The witness withdrew.

Colonel Samuel Netterville Lowder, C.B., a member of the Commission, examined.

Col. S. N. Lowder, C.B.

21 May 1868.

3875. (*Chairman.*) Will you state what post you hold?—I am Deputy Adjutant-General and senior colonel in the Royal Marines.

3876. How long have you served in that corps?—Nearly 35 years.

3877. How long have you held the rank of commanding officer?—I have held the rank of colonel since the year 1864. Part of that time I was commandant of a division.

3878. The marine force is subject partly to military law and partly to naval law, is it not?—Yes, according to circumstances.

3879. When is that force subject to military law?—When they are serving on shore in the United Kingdom as a general rule. There is an exception when they are serving on shore in foreign countries formed into battalions or brigades, as they are sometimes.

3880. Serving in a battalion on foreign service they are subject to the Marine Mutiny Act?—To the Marine Mutiny Act, which I call military law.

3881. How does the Marine Mutiny Act differ from the Military Mutiny Act?—It is assimilated to the Army Mutiny Act in every possible way. Of course there is a good deal in the Army Mutiny Act which can have no reference to marines; but as regards the punishment of offences and military economy generally, recruiting, and so forth, it is very nearly assimilated in all its provisions to the Army Mutiny Act, and from year to year we adopt any alterations which are made in the Army Mutiny Act, and which have any bearing upon or which are likely to have any relations with our force.

3882. Do you have courts-martial of the same description, general, district, and regimental?—Exactly the same, excepting that we call a regimental court-martial a divisional court-martial.

3883. (*Capt. Vivian.*) Detachments of marines serving on board ship are subject to naval discipline, are they not?—Yes.

3884. But if those detachments of marines are landed to unite with a military force on any expedition they are instantly under military law, are they not?—They require an order from the senior naval officer under whom they are serving; that is specified in the Marine Mutiny Act.

3885. Supposing the Mediterranean squadron, having on board each vessel a detachment of marines, desired to unite for the purpose of a second descent on Egypt with a military force, directly those detachments of marines left their ships and became joined to the military force they would come under the Army Mutiny Act, would they not?—No, the officer commanding would not be authorized to carry out military law without an order in writing from the senior naval officer whose command he had just left.

3886. (*Chairman.*) Are the forms of procedure nearly the same in naval courts-martial as in military courts-martial?—As nearly as possible.

3887. In what do they differ?—In no particular.

3888. Are the convening authorities the same?—The Board of Admiralty alone has the power of convening a general court-martial, or they may delegate the power to an officer of a certain rank.

3889. How are the courts composed?—Exactly the same as in the army. We have made the same alterations in the Marine Mutiny Act as were made in the Army Mutiny Act last year.

3890. Are the punishments which they have power to award the same?—As nearly as possible; I do not know of any difference.

3891. On what authority is a district or general court-martial summoned in the marines?—The order for the trial of a marine by district court-martial, as a matter of course, proceeds from the officer in command of the district. Of course he is generally an army officer, but circumstances might happen under which he would be an officer of marines; and that is provided for in the Mutiny Act.

3892. Is the court exclusively composed, when subject to the Marine Mutiny Act, of marine officers, or may military officers form part of it?—It is composed of officers of the army and marines. It is provided for in the Mutiny Acts of both the army and the marines and at, I think, Article 146 of the Articles of War. There is a peculiar arrangement when a general court-martial takes place, particularly if it is on an officer. It is often considered desirable to have a mixed court, and the commandant of the division applies, through the Deputy Adjutant-General, to the Admiralty, and they apply to the Commander-in-Chief to order a certain number of officers to sit as members of that court.

3893. By whom is the warrant issued?—The warrant must be signed by two Lords of the Admiralty.

3894. How is the president appointed?—The president is selected by the Deputy Adjutant-General, and he is appointed under the authority of that warrant.

3895. Does the Deputy Adjutant-General assist at the court-martial?—Not in any way, except that the documents pass through his hands. They are addressed to him, and he addresses himself directly to the commandants of divisions.

3896. Who is the prosecutor on those occasions?—An officer is usually appointed for the purpose.

3897. By whom?—By the commandant of the division.

3898. Whether marine or military, according to circumstances?—The commandant of the marine division in the first place represents the case to the Deputy Adjutant-General, at the same time submitting the charges on which he proposes the prisoner should be tried. The Deputy Adjutant-General submits these charges for the approval of the Admiralty, and requests that a warrant may be issued to convene a court-martial, and when he gets this authority he instructs the commandant to take the usual measures for assembling the court, one of which is the selecting an officer to act as prosecutor who may be best able to manage the case.

3899. In cases of capital punishment, who is the confirming authority?—The Crown, the same as in the army, and also in cases of cashiering.

3900. Have you in the marines any courts of inquiry?—Yes, we use them rather frequently.

3901. Have you found that they cause any dissatisfaction amongst the officers?—Not that I have ever heard of.

3902. What powers do your courts of inquiry exercise?—The instructions to a court of inquiry usually are not to give an opinion, but to take evidence as an assistance to the commanding officer in coming to a conclusion.

3903. To whom do they report?—To the commandant of the division who order the court to assemble.

3904. In the marines is an officer ever subject to the loss of his commission or to other punishment in consequence of the report of a court of inquiry?—I have never heard of such a case.

3905. From your experience in the marines, should you say that the courts of inquiry had not caused any dissatisfaction amongst the officers?—On the contrary, I think they are viewed with satisfaction. We use them more for cases of embezzlement and things of that kind, and I think more with regard to non-commissioned officers and men than with regard to officers; but I know several cases where courts of inquiry have been held on the conduct of officers previous to courts-martial. In fact, I have ordered them myself before now.

3906. Supposing that an officer finds himself aggrieved by the report of a court of inquiry, is it usual to grant him a court-martial if he wishes it?—I never heard of a case of that kind.

3907. You never heard of a court-martial being refused in such a case?—No; as a rule a court-martial generally follows a court of inquiry, I think.

Col. S. N. Lowder, C.B.

21 May 1868.

3908. I think you said that a court of inquiry does not pronounce any opinion?—No, unless it is ordered to do so.

3909. But when it has been ordered to report its opinion, and the court-martial has followed, could you state whether the opinion of the court of inquiry has been generally confirmed or the reverse?—I should say that it has been generally confirmed.

3910. I understand you to say that you think that a court of inquiry is a very useful tribunal?—I think it is a very useful thing as preliminary to a court-martial. It enables a commanding officer to form a much better conclusion, particularly if it is a difficult or an intricate case, and besides it saves him a great deal of trouble in going into the matter.

3911. When you have to refer a case to the Judge Advocate for a legal opinion, how is the distinction made as to the authority as to which the court shall submit, if the court is composed equally of military and marine officers?—The proceedings of all general courts-martial assembled under the authority of the Admiralty are referred to the Admiralty for examination and confirmation.

3912. You have heard the evidence given with regard to military courts-martial; have you been led by what you have heard to suppose that the tribunal in the marines is a better tribunal in any respect than the military tribunal?—I see no difference in them. The authorities are rather different, but the authority is exercised in the same way.

3913. (*Lt.-Gen. Scarlett.*) The only difference is that general courts-martial are referred to the Admiralty instead of being referred to the Queen?—They are referred to the Queen if the involve capital punishment or cashiering. There is a peculiarity about district courts-martial. When a marine is tried by a district court-martial the proceedings are confirmed by the General commanding the district, and they are then sent to the Secretary of the Admiralty, who sends them to my office. In the event of there being anything like an irregularity, it raises rather a difficulty; because those proceedings having been already confirmed by the general of the district, I have no authority to refer them back to any one for revision. I know a case now where there was an irregularity, but it was not referred, because I had no authority to do it, and the sentence is at present being carried out. It is nothing of any great importance. Therefore, I think, that if those proceedings, instead of being referred to the Admiralty, were sent to the Judge Advocate-General, like all the rest, it would be much better.

3914. (*Chairman.*) Is there any reason why marines on board ship while serving in England should not be subject to military courts-martial, as other branches of the army are?—I think the difference with them would be trifling, so far as the crimes and punishments went. It would involve a little difference of adminstration; but I think it would be very distasteful to the naval authorities. In the first place the marines are raised and paid under a special Act of Parliament, and this Act is passed specially for their guidance when serving on shore, which is looked upon rather as being exceptional than as being an ordinary part of their service.

3915. Does the Marine Mutiny Act differ in any material point from the Army Mutiny Act?—No, it follows the Army Mutiny Act as closely as possible for the purpose of crimes and punishments and recruiting.

3916. But you think there is a feeling amongst the marines which would make any change in the tribunal distasteful?—I think that there would be great difficulties attending it.

3917. (*Mr. Mowbray.*) Do you mean that the feeling of the profession would be against it, or that the objection would come from the departments?—From the departments.

3918. (*Chairman.*) Are the summary punishments in the marines the same as those in the army, or as those in the navy?—They are as nearly as possible the same as in the army. Our Articles of War in that part where the powers of commanding officers are defined are exactly the same as those in the army with regard to the amount of imprisonment.

3919. Corporal punishment is still maintained in the navy, is it not?—In the navy, but not in the marines when they serving on shore. It is abolished under the new Mutiny Act.

3920. Is it abolished on board ship?—On board ship the power still remains, but it is very much limited.

3921. What is your opinion with regard to the maintenance of corporal punishment?—I think it is a very great misfortune to the service generally that the power has been taken away altogether.

3922. Can you suggest any other punishment in lieu of it?—The only thing which I could suggest would be solitary confinement, or confinement in dark cells in extreme cases.

3923. You think that is the severest punishment?—I think that it is the severest punishment if it is carried out effectively.

3994. Several witnesses have given it as their opinion that penal servitude is dreaded more by the soldier than solitary confinement; that is not your opinion?—No; I think that for short sentences solitary confinement would be much better; I believe that it is commonly called separation. What I should recommend as constituting solitary confinement would be to make a prisoner do a certain amount of some kind of work in his cell, such as picking oakum, and to do a certain amount in the day, and if he did not do it I would mulct him of his provisions. I have known that done with great effect in civil gaols.

3925. In the marines is the same system followed out with regard to non-commissioned officers as in the army; that is to say, that it is necessary to reduce a serjeant to the ranks?—Yes, there is no other course.

3926. You cannot reduce a serjeant to the rank of corporal?—No.

3927. Should you think it unadvisable to make any change in that respect?—I think so. I should not like to burden the list of corporals with reduced serjeants.

3928. But does it never happen in the marines that a serjeant is reduced and then restored to his rank?—Yes, very often.

3929. Does not that injure the man in the eyes of the common soldiers?—Not as a rule, so far as my experience goes.

3930. Would you allow a non-commissioned officer to be punished without losing his rank?—I think it is rather a difficult question to answer.

3931. But the reason at the present moment, I believe, why it is compulsory to reduce a serjeant to the ranks is, that when a non-commissioned officer has been punished he loses the influence which he had over the men; is not that so?—It is supposed by some to have that effect.

3932. But that is the real groundwork for the present practice, is it not?—The only suitable punishment which strikes me at present would be to place a serjeant or a corporal lower on the roll; but I have heard it stated here in evidence that, as far as serjeants are concerned, that is not considered a a punishment.

3933. In the marines do you take serjeants for promotion according as they stand on the roll?—We take them partly by seniority and partly by merit. We have a great many men who are recommended for distinguished service, and for gallant service, and for particular service, and their claims are taken into consideration as well as those of the seniors, but the basis of the system is understood to be seniority, although a certain regard is had to efficiency.

3934. But merit has its effect, has it not, in the choice which you make?—Yes,

3935. Do you think then that it is considered a punishment by non-commissioned officers to be reduced in their roll?—I think that it is, and I think that it would be if properly carried out.

3936. With regard to corporals in the marines does the same system of promotion prevail, is it entirely by seniority, or by merit, or by both combined?—We allow a certain number of soldiers, who must have served a certain time, and who are anxious for advancement, to qualify themselves for lance-corporals. Character is taken into consideration, in the selection of these candidates, and when they have passed an examination they are placed upon the list and promoted to vacancies at the discretion of the commanding officer.

3937. And you think that the commanding officer generally looks to the position of the men on the roll in the first instance?—I think that he looks to the efficiency of the men a good deal, his object being to get good non-commissioned officers, and the same thing applies to serjeants. Corporals, as a rule, are not promoted to the rank of serjeant until they have passed a qualifying examination.

3938. Can you assign any peculiar reason why a serjeant should not be punished without reducing him, if an adequate punishment can be found?—If a punishment could be found, I think that it would be desirable at all events to try the experiment, but it should be a punishment which would not outwardly degrade him in the eyes of the men and in the eyes of his brother non-commissioned officers.

3939. Could you suggest any punishment which might be inflicted on a non-commissioned officer without degrading him in the eyes of the soldiers?—I am hardly prepared to answer that question now.

3940. Do you think that fines or loss of pay would be effective?—I think that it would be the nearest to it.

3941. Or the imposition of extra duties?—Yes. I would fine him and perhaps deprive him of some privileges or indulgences which the others enjoyed.

3942. If you were to deprive him of the claim which he has for long service to a certain extent, do you think that would be effective?—I think that that would certainly have a strong effect.

3943. But you would not recommend that the punishment of imprisonment or anything of that kind should be inflicted on a non-commissioned officer without reducing him?—No.

3944. (*Lt.-Gen. Scarlett.*) Would a non-commissioned officer under punishment have the same respect paid to him as a non-commissioned officer not under punishment?—I think that he would if the punishment did not carry any outward appearance of punishment of it.

3945. (*Lt.-Gen. Eyre.*) Has not a commandant of marines the power of summarily reducing a non-commissioned officer to the ranks?—Yes, that power is specially given in the Marine Articles of War. He has the same power in that respect as the colonel of a regiment.

3946. (*Lt.-Gen. Scarlett.*) Would he reduce him for crime, or only for inefficiency?—For crime.

3947. Without a trial?—He can do it, and I know several cases where it has been done, but they have always been strong cases.

3948. (*Chairman.*) Could you make any suggestions to the Commission with regard to punishments for private soldiers?—I quite agree with the evidence of several of the witnesses who have been examined before the Commission, that the powers of a commanding officer for summary punishments might be greatly increased, and that he might be placed more in the position of a magistrate, or perhaps that of a captain in the navy, who can award imprisonment up to three months for certain offences, and who can punish summarily for desertion without a court-martial.

3949. What punishment can a captain in the navy give for desertion?—I think he can go up to 56 days.

3950. Can a captain in the navy award penal servitude?—No, but he can give imprisonment in any gaol, either in the gaol at Lewes or in any civil gaol; and he can inflict forfeiture of pay to a very much larger extent than is allowed to a commading officer in the army.

3951. What is the extent to which a naval officer can award forfeiture of pay?—I believe that there is a scale, and the amount of forfeiture is regulated according to the length of time the men may have been absent. With regard to desertion, perhaps I might be allowed to make one suggestion The Article of War says that the fact of desertion may be legally established in the absence of the man by a regimental court-martial, and the proceedings of that court are received before a court-martial as evidence, and a man can be convicted on it, provided that he is identified. Such being the case, I think that the commanding officer might take the place of the court there. If the fact has been established before a regimental board of officers, and the proceedings of that board can be taken as *de facto* evidence of the desertion before a court, the power to award punishment might, in that case, be placed in the commanding officer's hands the same as it is in the hands of a captain in the navy, without going through the form of a trial. That would lessen the number of regimental courts-martial considerably.

3952. You have been a good deal on board ship, I presume?—I have.

3953. Did you ever find any dissatisfaction among the sailors at the great power which the captain has?—I think not.

3954. Have you ever heard it made a ground of complaint that he has too much power?—No; I have heard individuals complained against, but not the system.

3955. Do you think that there is the same satisfaction in the navy with regard to courts-martial and the power of officers as exists in the army?—As regards the men I think that the men are equally well satisfied, but I am not prepared to say anything about the trials of officers, or what may be the feeling among them.

3956. But from your experience of the feeling of the navy should you have any dread of dissatisfaction in the army if the same powers were given to military officers as are now possessed by naval officers?—I should not.

3957. (*Lt.-Gen. Eyre.*) Do you not think that there is a little difference to be considered in the position of a naval officer in a ship at sea without any but his own resources in that ship and the commanding officer of a regiment ashore with unlimited means?—There is a very great difference, and a naval captain often has great difficulty in carrying out minor punishments, particularly in a small ship. It is one of the greatest difficulties which he has to contend with, and in consequence the scale of punishment is very minutely laid down in the Discipline Act in order to strengthen the hands of the commanding officer.

3958. (*Mr. Mowbray.*) Have you any greater powers of discharge in the marines than there are in the army?—The power of discharge is vested in the Lords of the Admiralty. A marine can only under any circumstances be legally discharged, except by sentence of a court-martial, or by an Admiralty order through the Deputy Adjutant-General. This is specified in the 20th Article of War.

3959. Is he always marked with the letters "B.C." on discharge?—Only when it is ordered by court-martial.

3960. Then there is a discharge by the Admiralty which does not carry with it the marking with the letters "B.C."?—Yes, the marking can only be effected by the sentence of a court-martial.

3961. (*Lt.-Gen. Scarlett.*) Have not a considerable number of marines been discharged without the mark?—Yes, but there are very few now. It was complained of by the Horse Guards, and the Admiralty are more particular now and there are very few such cases.

3962. (*Chairman.*) Is the system of rewards the same in the marines a in the army?—The good-

Col. S. N. Lowder, C.B.

21 May 1868.

conduct pay and good-conduct badges are awarded, under nearly the same regulations, but there is a considerable difference in regard to medals and gratuities. A marine has to serve 21 years before he can become entitled to a medal and gratuity, whereas a soldier can get it in 18 years, and that is considered rather a grievance by the marines.

3963. What is the difference of pay?—The pay is the same. It was raised the other day in the same proportion as the pay in the army.

3964. (*Lt.-Gen. Eyre.*) In a case of insubordination with violence on the part of a seaman on board ship what would be the probable resort of the commanding officer in dealing summarily with them?—Corporal punishment.

3965. And next to that?—Imprisonment.

3966. In irons?—Imprisonment in a gaol. If it was in the Mediterranean he would be sent to Malta; if it was at Halifax he would be sent to the gaol at Halifax. On the home station he would be sent either to Lewes or to the nearest civil gaol.

3967. (*Lieut.-Gen. Scarlett.*) If it were at sea how would he be dealt with?—At sea he would be flogged, I suppose.

3968. (*Lieut.-Gen. Eyre.*) Are they not put in irons?—Yes, sometimes; but it is more for security, I think, than for punishment.

3969. (*Chairman.*) Have you any further suggestions to make with regard to courts-martial?—I have here some statistics as to numbers and per-centages, extending over a period of five years. (*The witness delivered in a statement.*)

3970. Have you any suggestions to make with regard to the appointment of Deputy Judge Advocates?—I should like to see more officers appointed than there are at present. There are only three in the army, I believe.

3971. Do you think that more ought to be appointed?—I think more ought to be appointed. I think that they are of the greatest use, and that they have done very great service towards improving the practice of courts-martial.

3972. Has that been the case in the marine service under your own observation?—We have at present one officer, who has qualified himself; he has been called to the bar. He has received no positive appointment yet, but he officiates at all general courts-martial, and has done so for some months past.

3973. From the amount of experience which you have had of his services, are you inclined to recommend that the same rule should apply in the army?—I think the appointment of this officer is one of the best things which has been done for a very long time for the administration of military law, and I look upon it as a great point gained in the right direction.

3974. Has he attended many courts-martial since his appointment?—Seven or eight. He is now attending one at Portsmouth.

3975. (*Lt.-Gen. Eyre.*) Do you not think that he, being a military officer, his appointment would be more acceptable to the service than a civilian being appointed?—I think it would.

3976. (*Lt.-Gen. Scarlett.*) Has he practised before a civil court?—No, he has gone through a course of study and reading, and has been regularly called to the bar.

3977. (*Chairman.*) You suggest, I understand, that the Deputy Judge Advocates should not be under the rank of lieutenant-colonel?—I certainly think they should not be.

Adjourned to Monday next at 12 o'clock.

Room E. House of Lords.

Monday, 25th May 1868.

PRESENT:

COLONEL THE RIGHT HON. J. WILSON PATTEN IN THE CHAIR.

MARQUIS OF HARTINGTON.
VISCOUNT EVERSLEIGH.
LIEUT.-GENERAL PEEL.
THE RIGHT HON. J. R. MOWBRAY.
THE RIGHT HON. THOMAS E. HEADLAM.
LIEUT.-GENERAL SIR J. YORKE SCARLETT, K.C.B.
MAJOR-GENERAL SIR ALFRED HASTINGS HORSFORD, K.C.B.
LIEUT.-GENERAL HENRY EYRE.
COLONEL S. N. LOWDER.
CAPTAIN THE HON. J. C. W. VIVIAN.

JOHN LLOYD WHARTON, ESQ., *Secretary.*

G. Clifton, Esq.

25 May 1868.

GEORGE CLIFTON, ESQ., called in and examined.

3978. (*Chairman.*) You are the governor of the Portland convict prison, are you not?—I am.

3979. How long have you held that office?—Nearly three years.

3980. Have you held a commission in the army?—No, I have been in the navy.

3981. What rank did you hold in the navy?—I only reached the rank of midshipman, having received an injury at the siege of Acre which compelled me to retire from the service.

3982. Since that time how have you been engaged?—Since the year 1851 I have been employed in the convict service. I was deputy governor and acting governor or superintendent of the convict establishment in Western Australia for nine months in the year 1853, and after that I was one of the visiting magistrates to the same for nearly 10 years. Since my return to England I have been deputy governor of Portland prison, governor of Dartmoor for 12 months, and nearly three years governor of Portland prison.

3983. In the course of that time have you had many military convicts under your care?—Not a large number, but I have had a few; on an average between 30 and 35 at a time. At the present moment I have 30 at Portland.

3984. Are they committed to you by sentence of courts-martial, or have you any other authority to receive them?—Twenty-five of them are committed by sentence of courts-martial, and the others have been tried at sessions at Winchester and elsewhere.

3985. Is that about the average number which you generally have at Portland?—About that number. I have sometimes had a few more and sometimes a few less. There are at the present moment 10 men in addition to those who have been soldiers, but who are now under sentences of penal servitude for other offences. I have had a return prepared with a view of showing each of the different prisons at which they have been, their sentence, and the history of each individual man.

3986. Are those all military prisoners?—Those are all military prisoners.

3987. Are you in the habit of treating the military convicts in the same way as the civil convicts?—Exactly, they are punished in every particular and treated in exactly the same way as ordinary convicts.

3988. What is the longest punishment to a military

convict?—Penal servitude for life; for instance, the two men who were tried at Dublin, and shown on this return.

3989. Are those by sentence at court-martial?—By the sentence of court-martial. They are not Fenians; they are military prisoners, and treated as already described.

3990. They are soldiers who were convicted while in the service of Her Majesty?—While in the service of Her Majesty.

3991. Will you describe the punishments which you inflict in Portland prison, taking, first of all, penal servitude?—The punishments are the same throughout all the different prisons. There are a great variety of them. A prisoner sentenced to penal servitude is placed under the mark system on reception into a convict prison. The minimum number he can earn daily being six, and the maximum eight; for instance a four years man first does nine months' solitary confinement in one of the close prisons, he is then removed to a public works prison, where he has three years and three months to do. If by industry and exemplary conduct he is able to earn eight marks every day, he gains a remission of a quarter of the above period, and is liberated at the end of three years and about nine weeks. If he only earn seven marks he can only gain a remission of one-eighth of his sentence. If a prisoner commits a trifling offence I should inflict a forfeiture of 42 marks, which would detain him seven days longer in prison, but by industry and good conduct he might gain back a fourth of this period. If he forfeits 84 marks, the maximum number in my power to award, he would be detained double the time. There are four different classes, and a prisoner must earn a certain number in each, which entitle him to certain prison privileges, such as more frequent visits, opportunities of writing to his friends once in four, three, and two months, instead of six. He is also eligible for employment in the industrial portion of the prison, for which only exemplary characters are selected. In addition to the above forfeiture of marks the governor has the power to award three days' bread and water, in light or dark cells, and 25 days' penal class diet. If reported for idleness he has the power of depriving him of his mattress while on bread and water.

3992. Do you do that often?—In cases of insubordination I generally award dark cells, as I have found from experience that it does more to tame a man than anything else, from the very fact of his being kept in perfect solitude and in the dark. It is very severe punishment for this reason, that all prisoners undergoing this punishment are visited every hour during the day and night to see that they do not commit suicide, as we are responsible for their safe custody, and if a prisoner committed suicide, the public might turn round on the authorities and complain that proper supervision was not exercised.

3993. Supposing a soldier is committed to your charge for one year, how much of that can he get off?—We never received a man for less than three years, and now the minimum is five years. At Chatham, I believe, the court-martial men are still sent for a three years' sentence.

3994. You appear to be of opinion that the severest punishment which you can inflict on a prisoner is solitary confinement?—Solitary confinement in a dark cell is the severest punishment, with the exception of corporal punishment.

3995. (*Capt. Vivian.*) Is that accompanied with bread and water diet?—That is always accompanied with bread and water diet.

3996. (*Chairman.*) During the whole time that the man is in the dark cell is he kept on bread and water?—The maximum number of hours that he can be kept there by sentence of the governor is 72 hours or three days; but the director of the prison, who has the power of a magistrate, can, I believe, inflict 28 days bread and water in a dark cell.

3997. Can you deprive him of his bed?—If he is reported for idleness, it is an order from the Secretary of State that he be deprived of his bed.

3998. Do you keep him without his bed for three days?—Occasionally, but it is very seldom that he is kept without his bed as long as that. Generally for idleness one day without his bed is quite a sufficient punishment, and that subject to the medical officer's approval.

3999. Do you think that the prisoners look upon it as a boon to get to penal servitude out of doors?—Certainly not in these days.

4000. You do not think that a soldier sentenced to solitary confinement would think it a boon to have that changed to common penal servitude?—I think not.

4001. (*Capt. Vivian.*) That would depend, I suppose, upon the way in which that out of doors punishment was carried out?—It depends upon the way in which it is carried out.

4002. (*Chairman.*) What is the nature of the punishment which you inflict out of doors?—Compelling them to work hard at all sorts of manual labour, such as dressing stone, excavating, and loading trucks, &c. They are employed in every description of trade; they are instructed under prison instructors, so as to give a man the opportunity during the time he is imprisoned of learning as far as possible some trade which may enable him hereafter to earn a livelihood.

4003. In what respect does stone cutting and work of that kind differ from stone cutting out of a prison, except that the man is not paid for it, does he work in chains, for instance?—He does not.

4004. Then in what does it differ?—They are continuously kept under strict discipline, marched backwards and forwards to labour, and not allowed to converse with each other; they work eight and ten hours per diem. The time spent in the prison, between returning from labour and bed time is more monotonous. The prisoners rise every morning at 5 o'clock, they have their cells to clean and are then marched to chapel. Of an evening they receive tuition from the schoolmaster; they are not allowed to have their beds down, or to converse with each other during the time when they are in the cells. They look upon being locked up in their cells as punishment. Being kept from their companions, and not allowed to talk while they are at work is one of the greatest punishments. When they are out of doors they are simply permitted to ask questions about the work, but if they hold any familiar conversation they are reported and punished.

4005. (*Lt.-Gen. Eyre.*) Do the men who have attempted to escape work in chains?—Those who have either committed an assault on an officer or have attempted to effect an escape are put in chains by the director for a period of three or six months.

4006. (*Chairman.*) For a common case of insubordination attended with atrocity what punishment do you inflict?—I should give the man three days bread and water in the dark cells, forfeit 720 marks from his class, that is to say, if he was in the first class he would be put into the second class for three months; and in addition to that he would forfeit 84 marks of his remission of time, which would be taking away 14 days of his remission.

4007. Are you ever obliged to inflict corporal punishment?—Occasionally we have aggravated cases of assault upon officers, and in that case men are always flogged.

4008. What is the number of lashes that you can give?—Thirty-six lashes with a naval cat in the naval fashion.

4009. Have you reason to believe that you could do without corporal punishment?—I think if you were to abolish corporal punishment in a prison of the magnitude of the Portland the lives of the officers would be placed in jeopardy. I believe it is the thing which deters prisoners more than anything else from committing assaults upon officers.

G. Clifton, Esq.
25 May 1868.

4010. In case of an assault how do you proceed to inflict corporal punishment?—The officer who witnessed the assault is examined in the presence of the prisoner, who has an opportunity of cross-questioning him and of making his defence. I take down the whole in writing. The particulars are then submitted on a proper form to the director in London, who at his next visit tries the prisoner, retaking the evidence against him on oath, and awards corporal punishment if the prisoner is found guilty.

4011. Then you have not yourself the power of inflicting corporal punishment?—I have not, for if the governor had the power it might give rise to feelings of revenge.

4012. How long does it take to have this reference to the proper authority?—In an urgent case I have known a director come down within a few hours; if it were not an urgent case it may stand over for a fortnight, and in the meantime the man is put upon light labour diet and kept in a separate cell.

4013. Supposing a law should be passed to abolish corporal punishment in your department, what is the punishment which you yourself would suggest in its place as the most efficacious for preserving discipline for a certain period?—The only one which I can think of in that case would be punishment in dark cells, with penal class diet for a period of nine months, which a director has the power to award.

4014. Would the minds of many men stand that?—They do stand it.

4015. Are there many instances of it?—There are no instances at Portland, I think, where the whole nine months have ever been passed by a prisoner in the penal class, but in the close prisons in London, before they are sent on to the public works, men undergo nine months' solitary confinement.

4016. What is the longest period of solitary confinement which you have heard has been inflicted?—I cannot, without reference, tell you the exact number of days; 180 days is what the director generally gives in cases of assaults, but if the man's conduct is exemplary he will remit a portion of that sentence.

4017. There are two kinds of solitary confinement, I believe, the one being separate confinement and the other being solitary confinement in a cell?—Yes, they are quite different. There is a prison set apart for the governor's punishments and another for the director's punishments. Both of them are in cells, but owing to the lengthened period of solitude that a prisoner may be detained by a director's order, the cells in that prison are much larger and very well ventilated. The director might give a man 28 days' punishment diet to commence with; that would be bread and water for three days, and on every fourth day penal class diet, which is porridge and potatoes and a certain allowance of bread. The penal class diet is continuous after he has once passed through the punishment diet if his conduct is bad, but if good at the expiration of three months he is placed on light labour diet.

4018. When men are committed to your charge by sentences of courts-martial you award the same punishment, I presume, in all cases?—Exactly the same. We know no distinction.

4019. When is it that you first make the distinction in the punishment?—There is no distinction throughout the whole of the sentence. A man is liable to the same punishment in the first class as he was in the probationary class if he commits himself.

4020. Is there no alteration in the nature of the punishment for good conduct?—No. Of course, one always takes into consideration a man's good conduct in inflicting punishment; but still there is the power of inflicting the same punishment.

4021. But the punishment under the sentence is throughout the same in every respect, except that a man by good conduct can shorten his period of punishment?—Yes.

4022. Have you the power of shortening the punishment of a military prisoner?—The whole of the prisoners sentenced to penal servitude come under a set of regulations promulgated by the Secretary of State. We have nothing to do with remission farther than working up the marks upon which it is calculated. Two months before a prisoner has earned his full number of marks to entitle him to be discharged upon licence, his name is submitted to the directors and goes from them to the Secretary of State's office, but it rests with the Secretary of State whether he will liberate him at the time of the expiration of his earning his marks, or whether he thinks it desirable to keep him longer. It is entirely dependent upon the conduct of the man.

4023. The civil magistrate then has no authority whatever in the remission of military punishment?—No magistrate has any power within the walls of a convict prison. The Secretary of State alone grants remission through the directors of convict prisons.

4024. Is there any punishment that you could suggest to the Commission for military prisoners besides those which you inflict in Portland prison which you think would tend to facilitate the maintenance of discipline?—I do not think there is any but the punishment of dark cells. I think that in all cases of insubordinate military prisoners punishment in the dark cells would be the more effectual.

4025. Have you no shot drill?—We have no shot drill. I think that punishment of this description tends to irritate without producing any reformation.

4026. Are you opposed to shot drill altogether?—I think so.

4027. In the generality of cases, should you say that the length of punishment is shortened by good conduct in prison?—Very considerably.

4028. Will you give the Commission an instance in which the largest remission of punishment has taken place in those cases which you have before you?—There are some of the men referred to in the return I produce that have never received any punishment whatever. There is a man, Charles Wentworth, clerk, serjeant of the 17th infantry. He was sentenced for embezzlement, and by sentence of court-martial got five years penal servitude. That man has passed through the whole of his career at Millbank and at Pentonville, where he had his nine months solitude; and he has now come to Portland prison. Since his arrival there his conduct has been exemplary in every respect. He is respectful, industrious, and well conducted, and that man will earn the maximum amount of remission, I have not the least doubt; so that upon his five years sentence he will earn one year and one month remission, so that he will be discharged at the expiration of three years and eleven months.

4029. Did he begin to get advantage from his good conduct before he came to you?—No, he got no advantage until he came to Portland, because he did nine months in solitude, during which time he gained no remission and he must earn 720 marks to complete his year in the probation class on the public works. He must do the whole of the first nine months without earning any remission, and then he commences his career as a public works' prisoner, and if he earns eight every day he gets the full remission. Another advantage attending the marks is, that in each class, except the probation, they have a money value, and a man by industry is earning for himself a gratuity which is paid to him on his discharge from prison. The maximum amount that he can earn is 3*l.*; but if he is a long-sentence man, the last year of his sentence can be worked out in what is called the special class. He can only get into that class provided his conduct has been exemplary through the first class, and then I have the power of recommending him to the directors for an additional gratuity of 3*l.* and a week's extra remission. Here is a man, for instance, who is sentenced for striking a superior officer, and who is under a seven years' penal servitude sentence, and there is one for a civil offence. That man has never earned a single day's remission; he will do the whole of his sentence. He has been bad at Calcutta; he has been bad at Millbank in solitude;

and he has been very bad at Portland. That man will have to do the whole seven years, and when he goes out he will have no gratuity, but will be entirely dependent upon the bounty of the director, who will have power to award him a certain sum for subsistence for a few days to prevent his getting into trouble again at once.

4030. Supposing a greater number of soldiers were committed by sentences of courts-martial to Portland prison, how many do you think you could take in there?—It depends upon the number of vacant cells. Sometimes we could take in 100 at a time.

4031. Are you pretty full on an average?—We have been very full lately. We have 1,571 now.

4032. (*Capt. Vivian.*) You will go on increasing, will you not, now that they do not send them out of the country?—I do not think that the number of prisoners is increasing but in order to keep up the works the prison is maintained at its full strength. It is not that the number of convicts has increased.

4033. But they do not send any convicts abroad now, do they?—They do not, except to Gibraltar.

4034. Will not that tend to increase the number that you have at Portland?—I think it will always enable the director to keep up the full strength.

4035. (*Chairman.*) Do you think, from the experience of past years, that the prison at Portland is capable of being much extended for the purpose of military punishment, the sentences being the same as you have now?—I think there would be no difficulty in the matter.

4036. (*Capt. Vivian.*) Do you think it is a good thing to keep military prisoners in direct association with convicts of a bad class, such as those you have at Portland? — Certainly not, if the soldiers are ever to return to the army. I think that a man like this man Wentworth, or a great number on this sheet, become contaminated from associating with criminals, and that it acts injuriously when they are released from imprisonment. This is a man who will evidently go through the whole of his sentence without any trouble, and will be desirous of commencing the world afresh; but he will suffer from being recognized by released convicts, and reminded that he was once one with them.

4037 (*Chairman.*) Will you state what are the crimes on that paper before you?—Striking a superior officer, desertion, arson, desertion, striking a superior officer and using insubordinate language, striking a superior officer, embezzlement, desertion and making away with great coat, stealing, theft, allowing a private to attempt to commit an unnatural crime, insubordination, stealing, insubordination, desertion and violently resisting his lawful apprehension by firing a loaded rifle, gross insubordination, assault, uttering counterfeit coin, assaulting a superior officer, insubordinate and threatening language, obedience of orders, striking a superior officer, and so on.

4038. They are chiefly offences against military discipline?—Yes; I think with regard to military convicts, where the sentence is awarded for a breach of discipline, that if those men were kept separately, it would be advantageous to them, and that there would be much more hope of reforming them. With regard to arson and stealing, and such crimes, I see no possible reason why they should not be treated in the same manner as other felons.

4039. (*Capt. Vivian.*) But your general opinion is that for men who are to return to the ranks in the army it is better to keep them distinct and separate from civil convicts?—Most decidedly. I have 30 military convicts in Portland now, and 10 others who were formerly soldiers undergoing punishment in the prison at the present time, who have been discharged from the service. In that list there are 16 men with excellent characters for industry and good conduct, that is, more than half of the whole number.

4040. (*Chairman.*) Are all those 16 men sentenced for strictly military offences?—They are all for military offences.

4041. (*Capt. Vivian.*) Are those men sent back to the army when they leave you?—Not if the sentence of the court-martial is over three years. I think that is the maximum time. It has twice occurred that a demand has been made from a commanding officer of a regiment to give up a prisoner at the expiration of his sentence; but in each of those cases, it was not the sentence of a court-martial, and he was held as an ordinary prisoner, and it was not known to me that he was a military man; therefore he was discharged without any communication made with the commanding officer or with the Horse Guards through the directors.

G. Clifton, Esq.

25 May 1868.

4042. (*Chairman.*) But if a soldier is committed to your charge by sentence of court-martial, at the end of his period I presume you inform the commanding officer?—Not if it is over a certain length of time, because they are then never reclaimed.

4043. (*Capt. Vivian.*) A sentence above three years virtually dismisses a man from the army?—I believe so.

4044. (*Lieut.-Gen. Scarlett.*) Was it not the case formerly that a man was always dismissed from the army if he was committed for penal servitude?—Formerly a man was always dismissed the army if he was committed for penal servitude.

4045. But subsequently to that, to prevent men committing crimes for the sake of getting penal servitude, the Commander-in-Chief, and the Adjutant-General, I believe, kept it in their own hands as to whether a man should be dismissed, or not; and, therefore, the man was considered as belonging to the army until the time of his dismissal; was that not so?—I believe that was the case. Military sentences are brought forward in the ordinary manner before the director two months before the sentence expires or before the man has earned his remission, and it rests with him to communicate with the War Office as to whether he should be sent back to his regiment.

4046. (*Chairman.*) But there is the power to discharge the man altogether, is there not, without referring him back in any way to his regiment?—I believe so, if his sentence exceeds a certain number of years. There is no rule to the contrary that I am in possession of. It is constantly done with men who have 10 years. They are treated as other prisoners and are discharged when they become entitled to it.

4047. There is no obligation upon you during a man's confinement under sentence to report him either to the Horse Guards or to the Secretary of State?—Not long-sentence men. It was when there were court-martial sentences of only three years, and when a man could by six months' remission go out in two years and six months; then he would have been eligible to go back to his regiment, but in long sentences it is not obligatory upon me to report the circumstance.

4048. Do they inform you when a soldier comes in how many years service he has in the army?—Generally the court-martial papers and others accompany the caption, and one knows how long the man has been in the army.

4049. But supposing that a man has engaged to serve for 10 years and that under the sentence of a court-martial in his second year of service he is put into your charge for penal servitude, should you feel yourself justified in dismissing him before his period of 10 years is over?—I should have no power to liberate him until he had earned his marks. The sentence is turned into marks, and until he had earned his full number of marks he cannot be liberated, and then it must again be brought under the notice of the Secretary of State before he can be liberated, because it is only under the sign manual of the Secretary of State that he can be discharged.

4050. But supposing a man works out no advantages during five years, and that his period of punishment ends in the seventh year of his service under the Queen, would you hold yourself justified in letting

G. Clifton, Esq.

25 May 1868.

him go at large and not sending him back to his regiment?—That would rest with the directors; it would not rest with me, I should bring it under the notice of the directors.

4051. You are not aware, whether or not that power exists?—I am not.

4052. (*Lieut.-Gen. Peel.*) Are all the prisoners at Portland under sentence of penal servitude?—They are all under penal servitude, at least when I say all there may be some few who are still under the old Transportation Act, and who have not yet completed their sentence, men who had 20 years for instance to do, and who were serving before the Penal Servitude Act came into operation.

4053. But men sentenced merely to imprisonment are never sent there?—Never.

4054. Do you ever employ any of the prisoners at Portland in places of authority over the other prisoners?—Never. The only thing that a good man would be eligible for would be inside berths, such as in the kitchen or in the bakehouse, or amongst the cleaners' party, or berths of that description, where you want men of trust who will not go into another man's cell and touch his things.

4055. Sometimes you have men of a superior class in life; have you not?—Yes.

4056. (*Lieut.-Gen. Scarlett.*) Do you employ them in plan drawing?—Under no circumstances is any prisoner allowed pen, ink, and paper, except at school time, when under the inspection of disciplined officers.

4057. Is he never employed in prison under supervision for the purpose of plan drawing?—Never. It is strictly against the Secretary of State's orders that he should ever be employed for writing purposes.

4058. Is that a late thing?—Within the last few years.

4059. (*Lt.-Gen. Peel.*) Do you consider that the punishment which a man undergoes at Portland is equal to that which he would suffer if it was merely an ordinary imprisonment in another place?—I think that it is more severe.

4060. And therefore if the law is carried into effect of not sending men committed to penal servitude out of the country, there would be no object in a man who was sentenced to imprisonment committing a crime in order to be sentenced to penal servitude?—I do not think so. The proof of it is this; that in days gone by when prisoners were liberated they very soon came back to prison, whereas the diminution of re-convictions is very great since the introduction of the Penal Servitude Act. None have been sent to Western Australia for some time, and the last were sent to Gibraltar about a month ago.

4061. Do you know the nature of the punishments at Gibraltar?—I do not, but I believe they are the same as in operation here.

4062. (*Lt.-Gen. Eyre.*) In some armies in violent cases requiring prompt and summary dealing they have what they call short chains, which means, in reality, chaining a man hand and feet together for six hours, and not longer; as a practical man how would you view that kind of punishment?—I think in all those cases it rather has a tendency to irritate men without producing any permanent and good effect upon them.

4063. It is, in your opinion, no improvement upon what you can carry out yourself at present?—In the event of a man being violent I can put him in handcuffs for a few hours just to restrain him, and very often the man will thank me afterwards. When the fit of temper has passed off he will express his regret; but I think as a general rule any length of time in irons or chains only frets or irritates a man.

4064. What you propose answers the purpose just as well?—Just as well; merely restraining and preventing him from committing himself at the time is all that is necessary.

4065. (*Mr. Headlam.*) You have found the dark cells most effective, have you not?—I think so. Nothing in my opinion is so taming as the dark cells.

4066. (*Capt. Vivian.*) And bread and water diet?—And bread and water diet.

4067. (*Mr. Headlam.*) Have you ever known any man suffer permanent injury from the dark cells in mind or otherwise?—I do not think so; but they are constantly visited by officers, and in the event of their being in the slightest degree ill they are visited by the medical officer, who would recommend their being liberated if he saw the slightest ground for it.

4068. (*Chairman.*) Does a medical officer visit the prisoners in the dark cells?—Every day he sees the prisoners in all the punishment cells, and if he remarks that any man is suffering he notifies the fact to me in writing, and that man is immediately liberated and returns to his ordinary work.

4069. (*Mr. Headlam.*) Have you ever known them attempt to commit suicide?—Not in the dark cells. We have had several cases of attempts to commit suicide during the past year, but I think more with a view to intimidation, and with a hope of getting into the hospital than anything else.

4070. They were not in reality true attempts?—No, they were feigned attempts, I think. We had last year 13 attempts altogether; eight were feigned and five were real. Two men did commit suicide; one man was a soldier and a man who had been in the army throughout the whole of his career noted for his violence. He would lose his temper and become violent and make use of the most threatening language; he commited suicide in a fit of temper by throwing himself over the rails. He was confined for stealing.

4071. You stated with regard to corporal punishment that you thought that if it was done away with the lives of the governor and the officers would scarcely be safe; do you think that corporal punishment is valuable with reference to the man himself, or with reference to the effect which it produces upon others?—Both: I think that the bodily pain deters some men from committing a second assault, and it also deters others from following their example. I find that when corporal punishment has been inflicted for assault in the prison everything will go on quietly for weeks afterwards. Sometimes a man gets cut down by an officer with his sword; he is justified in using the sword in self-defence.

4072. (*Capt. Vivian.*) What force have you to keep those 1,500 prisoners?—A civil guard of 40 men, and a superintendent and two serjeants.

4073. (*Lt.-Gen. Scarlett.*) Is not a regiment, or part of a regiment, quartered at Verne Hill?—There is the head-quarters of a regiment there with about 300 men. We have the Snider rifle and buck shot, and cartridges of nine shot. I think that during the past year the returns I have sent to the directors show that the punishments were one half per cent. per diem, and that there were about 1,000 men in the prison who have scarcely ever had a report against them.

4074. (*Mr. Headlam.*) What length of service should you say is the most effective for the reclamation of men?—I think that if a man is not reclaimed after a punishment of three or four years in a penal establishment there is very little chance of his ever being so.

4075. Do you think a penal servitude of as much as three or four years has a reclamatory effect?—Three years, I think has.

4076. What is the effect of a punishment for, say, one year?—I do not think that prisoners would dread it much.

4077. Do you think that however sharp you made the punishment during a single year it would not be sufficient?—No; I think that I have observed that the seven years' men dread the punishment much more than the five years' men.

4078. With respect to a man who has gone through a punishment for three years, do you think that you have fair ground for supposing that if he be subjected to temptation in after life he will conduct himself

G. Clifton, Esq.

25 May 1868.

well?—A great many of them do, but there are a very great many exceptions.

4079. Do you think that there is a better chance of a man's behaving well in after life, say, after a punishment of three years, rather than after a punishment of a shorter duration?—I think so. The leader of the mutiny at Portland a few years ago had been a soldier. He was a man who had committed assaults upon his officers, and had been violent in prison. I thought I saw through the man's character and could handle him, and in the middle of the mutiny he and three others threatening to knock my brains out. However, I touched a chord in the man's heart, and in the height of the mutiny he and his companions walked with me through the whole of the men up to the prison; he said: "I hope you will do something "for me, sir." I held out no hope of his not being punished, but I said, "If after you have been punished "you will turn over a new leaf, and I can assist you "in any way, I shall be glad to do so." That man was never reported afterwards, and he has gone out now and is doing very well. He said, "You are the "first person, sir, that ever spoke to me quietly and "pointed out the errors of my ways. I have been "sworn at and irritated, but you held out some little "hope to me, and I saw a ray of hope." I have heard of him since he has been out, and he is a useful member of society, and a very quiet and well conducted man, but he was the dread of everybody in the prison.

4080. Would it not be dangerous to have the military convicts mixed up with the other prisoners?—I think not; but undesirable if they are to return to the army. They are under strict discipline and easily controlled.

4081. (*Capt. Vivian.*) Are you all on the silent system at Portland?—Yes, as far as it is possible to maintain silence. They are not allowed to talk in their cells, or on the public works, but while they are actually at labour they may ask for tools, &c. Perfect silence is maintained on parades, &c.

4082. But still they do manage to communicate with one another, do they not?—They do communicate occasionally with one another by signals.

The witness withdrew.

The Right Hon. J. R. Mowbray.

The Right Honourable John Robert Mowbray, a member of the Commission, examined.

4083. (*Chairman.*) How long have you held the office of Judge Advocate-General?—From March 1858 to June 1859, and from July 1866 to the present time.

4084. During the time that you have filled that office have you formed any opinion with regard to the nature of the laws and the customs of the army on which courts-martial have to form their judgments?—With respect to the custom of the army, of course my opinion can be but derived from a limited knowledge. With respect to military law I have a very decided opinion that it is in a very confused, uncertain, and conflicting state. The volume which I hold in my hand, and which is transmitted annually to each regiment, I believe, by direction of the Secretary of State for War contains the Mutiny Act and seven other Acts of Parliament, and also the Articles of War; but in addition to that the military law is to be found in the Queen's Regulations and in the War Office Regulations; and I have continually occasion to refer in connexion with courts-martial to sundry Royal Warrants with reference to pay and promotion. Now I find that in the Queen's Regulations it is stated that it is incumbent upon all officers to apply themselves diligently to the acquirement of a competent knowledge of military law, and of the orders and regulations founded thereon; but I consider that this is a very difficult task which is imposed upon officers when they are to become members of courts-martial, because I think that military law is in a condition which is perplexing even to lawyers, and I should be afraid that it must often be utterly unintelligible to soldiers.

4085. Can you give any instances where this difficulty specially arises?—I should say that it arises partly from the want of any sort of arrangement or any correspondence in the various parts between the Mutiny Act and the Articles of War. You do not find the same provision or provisions intended to have the same effect in the corresponding parts of the Mutiny Act and the Articles of War, the truth being that the Mutiny Act, I believe, requires to be rewritten. It has been renewed annually from the time when the first Mutiny Act was passed in the year 1689 to the present day; but it has never been redrawn, though it has been annually, I may say, patched and tinkered as occasion required.

4086. Can you show us any prominent instance of the difficulty which you have now suggested?—I do not think that I could show any prominent instance, because I think that it would be a great reflection upon the office which I hold if there were any glaring anomalies or any direct contradictions. No doubt there are various details in which I might show that they are conflicting, but as it is the custom to mend a hole as it arises each year, there is nothing that I would say is very glaring. I could give a number of instances, but I think it would rather tend to perplex the Commission than to enlighten them. What I think is that the Mutiny Act requires to be redrawn in a comprehensive spirit by some one possessing a full knowledge of military law as it exists at present. Now my view, which would maintain both the theory and the practice of the constitution with respect to the existence of a standing army, would be this: that the Mutiny Act should be an annual Act, as it is at present, and that it should be required to be renewed from year to year. I would also have the Articles of War promulgated as they are at present once a year, and I see no reason whatever why, as has been sometimes desired, they should not, as soon as they have been promulgated by the authority of the Crown, be laid upon the table of each House of Parliament. In that way the Mutiny Act would become much simpler. In the first place it would authorize, as it does at present, the number of men to be raised from year to year, and then I think the Mutiny Act would be in two parts, one part being much more in detail and the other part being more general. First of all, I would have the Mutiny Act provide in detail for what I should term the municipal relations of the army; that is to say, there would be provisions for the process of converting a citizen into a soldier by enlistment and attestation, and so forth; and then there would be provisions in detail as to the relations of citizens to the army in respect of billets and the duty of justices and gaolers, and so forth. Then as regards military law I would have it more general. I would authorize, by the Mutiny Act, the creation by the Crown of a military code for the maintenance of the discipline of the army, subject to such restrictions and limitations as Parliament might think fit to impose; and of course among those restrictions there would be, as there is at present, a limitation of the term of imprisonment, and regulations as to cases of death and penal servitude, and so forth. Then the Articles of War being issued under the authority of the Mutiny Act, they should provide in detail for trials by courts-martial, and they would be, as I believe they are practically at present, the code to which all officers would recur upon trials by court-martial. I do not think that you could do away with the Articles of War altogether. I believe that some persons have been of opinion that you might simply have a Mutiny Act, but I think it would be absolutely necessary to retain the Articles of War. First of all because experience showed that it was necessary to have them; for the first 28 years, from 1689 to 1717, there was a Mutiny Act alone, without Articles of War; and it was then

The Right Hon. J. R. Mowbray.

25 May 1868.

found necessary to give the Crown power to make Articles of War. In fact I look upon the Articles of War, proceeding from the Crown and being framed under the authority of the Mutiny Act, as corresponding very much to what is now becoming so common, namely, the Orders in Council, which you find, for instance, with respect to the cattle plague and the proceedings of the Ecclesiastical Commissioners. There are a number of cases in which general powers are given to the Crown and are carried out in detail by Orders in Council. So I would have the Crown carry out in detail by the Articles of War the powers conferred on it by the Mutiny Act. The Articles of War are necessarily more elastic than the Mutiny Act, and from time to time it is very convenient to provide for a number of cases which it is not necessary to put into an Act of Parliament. For instance, before this year trials by court-martial were to be held between eight o'clock in the morning and four o'clock in the afternoon. It is obviously very inconvenient sometimes that a trial should be broken off at four o'clock in the afternoon, because a witness may perhaps be under cross-examination who is a prevaricating witness, and he is stopped in the middle of cross-examination, and before the next day he has had an opportunity of getting up some false story to corroborate what he said the day before. I have therefore provided this year in the Articles of War that "if the court considers it necessary, they may "continue any trial beyond the hour of four in the "afternoon, recording in the proceedings their reason "for so doing." Then there is another provision in the Articles of War this year, which I thought it important to put in, which arose out of the Jamaica case. A great deal turned in the Jamaica case, where the officers on that trial were charged with murder, upon the view of the spot, and I suggested that the court should go to the spot and view it; but that was a thing of which there had been no instance before, and for which there was no provision in the Articles of War. I mention those two cases, though I might mention many other similar illustrations of the convenience of putting those things from time to time in the Articles of War without their being tied up in an Act of Parliament.

4087. Supposing that the court had not complied with your direction to visit the spot, would that have vitiated the court?—I am not prepared to say that it would, but I gave my suggestion to the Judge Advocate, who proceeded from England, and he took care that it was followed out.

4088. But where does that order appear now?—That order would not appear anywhere.

4089. But you look upon it as equally valid as an Article of War?—No. It was a suggestion which I gave to the Judge Advocate who proceeded to Jamaica as my representative to see that it was done, and I did not contemplate the possibility of any court refusing to take the step so suggested.

4090. (*Lt.-Gen. Peel.*) Do you mean to say that the court had not the power of going to view the spot without directions from you?—I do not say that they had not the power, but I suggested the expediency of their doing so.

4091. Do you attribute the number of revisions of courts-martial in any way to the confusion which you have just described?—I do not know that I attribute the revisions to this. The revision sometimes turns upon the view taken as to the facts, and sometimes upon the law. It is difficult to say what a revision turns upon.

4092. But do you think that it is the inability of courts-martial to comprehend the bearing of the Articles of War, the Mutiny Act, the Queen's Regulations, and the War Office Regulations, which sometimes leads to the necessity of a revision of a court-martial?—I think, as I have said before, that there are so many Acts of Parliament, and there are the Articles of War, and there are the Queen's Regulations and the War Office Regulations, and so many Royal Warrants to be considered from time to time, that it is very difficult indeed, even for a lawyer, to arrive at a precise view of what the law is. I always hold that the Act of Parliament is supreme, but it may often be puzzling to a soldier. If there is any amount of conflict between an Act of Parliament and the Articles of War or the Queen's Regulations, he perhaps does not see the superior authority of the Act of Parliament.

4093. Could you give the Commission any evidence as to the instances in which those difficulties to which you have just now alluded have occurred in the findings of courts-martial?—Something like 8,000 general and district courts-martial pass in the year through the office, and points arise upon them from day to day of all kinds.

4094. Are you speaking of both regimental, district, and general courts-martial?—I am not speaking now of regimental courts-martial. I am excluding regimental courts-martial. I have a list here, which I will hand in, of the total number of courts-martial which have passed through the office since the year 1829.

The witness delivered in the following table:—

Year.	District Courts-Martial.	General Courts-Martial.		Total.
	District.	Home.	Abroad.	
1829	805	107	119	1,031
1830	1,904	92	198	2,194
1831	3,616	111	198	3,925
1832	4,928	150	291	5,369
1833	5,912	185	264	6,361
1834	6,187	162	357	6,706
1835	5,939	172	316	6,427
1836	5,148	125	346	5,619
1837	5,955	116	305	6,376
1838	5,575	118	406	6,099
1839	5,269	114	391	5,774
1840	5,515	121	240	5,876
1841	5,406	87	260	5,753
1842	4,916	85	220	5,221
1843	4,835	84	223	5,142
1844	4,809	109	215	5,133
1845	4,703	81	201	4,985
1846	4,700	54	172	4,926
1847	5,603	101	285	5,989
1848	5,881	86	224	6,191
1849	5,262	110	169	5,541
1850	4,469	75	206	4,750
1851	3,788	54	158	4,000
1852	4,002	48	157	4,207
1853	4,172	45	129	4,346
1854	4,582	14	121	4,717
1855	8,978	12	159	9,149
1856	8,523	48	139	8,710
1857	6,115	42	214	6,371
1858	8,842	61	127	9,030
1859	8,645	75	129	8,844
1860	8,128	133	178	8,439
1861	7,837	100	211	8,148
1862	7,582	109	445	8,136
1863	7,582	102	295	7,979
1864	7,413	56	304	7,773
1865	7,492	28	175	7,695
1866	7,655	50	145	7,850
1867	7,295	46	218	7,559
1868 (Up to May.)	2,271	13	26	2,310

4095. Does that include India?—It excludes India.

4096. (*Lt.-Gen. Eyre.*) Have you the number of the average force?—No, that might be found from the Mutiny Act of each year. The paper which I have handed in contains from 1829 to 1867, both inclusive, the number of district courts-martial, the number of general courts-martial at home, and of general courts-martial abroad, and the total.

4097. (*Capt. Vivian.*) Have the general courts-martial increased or decreased in proportion to the other courts-martial?—In the last 10 years there have

been 760 general courts-martial held at home (the number abroad is larger), or an average of 76 a year. In the preceding 10 years, from 1848 to 1857, there were 534 general courts-martial, giving an average of 53 a year. If I take the last 20 years there has been an average of 64 general courts-martial held at home during each year; but in consequence of a general order in the year 1864, recommending that only the more important cases should be tried by general courts-martial, I think that there has rather been a tendency to diminish the number, and it is possible that the number in future may be below the average of 64. Taking the last three years for instance; in the year 1865 there were only 28; in 1866 there were 50; and in 1867 there were 46.

4098. But the offences which used formerly to be dealt with by general courts-martial are dealt with now by district courts-martial, are they not?—Some of them are.

4099. (*Chairman.*) Have you to mark your opinion upon those, or are they merely recorded in your office?—The course pursued is this: every general court-martial, as soon as it comes into my office, is perused by my deputy and by myself, and after that I have to submit it to Her Majesty for confirmation. In a case of acquittal, by a change which was effected in October 1866, soon after I came into office, as soon as I am satisfied of the propriety of the acquittal I transmit the proceedings to Her Majesty in a box, usually the same day, and I receive them back again from Her Majesty directly; and at the same time that I transmit them to Her Majesty I send the proceedings over to the Horse Guards, and inform the Commander-in-Chief of the advice which I am about to tender to Her Majesty; and when I receive Her Majesty's approval, I then communicate that approval to the Commander-in-Chief, so that there shall be no delay. In cases where I advise Her Majesty to confirm and approve convictions, then I obtain the approval of Her Majesty at a personal audience from time to time.

4100. (*Capt. Vivian.*) Then do you submit all courts-martial to Her Majesty, and not to the Commander-in-Chief?—I submit all general courts-martial to Her Majesty. With respect to general courts-martial abroad, for the most part they are confirmed abroad. Some of them at the more distant and smaller commands require confirmation by the Crown in cases of death, penal servitude, and cashiering, but the Commander-in-Chief in India and the Commander-in-Chief in China have very great powers, they can confirm all cases. With respect to district courts-martial, those at home are read by the District Judge Advocates, and my attention is called to any case in which there is in the proceedings anything irregular or deviating from the ordinary course of things. With respect to district courts-martial abroad, they are confirmed abroad and are sent home. They are then read either by my deputy or myself. Every district court-martial is read by some one connected with my office. My attention is called to anything which is irregular in any of them, and if the irregularity is such as to vitiate the proceedings I write to the General commanding abroad to set aside the whole proceeding, or to suggest a remission of the punishment, or whatever the case may appear to require.

4101. (*Lt.-Gen. Peel.*) With regard to cases of acquittal, you say when they come to you you forward them immediately to the Queen, but have they not to pass through the revising officer's hands before they come to you?—No; I am speaking of a general court-martial where the Queen is the confirming officer, acting upon the advice of the Judge Advocate-General.

4102. Not the Commander-in-Chief, or the commanding officer of the district?—The officer of the district has nothing to do with it. The Crown is subsequently advised by the Commander-in-Chief after receiving the advice of the Judge Advocate-General. The advice of the Judge Advocate-General, as I understand it, is as to the regularity of the proceedings in point of law. As to the advice of the Commander-in-Chief, His Royal Highness will probably himself be able to state upon what points his advice is tendered to Her Majesty. I apprehend that the advice of the Commander-in-Chief has reference to the fitness of the sentence with regard to the offence.

4103. Are there any instances in which you have recommended the reversal of the decision of a court in a case of acquittal?—I have never done so in a single instance, and I do not myself contemplate the probability of it. So strong is my opinion about the propriety of an acquittal being maintained, that I hardly contemplate the possibility of ever advising Her Majesty to reverse such a decision in the case of a general court-martial.

4104. Do you see any objection to a verdict of acquittal being at once pronounced by the court?—I see no objection to it whatever in the natural course of things, but it would be of course a deviation from the practice hitherto pursued of the matter being brought personally before the Sovereign.

4105. (*Capt. Vivian.*) You see no objection to the acquittal being pronounced at once?—I see no objection to it.

4106. Supposing that you require courts-martial to be certified by the Judge Advocate-General first of all in order that he may see that everything has been conducted according to military law?—I think it is desirable that it should pass through the Judge Advocate-General's office.

4107. (*Marquis of Hartington.*) You have touched upon the point, but would you state exactly what you consider to be the relative authority of the Articles of War as compared with the provisions of the Mutiny Act?—I consider that in any conflict between the Articles of War and the Mutiny Act the Mutiny Act, as being the law of the land enacted by Parliament, must be supreme. The Articles of War derive their authority from the first clause of the Mutiny Act, which provides that "It shall be lawful "for Her Majesty to make Articles of War for the "better government of Her Majesty's army," and then it provides, "that no person within the United "Kingdom of Great Britain and Ireland or within "the British Isles shall by such Articles of War be "subject to suffer any punishment extending to life "or limb, or to be kept in penal servitude, except for "crimes which are by this Act expressly made liable "to such punishments as aforesaid, or shall be subject, "with reference to any crimes made punishable by "this Act to be punished in any manner which shall "not accord with the provisions of this Act."

4108. If it should happen that the Articles of War and the Mutiny Act or any other Act of Parliament should conflict, you think the Act of Parliament should of course be supreme?—Clearly.

4109. But in cases where they do not conflict, do you consider that that provision of the Mutiny Act confers the force of law upon the Articles of War made by Her Majesty?—Yes, in cases where they do not conflict, certainly.

4110. (*Lt.-Gen. Eyre.*) Are not the Articles of War meant to illustrate the Mutiny Act?—They are intended to go into a detail into which the Act does not go. I have stated that I compare them to the Orders in Council which were issued during the time that the cattle plague raged in this country. We had Acts of Parliament passed, but those Acts of Parliament were worked out by means of Orders in Council; that is to say, you could not be altering an Act of Parliament in detail every week, but the Privy council could sit every week, or as often as might be required from day to day, and they could make new orders to meet the emergencies of the case. I apprehend that the Articles of War provide in detail for that which it is not desirable to tie up in an Act of Parliament.

4111. (*Lt.-Gen. Peel.*) Who is responsible for the framing of the Articles of War, and seeing that they agree with the Mutiny Act?—I apprehend that the Secretary of State for War is responsible for that.

The Right Hon. J. R. Mowbray.

25 May 1868.

4112. Does he not take the advice of the Judge Advocate-General?—He usually takes the advice of the Judge Advocate-General, but I apprehend that the Secretary of State for War would be responsible. The practice is for the Secretary of State for War to communicate from the War Office with the Judge Advocate-General from time to time during the year as to the changes to be made in the Mutiny Act and the Articles of War. Some of these changes originate with the Secretary of State for War, some of them in the Judge Advocate-General's own department if he has observed the necessity for them during the year, and some of them arise from changes in the Mutiny Bill during its progress through either House of Parliament before it has become law.

4113. Is it not the Articles of War which are to be judicially taken notice of, and not the Mutiny Act, the words in the Act being, "It shall be lawful for "Her Majesty to make Articles of War for the better "government of Her Majesty's army, which Articles "shall be judicially taken notice of by all judges "and in all courts whatsoever"?—Yes, they are judicially taken notice of as being the Articles of War framed by the Crown; but I apprehend that if a point arose in one of the Courts of Westminster where there was a conflict between the Mutiny Act and the Articles of War, if the Article of War was found to have exceeded or to be contrary to the provisions of the Mutiny Act, the judge would hold that the Mutiny Act was supreme.

4114. You propose, do you not, that the Articles of War should be laid before the House of Commons?—I have stated that I think that after the Mutiny Act is passed there would be no objection to the Articles of War, which are framed in pursuance of that Mutiny Act, being laid upon the tables of both Houses of Parliament, if it were desirable.

4115. Would you call in Parliament to interfere with the Articles of War?—I would not.

4116. Then do you merely mean that, as a matter of curiosity, the Articles of War should be laid upon the table of the House of Commons? Are they not in fact now laid upon the table of the House?—No.

4117. With whom, in your opinion, does the responsibility rest as to the agreement of the Articles of War with the Mutiny Act?—I apprehend that the Secretary of State for War is responsible that the Articles of War correspond with the Mutiny Act, and that in order to inform himself of the way in which he shall discharge that responsibility he takes the advice of the Judge Advocate-General.

4118. Then you do not say that the responsibility rests with the Judge Advocate-General?—No. I think that the responsibility rests with the Secretary of State of War, because he is supreme.

4119. (*Chairman.*) Do you consider yourself to be in the same relation to the Secretary of State for War, with regard to military law, as the legal advisers of the Crown are to the Government?—I consider that I am the legal adviser to the Secretary of State for War whenever I am consulted by him.

4120. (*Lt.-Gen. Peel.*) You do not consider that you are responsible for the framing of the Articles of War unless you are appealed to by the Secretary of State for War?—No. I think I may add to that that both the Mutiny Act and the Articles of War are prepared and edited in the War Office.

4121. (*Chairman.*) You have alluded to some alterations which you have suggested in the Articles of War in the present session; is it not the case that you had nothing to do with those Articles of War the moment they left your office, and that they might have been rejected or adopted without reference to you?—They might have been rejected or adopted. Of course I feel it to be my duty in the course of each year to suggest such amendments as my observation and experience may lead me to think proper in either the Mutiny Act or the Articles of War for the ensuing year, if they are submitted to me; but it is for the Secretary of State either to reject or to accept my suggestions.

4122. (*Lt.-Gen. Peel.*) Taking, for instance, the case that you yourself mentioned when you sent out instructions to the court-martial in Jamaica, did you consult the Secretary of State on that matter?—I did not, because that was a matter in my own department. That was a judicial investigation for the conduct of which I was myself responsible.

4123. But yet I thought you understood to say that you considered it was contrary to the usual custom to direct the court to go and visit this place?—I did not think it was contrary to the usual custom, but I believed it was without precedent, and I believed that without my direct sanction the court might not think it necessary to take any such step; and therefore to obviate any possible difficulty I gave instructions beforehand.

4124. But that was an alteration in the Articles of War, was it not?—It was not an alteration in the Articles of War, because there was nothing in the Articles of War to render it improper to be done; but as there was no precedent I gave directions for it in this case. It was clearly legal. But in order that, if another case arose in which it might be necessary that a court should act without direct reference to the Judge Advocate-General they might do so, I provided an Article of War which would suggest that idea to the minds of any court if they thought it necessary.

4125. With regard to the opinion which you have given, that any sentence is not illegal if it is not forbidden by the terms of any enactment or regulation, do you adhere to that opinion, and if so, how do you reconcile that with the provision in the Mutiny Act, that the Articles of War are to be submitted to the judges, and that with reference to any crimes made punishable by the Act no person is to be punished in any manner which shall not accord with the provisions of the Act?—I would observe in the first place that the Articles of War are not submitted to the judges, though they are to be judicially taken notice of by the judges after their promulgation.

4126. But are not these the words: "And copies of "the same, printed by the Queen's printer, shall, as "soon as may be after the same shall have been made "and established by Her Majesty, be transmitted by "Her Majesty's Secretary of State for the War Department, to the judges of Her Majesty's superior "courts at Westminster, Dublin, and Edinburgh, "respectively"?—They are transmitted to the judges for the information of the judges, but the judges do not give any sanction to them, and the judges are not consulted upon them.

4127. (*Maj.-Gen. Horsford.*) They are not submitted, but transmitted?—They are not submitted, but transmitted.

4128. (*Lt.-Gen. Peel.*) But by this Act you have enabled Her Majesty to frame Articles of War, which Articles of War become the law of the land?—Yes, subject to the provision of the Mutiny Act, "That "no person within the United Kingdom of Great "Britain and Ireland, or within the British Isles, "shall by such Articles of War be subject to suffer "any punishment extending to life or limb, or to be "kept in penal servitude, except for crimes which are "by this Act expressly made liable to such punish-"ments as aforesaid, or shall be subject with reference "to any crimes made punishable by this Act, to be "punished in any manner which shall not accord with "the provisions of this Act."

4129. With reference to this how would you reconcile the opinion given that a sentence was not illegal if it did not correspond with the provisions of this Act?—The sentence to which you refer was a sentence of reduction. I find in the Articles of War a provision for reduction to the ranks. I applied to that Article of War the general principle of law, *omne majus continet in se minus;* and therefore I thought that there was nothing contrary to the provisions of the law in saying that a sentence of reduction less than that of reduction to the ranks would

not be illegal, as it was not contrary either to the Mutiny Act or to the Articles of War.

4130. But did you not go on to explain that it was contrary to the usage of the service?—I went on to state that I thought that such a punishment should not be introduced without authority, as I found no precedent for it.

4131. But would that not bring it within these words, "With reference to any crimes made punish-" able by this Act, to be punished in any manner " which shall not accord with the provisions of this " Act"?—I thought not, because I found an Article of War framed under the provisions of the Mutiny Act providing for reduction to the ranks. As I said before I applied the principle *omne majus continet in se minus*. Reduction to the ranks contains in it the power of giving a reduction less than reduction to the ranks, and therefore I thought there was nothing inconsistent, either with the Mutiny Act or with the Articles of War, in holding such a sentence legal.

4132. (*Lt.-Gen. Scarlett.*) Do you believe that sentence to be according to the usages of the service?—My letter went on to state that I could find no precedent for it, and therefore I thought it ought not to be introduced without authority; but I apprehend if authority had sanctioned such a punishment there would have been nothing in the Articles of War or the Mutiny Act to have rendered it illegal.

4133. But it was not according to the custom of war in like cases?—No. But, I may add that, in a case nearly analogous, a sentence nearly similar and also without precedent had been sanctioned by authority, on a schoolmaster.

4134. (*Marquis of Hartington.*) I understand you to suggest that the Articles of War should have an authority analogous to that of an Order in Council under an Act of Parliament?—I did not suggest that they should have it. I suggested that as an analogous instance, as showing the convenience of having some more elastic provision than an Act of Parliament.

4135. But with regard to the ordinary criminal law of the land that is not found necessary, is it; ordinary criminal offences in civil life being dealt with under Acts of Parliament?—I suggested that the Mutiny Act should still contain the same restrictions as to punishments extending to life or limb as at present. I would not in any way diminish the restrictions of the Mutiny Act, but I think there is a convenience in the Articles of War providing in detail for the punishment of offences.

4136. You do not think that if the Mutiny Act were re-written, as you suggest it should be, that would be sufficient as regards law, and that the Queen's Regulations might contain everything that was necessary relating to practice?—It might be so, it was merely the mode of doing it. I think probably the more convenient mode would be that which I suggest, and one reason which I give for it is, that it was found necessary after 28 years of experience of the first Mutiny Act to give the Crown power to frame Articles of War.

4137. But the attempt was not made then to re-write the Mutiny Act?—No, and I am afraid the attempt has never been made from that day to this.

4138. But might not a revised Mutiny Act render it unnecessary to have anything more than regulations as regards practice?—It might. As I have said, I consider it is merely a *modus operandi;* and if it was thought fit to make the Mutiny Act like the Naval Discipline Act, and to enact the Articles of War in the Mutiny Act, I see no objection to doing it; but I think the Mutiny Act should remain as it is at present, an annual Act.

4139. (*Chairman.*) In your office you, I believe, often have to prepare the charges for a court-martial?—In almost every case, where application is made for a general court-martial, it is the practice to request the Judge Advocate-General to settle the charges, and that is a point upon which I think it is highly desirable that a change should be made.

4140. What change would you suggest?—I think that the charges should be prepared by a legal assistant attached to the office of the Adjutant-General. I believe it is ordinarily the practice that application is made to the Horse Guards for sanction of a general court-martial, or to the General commanding in Ireland, and I think that there should be a legal assistant, a kind of clerk of indictments, or whatever you may term him, attached to the office of the Adjutant-General, whose duty it should be to prepare the charges and advise on the evidence. It has been stated by a witness who has been examined here, Mr. Vernon Harcourt, in reference to a particular case to which he alluded, that witnesses were examined in the Judge Advocate-General's office. I can only state my own experience that I never saw or heard of any witness ever being examined in the Judge Advocate-General's office with reference to any trial. The ordinary course is, for an application to be made, as I have stated, by the General who has ordered the court-martial. He incloses a statement of the evidence and the charges, which he submits to my office to be settled. Then those charges are settled, and there is a common form, of which I have a copy here, in which they are sent out from the Judge Advocate-General's office:—

"Sir,

"I have the honour to acknowledge the receipt of your letter of the preferred against , and requesting my opinion whether in a fit state for investigation before a general court-martial.

"In reply I have to acquaint you appear to me in a fit state for investigation before a general court-martial.

"Of course, if any of the facts are incorrectly stated in the charge, the necessary alterations will be made by the officer preferring the same.

"I have the honour to be,

"Sir,

"Your most obedient Servant."

With respect to what was stated about depositions having been taken, I have at the request of Mr. Headlam made inquiries in the office, and I cannot find that any depositions were taken previous to that trial, or that any application was ever made to the office for the depositions. The letter books of the year, beginning at an early period and extending to a period over the termination of that trial, have all been searched, and they contain no application whatever for any depositions. With respect to the case generally, of course the charges are ordinarily settled by my deputy, and I see them; but I never feel that I am in any way enlisted or interested in any prosecution. I desire to reserve myself both as to the legal framing of the charges and as to the evidence, in a perfect state of impartiality when the case comes up to me as (what I consider I am practically) the ultimate court of appeal; but I think it is very desirable that the Judge Advocate-General should be entirely relieved of what is one of the most unpleasant parts of his duties, viz., having anything to do with advising the prosecution or settling the charges, but that he should remain in a perfectly impartial position, so that when the case comes before him, after being fully tried, he should be free to deal with the charges as he finds them, and to state whether they are legal or not, and to decide whether or not the evidence bears out the conviction.

4141. (*Lt.-Gen. Peel.*) Then would you not submit to anyone previously to the trial the question whether the charges were legal or illegal?—Yes, I think there should be attached to the office of the Adjutant-General at the Horse Guards and to any other office that might be thought necessary in Ireland, a legal adviser who should settle the charges and deal with the evidence. I would have the procedure of the court correspond to the ordinary course of pro-

The Right Hon. J. R. Mowbray.

25 May 1868.

ceedings in a criminal court. The clerk of indictments prepares the indictment, and then, when exception is taken to that indictment, the judge rules as to whether it is right or wrong.

4142. That is previous to the trial?—No, when the case is brought on. No judge has to settle before a trial the way in which a charge is to be framed which he is afterwards to try.

4143. But he would point out previous to the trial any illegality in the charge, would he not?—I think the Judge Advocate-General should be in the position of a judge in a criminal court, that the case should be got up and the charges settled, and that then he should deal with it.

4144. (*Chairman.*) Is the Judge Advocate exactly in the position of a judge in a court; is not the president of the court the person who is in the position of the judge?—The Judge Advocate-General is really more and more becoming a sort of court of appeal in military matters. That I apprehend to be his true position. It is so virtually at present, but it is impossible that the court of appeal can approach a case in an impartial and judicial sense if the individual who forms the court of appeal has his own personal feelings enlisted in support of the charges, by having himself drawn the charges. I may sanction a charge which a legal gentleman versed in criminal law may find to be defective; but if it is my own charge I have naturally a feeling of desire to support my own charge and to hold it to be right, whereas if the charge were drawn by some one else, and the objection were taken by some one else, I could then approach it with through and entire impartiality, and decide the thing strictly according to law.

4145. (*Chairman.*) Seeing that in India they have not access to your office, I presume you think that in India it is still more necessary that there should be a legal department similar to yours?—In India I think it is most important that a change should be made. I may state that the Indian trials are conducted no doubt with extreme care and very minute accuracy and with an amount of painstaking industry which is highly creditable; but I think that the administration of justice in India suffers very much from there being no civilian connected with the Judge Advocate-General's department in the same independent position as the Judge Advocate-General holds in England, and I have felt it my duty to correspond with the Secretary of State for India, and with the Commander-in-Chief with reference to it, and I may state that the Secretary of State for India has communicated both with Sir William Mansfield and with the Governor-General of India and sanction has been obtained that when any vacancy takes place in the appointment of Judge Advocate-General in India the post will be held by a lawyer, who will receive a higher salary, and who will occupy a higher position than the Judge Advocate-General has hitherto occupied in that country. That arrangement has received the sanction of the Secretary of State for India and it will be carried out as soon as a vacancy occurs in the office of Judge Advocate-General.

4146. Have you any further suggestions to make as to the official duties of the Judge Advocate-General?—I think that there is a great advantage in the position which the Judge Advocate-General occupies, feeling that he is responsible to Parliament for every case that comes before him, and I think it is very desirable that a person holding that post should occupy the independent position which the Judge Advocate-General does.

4147. Have you any suggestions to make to the Commission with regard to the constitution of general courts-martial?—With respect to courts-martial generally, I would observe that I think it would be very desirable to reduce their number to two. At present there are five court-martials of various kinds. I would have a general court-martial to try all cases of officers and all grave offences. I would abolish regimental courts-martial, giving greater power to the commanding officer, and then I would have a minor court-martial (whether it should be called a district, or a garrison, or a brigade, court-martial, I care not,) to try lesser offences which are not tried by general courts-martial. With respect to the general court-martial, I should like to see the number of officers who compose it very much reduced. The number of officers was 13, but by the Mutiny Act and the Articles of War of this year it has been reduced to nine. For my own part I should like to see it reduced, certainly, to seven, and possibly to five; my own opinion would be in favour of five, but with the experience we have of the Jamaica cases on Ensign Cullen and Assistant-Surgeon Morris, and which I think I may say were most admirably tried by a court-martial of seven, a reduction to that number might certainly be adopted. If five seems a small number it is to be borne in mind that according to the present law it is a very common practice to put one or two more members to sit on the court in the case of vacancy occurring. We had, I think, two extra members on the Jamaica court-martial, because, if the number was reduced by illness or death, the court could give no finding. That is a point on which I should like to make a change. I would have a quorum, and I would say still, that if the number were reduced by illness or death, if it were reduced to five, for instance, the court should still sit and find in the case.

4148. (*Lt.-Gen. Peel.*) But the Jamaica court-martial is hardly a precedent, is it; were not the officers specially selected to be sent out there and were they not rather superior?—The officers were specially selected from England, and they were undoubtedly rather superior, but at the same time I think the sense of responsibility is much greater the more you diminish the number, and I should be very glad to see nine reduced either to seven or to five.

4149. (*Chairman.*) With regard to the presidents, would you suggest any alteration in the mode in which the president of a court-martial is appointed?—Yes, I should have a number of officers appointed as permanent presidents of courts-martial, who had been trained in military law, and had undergone an examination in military law, and who had served first as presidents of district courts-martial, or brigade courts-martial, or whatever you may term them. Many members of the Commission will be perfectly well aware of the great advantage which has resulted in the House of Commons from the chairmen's panel of Election Committees, from having a panel of chairmen for the trial of railway Bills, and from having a number of the members of the House who act as chairmen of turnpike Bills; and I think, in the same way, that if you had a number of trained and experienced presidents to preside over courts-martial, you would have a uniformity of practice and a continuity of decision which would be very valuable with regard to the administration of justice.

4150. Would you confine that to general courts-martial, or would you apply it to district courts-martial also?—I am speaking at present of general courts-martial, but the same observation would apply to district courts-martial. In fact, I think the permanent presidents of general courts-martial would be selected from those who had proved themselves able presidents of district courts-martial.

4151. (*Lt.-Gen. Peel.*) But in the House of Commons to which you have referred, people are always on the spot, are they not, so that there is no difficulty in at once appointing him?—No doubt some difficulty might occur at remote commands, but within the United Kingdom, and probably in most of the colonies, there would be no very great difficulty in finding a number of trained men to act as presidents.

4152. Would you appoint specially, exclusive of regimental duties, a set of men as presidents of courts-martial?—I do not think I have sufficient military experience to say how I would find them, or whether I would remove them from their commands or not. They might be like the three officers who at present act in the United Kingdom as district Judge Advocates, and who, I believe, are all half-pay officers.

My military experience does not enable me to prescribe the precise mode of carrying it out.

4153. Would it not cause additional expense?—I have no doubt that it would, but I think if it is desirable, as I believe it is desirable, to improve the administration of justice in the army, the nation will be prepared to pay the increased expense.

4154. Have you formed that opinion which you have expressed from any deficiency you have found in the presidents of courts-martial?—It is invidious to point to the deficiency, but as a matter of fact I state that day by day, and week by week, I have to write letters with reference to the irregularities that occur upon trials.

4155. (*Viscount Eversley.*) Would you not obtain nearly the same object if you multiplied the number of Deputy Judge Advocates?—With respect to that, I may say that I would strengthen the court in two ways. First of all I would strengthen the court by having a permanent president, as far as possible. In order to meet the feelings of the army, the president of the court should remain, as at present, a military man; and then my own preference would be for a legal Judge Advocate; but then there would occur, no doubt, two considerations, namely, the feeling of the army as to the presence of a lawyer acting as assessor of the court, and the question suggested by General Peel of the expense; because I presume that if you had a lawyer as Judge Advocate he would expect a much larger salary than is at present paid to the military Deputy Judge Advocates. A question was asked with reference to any failures on the part of presidents of courts-martial; and my suggestion of a barrister to act as district Judge Advocate might seem to imply that I saw some deficiency in the able military gentlemen who are at present acting as district Judge Advocates in the United Kingdom; but that is not the case. In fact, I myself have derived very great assistance from the presence of the Deputy Judge Advocate in London, who is constantly at my office, and to whom I can always have recourse in questions turning upon the custom of the service and the feelings of the service; but at the same time I think, upon the whole, that a barrister with more entire legal training and more judicial habits of thought would be likely to give greater regularity to the proceedings of courts-martial, and to give, therefore, greater satisfaction to the public.

4156. (*Lt.-Gen. Scarlett.*) Do you allude to district courts-martial as well as to general courts-martial in that observation?—I have been speaking, as I said before, at present, entirely as to general courts-martial. My idea is that if there were legal Deputy Judge Advocates they should attend any trial at a district court-martial where the officer who convened the court thought it important that a legal Judge Advocate should attend; and that they should in all cases read the proceedings before confirmation by the confirming officer; but having reference to the very simple nature of a number of the trials, such as those for habitual drunkenness, and for making away with necessaries, and things which really involve no law, and where the evidence is very simple and the proof is very clear, I think that it would be unnecessary that they should attend all district courts-martial.

4157. (*Lt.-Gen. Peel.*) Do you agree with Mr. Vernon Harcourt that if those officers were appointed the Judge Advocate-General's office might be done away with altogether?—No, I think that the Judge Advocate-General would remain as a court of appeal, and I think that when the number of courts-martial, and the delicate cases which arise on courts-martial, and the intricacies of courts-martial are considered, it is very advantageous that there should be an individual holding the high position that the Judge Advocate-General does, who is entirely independent of the military authorities, who may take a thoroughly impartial view of the case, and who is responsible to Parliament in every case which arises.

4158. Would you not make those permanent presidents and legal assessors perfectly independent?—They would be perfectly independent, but I cannot assume that they would always decide rightly, or that no questions would arise upon their decisions.

4159. By whom would the charges be drawn up if you had these legal assessors or permanent presidents?—The charges would be drawn up by whomsoever the prosecution was ordered. I have stated before that the conduct of the prosecution should be quite distinct from those who have to deal with the case judicially. It is provided now, under the 159th Article, that "No person acting as prosecutor or "being a witness for the prosecution shall also act as "Judge Advocate at a trial." In a trial at the Old Bailey, for instance, there is a clerk of indictments; there is a person whose business it is to prepare the charges, and there is a solicitor who gets up the prosecution; and then when the case is tried the court decides the points of law which arise, and if any decision of that court is challenged there is an appeal to some higher tribunal. So in this case there would be an officer attached to the Adjutant-General's office, or elsewhere, where the case for the prosecution might be got up and the charges prepared, and then the court would decide all points raised before it, and in case of an appeal the Judge Advocate-General would be the ultimate court which would review the decision of what I may term the court below, the court-martial.

4160. You wish to remove the duty of framing the charges in the first instance from the Judge Advocate-General's office where it now is, do you not?—Entirely.

4161. Then upon whom would you impose that duty?—I have suggested the Adjutant-General's office.

4162. You suggest, do you not, that there should be an additional legal assistant at the Adjutant-General's office where the charges are to be framed?—Yes.

4163. In addition to the permanent president and the legal assessor to the court?—It may either be done by any legal adviser attached to the Adjutant-General's office or the case for the prosecution may be got up by the solicitor to the War Office, as cases for prosecution at the Old Bailey are got up by any other solicitor. It is not so much that I would suggest that the prosecution should be got up in any particular place, as that the conduct of the prosecution should be entirely removed, either from the Judge Advocate, who has to advise the court at the trial, or from the Judge Advocate-General, who has to review the proceedings of that court. I think being interested in any way in getting up the case for the prosecution is entirely incompatible with the independent and impartial discharge of his judicial duties by the Judge Advocate or the Judge Advocate-General.

4164. (*Capt. Vivian.*) You propose, do you not, that those new courts should be presided over by permanent presidents?—Yes.

4165. Would you propose that the courts should sit in permanence?—No, the courts would sit as trials arise from time to time.

4166. For how long should the permanent presidents be elected?—They might be for five years, or any shorter period.

4167. Then you propose that in each district there should be an assessor, whose duty it would be to attend upon the court and to assist them with all necessary legal advice, so as to keep them strictly to military law?—Yes.

4168. And you still think, nevertheless, that those proceedings should be subject to the revision of the Judge Advocate-General?—I think so.

4169. (*Chairman.*) You have nothing in any way whatever to do with the appointment of prosecutor, have you?—Nothing.

4170. You do not even advise as to who shall be appointed prosecutor?—No.

4171. (*Lt.-Gen. Scarlett.*) Have you power to select a legal Judge Advocate in intricate cases, or

The Right Hon. J. R. Mowbray.

25 May 1868.

in cases where lawyers are appointed on both sides, instead of appointing one of your usual Judge Advocates?—It is for the reason that in a difficult case as things are now it is necessary to have a double agency, that I suggest that an acting Judge Advocate should be a barrister.

4172. But you have the power to appoint one now, have you not?—I will take the Jamaica case as an illustration. The military Judge Advocate who was sent out by the Horse Guards was a very efficient gentleman, but the case was so extremely difficult that I suggested that a barrister should also accompany him, and I prevailed upon a very learned gentleman to go out and undertake that task. The fact was that there were two persons on that occasion representing the Judge Advocate-General's department. There was the military Judge Advocate, and there was the legal Judge Advocate. What happened at the trial was this: that the legal Judge Advocate was the gentleman who really advised the court, who prepared the summing up, and who advised on every question of examination or cross-examination; but of course the summing up was read by the military Judge Advocate; and therefore there was a double agency, which was expensive, and I suppose, to some extent, inconvenient. It worked very well and very harmoniously in that case, but I can conceive cases in which it might not work harmoniously.
